crimination in government and industry; extension of unemployment compensation benefits to 26 weeks with a ceiling of \$22 per week; Rutgers university was given the status of a state university; and a state fund was created to finance returning veterans up to \$3,000 in the establishment of small businesses. (W. R. Ck.; X.)

In 1946, Alfred E. Driscoll, the Republican organization candidate, defeated former Governor Harold G. Hoffman in the June primary and in November was elected Governor of New Jersey over Judge Lewis G. Hansen, his Democratic opponent, by 122,000. Election of Driscoll was the first time the Republicans had held the Governor's office for two successive terms after 1909. The Republicans also increased their pluralities in the legislature, controlling the 1947 assembly by 48 to 12 and the senate by 16 to 5. Re-election of United States Senator H. Alexander Smith continued two Republicans in the senate from New Jersey, and the G.O.P. retained 12 of the state's 14 congressional representatives.

Legislation was passed in 1946 permitting the state government to seize and operate all public utilities in which service was interrupted or threatened by virtue of labour disputes, the first such legislation in the United States. As a result, when workers in nine gas production plants went on strike against utility management, the state took over and operated the plants successfully with their regular personnel. Later in the year other strikes in the same plants found the employees unwilling to work for the state, but under Governor Walter Evans Edge's direction full production was maintained and within a few days the men were back at work, the issues at stake going to arbitration.

Other legislation included repeal of the intangible personal property tax and its replacement by a net worth tax; initiation of two major north-south highways traversing the state, increased state road aid to counties and extension of the juvenile delinquency act to 18 years of age.

(W. E. EE.)

New Mexico

Fourth largest state in the southwestern United States, popularly known as the "Sunshine state," New Mexico was admitted to the union in 1912. Area 121,666 sq.mi., including 155 sq.mi. of water. Population (1940) 531,818 (25.6% increase after 1930); rural 355,417, urban 176,401; native white 477,065, Negro 4,672, foreign born 15,247. Capital, Santa Fe (20,325). Other cities: Albuquerque (35,449); Roswell (13,482); Hobbs (10,619) and Clovis (10,065). On July 1, 1944, the bureau of census estimated the population of the state at 532,212.

In 1937 the administration of the state was Democratic. The chief officers were: governor, Clyde Tingley; lieutenant governor, Hiram M. Dow; secretary of state, Mrs. Elizabeth F. Gonzales; auditor, Jose O. Garcia; treasurer, James J. Connelly; attorney general, Frank H. Patton; superintendent of public instruction, H. R. Rodgers. The national representatives were Senators Carl A. Hatch and Dennis Chavez and Representative John J. Dempsey.

In 1938, John E. Miles (Dem.) was elected governor. Other state officers elected with him were as follows: lieutenant governor, James Murray, Sr.; secretary of state, Jessie M. Gonzales; auditor, E. D. Trujillo; treasurer, Rex French; attorney general, Filo Sedillo; superintendent of

public instruction, Grace J. Corrigan and commissioner of public lands, Frank Worden.

In the presidential election of 1940, Roosevelt received 103,699 votes as against 79,615 for Wendell L. Willkie.

Legislation of 1941 provided for airport zoning regulation, prohibition of liquor sales near army posts, permissive municipal slum clearance, the teaching of Spanish in the fifth to eighth grades under certain conditions, a public service commission, a board of examiners in the basic sciences for practising the healing art, and a state guard. The state merit system commission and legislative reference bureau were abolished. A special appropriation of \$750,000 was made for national defense to be expended by the state finance board.

The chief officers of the state elected on Nov. 3, 1942, were: governor, John J. Dempsey; lieutenant governor, James B. (Jawbone) Jones; secretary of state, Cecilia Tafoya Cleveland; auditor, J. D. Hannah; treasurer, Guy Shepard; attorney general, Edward P. Chase; superintendent of public instruction, Georgia L. Lusk and commissioner of public lands, H. R. Rodgers. U.S. senators were Carl A. Hatch and Dennis Chavez; representatives, Clinton P. Anderson and Antonio M. Fernandez. The administration, legislature and congressional representation continued to be Democratic.

Legislation enacted in 1943 included measures to equalize state employees' salaries; to forbid legislators to hold additional state jobs; to provide child vaccination against diphtheria; to permit limited child labour under the age of 16 during World War II; to create a state purchasing agent; and to levy a tobacco tax for needy aged people's support.

Principal state officers elected on Nov. 7, 1944, were: governor, John J. Dempsey; lieutenant governor, James B. Jones; secretary of state, Cecilia Tafoya Cleveland; auditor, J. D. Hannah; treasurer, Guy Shepard; attorney general, Clyde C. McCulloh; superintendent of public instruction, Georgia L. Lusk and commissioner of public lands, John E. Miles. The 1944 presidential vote in New Mexico was: Democrat, 81,389; Republican, 70,688.

In 1945 a juvenile court was established in each county in the state, a bounty was granted on predatory animals, and Aug. 3 was declared "Ernie Pyle day." John Bingham replaced Guy Shepard as treasurer of the state. Administrative, legislative and congressional officers continued to be all Democratic.

The chief officers of the state elected in the 1946 elections were: governor, Thomas J. Mabry; lieutenant gov-

New South Wales

New South Wales is a self-governing state within the commonwealth of Australia with such residual powers as not expressly transferred to the commonwealth by the Commonwealth of Australia Constitution act and other statutes. Area: 309,432 sq.mi.; pop. (1937 est.) 2,735,700; (1946 census) 2,925,600. Chief towns: Sydney (cap., 1,398,000); Newcastle (127,660); Wollongong-Port Kembla (44,000); Broken Hill (26,500). Language: English. Religion (1933 census): Anglicans 1,143,000; Roman Catholics 556,000; Presbyterians 258,000; Methodists 203,000; other Christians 123,000; nil or not stated 297,000. Governors: Lord Wakehurst (April 1937–March 1946); Lt.-Gen. John Northcott (after March 31, 1946). Prime ministers: Bertram Sydney Barnsdale Stevens (later Sir Bertram Stevens) (May 16, 1932–Aug. 5, 1939); Alexander Mair (Aug. 5, 1939–May 16, 1941); William John McKell (after May 16, 1941).

By 1937, the depression of the early '30s had passed and the last of the emergency economies imposed during the depression were lifted. Both unemployment relief payments and unemployed relief works were diminished and

normal public works expanded. State taxation was reduced and a balanced budget achieved. Concurrently the state government initiated a social betterment policy including a new scheme of social aid to rehabilitate and not merely relieve the residual unemployed; housing improvement and development of co-operative building societies; and extension of local government and of community services. In 1937 (after 30 years of dual systems) state living wage determinations were discontinued, and basic wage determinations of the commonwealth arbitration court were made applicable also to industrial awards under state jurisdiction.

A sudden and very heavy fall in world prices of wool late in 1937 and of wheat in 1938 followed by an unfavourable season caused a minor economic recession in 1938–39. Differences of opinion as to appropriate remedial measures arose between commonwealth and state and caused the shelving of plans for an active resumption of immigration, the state asserting that migrants could not be assimilated except under conditions of full employment.

The recession of 1938–39 with its financial and industrial problems led to political differences culminating in the resignation of the premier (B. S. Stevens, later Sir Bertram Stevens) on Aug. 5, 1939, after more than seven years in office. He was succeeded by Alexander Mair, leading a new coalition of the two parties which remained in office until it was defeated at the general election of 1941 by the Labour party under the leadership of W. J. McKell, who became premier on May 16, 1941, and was again returned at the general election of 1944.

Rates of state taxation, which had been increased in 1939, were again reduced in 1941, and in the early years of World War II a number of important civil measures were adopted, including the raising of the school leaving age from 14 years in 1941 progressively to 15 years in 1943, a scheme of pensions for aged coal miners in 1941, factory welfare measures and extended workers' compensation, and compulsory insurance of motor vehicles against third party risks.

But from the outbreak of World War II in Sept. 1939 the state government restricted its civil activities to the most essential functions and transferred many of its officers to war duties with the commonwealth or to organizations such as air-raid precautions instituted by the state as agent for the commonwealth.

In 1942 the state government legislated to transfer certain powers to the commonwealth for a period of five years for purposes incidental to the war and to postwar reconstruction. This legislation was inoperative because of the failure of some other states to enact similar laws. Referenda seeking to confer the relevant powers on the commonwealth were rejected by the electors in 1944. In 1942, also, all states refused assent to taxation proposals made by the commonwealth and the commonwealth government under wartime powers enacted a series of measures implementing a policy (known as "uniform taxation") whereby the commonwealth became sole authority for levying income tax for the period of the war. This raised constitutional controversy, culminating in an appeal by four states (not including New South Wales) to the high court of Australia, and resulted in a judgment which established that the commonwealth parliament had sufficient constitutional power to make laws which might enable it to continue indefinitely (if it so desired) as the sole authority levying income tax in Australia. Three years later (toward the end of 1945) the commonwealth government announced its intention so to continue, and in the following year enacted laws which provided *inter alia* an annual reim-

bursement payment for an unlimited period to states that did not levy income tax, beginning with the fiscal year 1946-47. While the principle was not agreed to by the state, the basis of reimbursement was arrived at in conference between commonwealth and states. In the existing circumstances these laws and the system adopted precluded states from determining and levying income tax and made all Australia subject to one tax on income determined by the commonwealth parliament.

The period 1937-46 closed with the evolution of commonwealth-state financial (and other) relationships entering a phase in which the original conception of federation might be substantially modified. Despite state resistance to extension of commonwealth authority and unwillingness of the electors to give direct approval to major extension of commonwealth powers, the electorate had given both direct and indirect approval to extension of commonwealth control over governmental finance and had tacitly accepted its implications in regard to policy. Nevertheless, strong differences of opinion remained as to the desirable line of demarcation between commonwealth and state powers.

With the approach of the end of the war in 1945, the state revived its suspended policy of social improvement and economic development and plans for postwar reconstruction were adopted. In 1945 an act of parliament provided that two weeks' annual holidays with pay should be allowed to all employees; workers' compensation was again liberalized; the functions of the housing commission (set up in 1942) were expanded; measures for modern town

planning were enacted; regional planning and development were instituted; a state electricity commission was appointed to co-ordinate and extend electricity supply, and a ministry of conservation of soil and water was established.

Despite the rapid completion of demobilization, by Oct. 1946 full employment was maintained, but with a general shortage of labour, particularly acute in respect to women and juveniles. The state was collaborating with the commonwealth in measures to maintain full employment and to encourage immigration to relieve the labour shortage and promote development. (See also AUSTRALIA, COMMONWEALTH OF.) (A. W. S.)

Newspapers and Magazines

The story of U.S. newspapers and magazines during the decade 1937-46 is so intertwined with social, political and economic events that it can scarcely be isolated for examination by itself. For these periodicals, whether looked at internally or externally, it was a decade of superlatives. As background for the story of publications, the decade was overshadowed by these aspects: (1) The decade brought a four-year war winding up a ten-year world war, involving the U.S.'s greatest war effort, with the largest

army, the largest navy, the largest air force; the greatest public expenditures, taxation and public debt; the largest war production, involving almost complete conversion of industry to war work; the greatest repercussions on civilian life, the largest war casualty list; and the adventure of fighting two wars on fronts thousands of miles apart. (2) There were unprecedented social, economic and governmental changes; as "the decade of the common man" it saw much labour unrest and continuing periods of strikes and controversies in many fields (in the newspapers, not only the International Typographical union of mechanical workers but also the guild of newsmen); it saw fundamental changes in the U.S. governmental system involving the growth of federal power at the expense of local and state government; it saw much experimentation with governmental social and economic controls—of wages and hours, price and production levels, governmental invasion of the smallest economic spheres; it saw the building of the greatest bureaucracy and the levying of federal taxes on a scale never before dreamed of. (3) The decade saw the longest presidential term in U.S. history, the last 9 years of the 12-year term of the first president to serve more than 8 years, violating the third term tradition and then the fourth, with consequent weakening of the opposition party and serious threat to the two-party system—since a generation grew up knowing only one president. (4) The decade brought the end of a serious depression which faded out—just as in 1898—into the artificial prosperity of war activity and ended in a threat of dangerous inflation. (5) There was popular adaptation of many new inventions, such as the radio, the aeroplane, universal dependence on the motorcar, new uses of the internal combustion engine even by railroads. (In publication offices it took the form of teletypes, telephotos, radio news and pictures, photo offset printing, new printing and engraving processes.) (6) The decade brought a revolution in rapid communication creating a smaller world—traversed in minutes and hours by radio and planes, instead of days and weeks. (To newspapers this meant radio and aeroplane transmission of news and pictures and competition of radio in the sale of news.)

The newspapers and magazines mirrored this superlative decade. In turn, they were vitally affected and changed by it. The story of their part in it is so complicated that it is difficult to unravel the trends or threads, to distinguish the internal from the external.

The Decade Summed Up Year by Year.—Considered chronologically, the decade for newspapers may be summed up by high spots thus: 1937—the financial problems of "the recession," the beginning of rising wages and paper prices and the first flurry of guild strikes; 1938—Munich and the first try-out of the new foreign news-gathering machine; 1939—war news and increasing foreign coverage; 1940—expanding war, the selective service lottery and a presidential campaign involving the third term; 1941—war news stepped up by entrance of the United States in December; 1942—shortages of manpower and materials, conflicts with governmental agencies, all resulting from conversion of industry to war; 1943—paper shortage becoming serious, circulations rising, and editors worrying over restraints and threats to press freedom; 1944—a presidential campaign, war fronts spreading out thousands of miles; circulations rising to an all-time peak in spite of paper shortage; 1945—coverage of the ends of two wars around the world from each other, and later the beginning of reconversion and labour strife; 1946—paper shortage plus

rising prices, return of veterans to the offices, an era of strikes, and frantic efforts to check inflation that resulted from war savings versus lack of consumer goods.

U.S. Newspapers and World War II.—The citizens of the United States witnessed and enjoyed during World War II the best, quickest, most thorough and most accurate all-time news coverage of a war. Newspaper coverage of World War II was strikingly different from that of World War I. The outbreak of war in 1914 had caught U.S. newspapers almost completely unprepared; they had almost no foreign news-gathering organization because they had been getting their European news through exchange with British, French, German and other foreign news agencies—with all the implications of censorship, propaganda and government control that involved. As wireless was in its infancy and radio had not been invented in 1914, newspapers were dependent on cable transmission—so that, when the British cut the German cables, U.S. newspapers were restricted to the British version of the war, with only dribbles of news from Germany. Lacking a co-operative foreign news machine then, newspapers differed greatly in war coverage, and exclusive news beats were common. Dissatisfied with the sorry foreign news situation in 1914–18, U.S. newspapers cancelled their exchange relationships with foreign agencies and set out to build a foreign news machine manned by hundreds of U.S. citizens stationed abroad as correspondents; newspapers did the job not as individuals but co-operatively through their press agencies—the Associated Press, the United Press and International News Service—so that all the news became equally available to even the smallest daily. The first threats of hostilities in the middle '30s found the newspapers well prepared; in fact, the news machine gave warnings of war long in advance.

The first real test of this foreign machine, after 20 years of building, was the Munich conference in Sept. 1938. On that one event, Associated Press sent 557,544 words by cable and radio telephone, ranging from 10,000 to 25,000 words a day and reaching 31,174 words on Sept. 26, as well as 80 radio photographs costing \$90 each; other services attained similar totals, and the story was handled by the largest group of correspondents ever assembled. The huge cost was borne co-operatively by the entire daily press. Through 1939, during "the war of nerves," the news machine functioned effectively from news centres in London, England, Paris, France, and Amsterdam, Neth.; it was weak only in the U.S.S.R., the Balkans and eastern Europe, where censorship checked accurate reporting. The number of correspondents ran into the hundreds, daily files ranged from 25,000 to 40,000 words for each service and daily costs rose to \$6,000, resulting in assessments of 15% to 25% on U.S. newspapers. Cable crowding shifted the news centre from London to the United States so that France received its war news from New York via wireless. When Germany invaded France and the Low Countries in May 1940, Adolf Hitler's armies swept out the U.S. news machine, and from then through 1941, U.S. war reporting was greatly handicapped, being forced to clear through Berlin, Germany, Rome, Italy, and Vichy, France, under severe censorship and controlled communications set up by the propaganda machines of the dictators. Reporting became a matter of weighing communiqué against communiqué, but even Great Britain received its best war news from New York. Costs for each of the press agencies ran above \$1,000,000 a year, and daily cable and wireless tolls of \$5,000 were usual.

Formal U.S. entrance into the war in Dec. 1941 caught scores of correspondents in Germany, Italy, Japan and

China, and they were interned along with diplomatic corps. Through 1942 and later, with the U.S. facing two enemies, the correspondents trooped into the Pacific; their activities spread all over the world as they joined the fighting men in planes, tanks and warships. During the invasion of Africa, Sicily and Italy in 1942-43, not only were the correspondents with the troops, but a press mobile wireless transmitter went along to send their reports to New York; meanwhile newspaper men went ashore with the troops who were retaking Pacific islands from the Japanese. During the peak of the two-front war in 1943, so many correspondents were killed that newsmen were ordered not to take unnecessary risks, while others added to their glory by "keeping the secret" of military movements and of the journeyings of President F. D. Roosevelt to conferences at Casablanca, Cairo and Tehran. With the invasion of Normandy in June 1944, some 450 newsmen went ashore with the troops; shortly a press mobile transmitter, reporting to New York, was trailing close behind the tanks as they drove the Germans out of France. Meanwhile, 100 correspondents and a mobile transmitter were facing the risks involved in the recapture of Leyte and Luzon, in the Philippines. Newspaper men called 1944 "the biggest headline year in history," but "the week of weeks" was in 1945—April 28 to May 4, when the headlines read "Munich Revolts," "Mussolini Killed," "Reichstag Seized," "Hitler Suicide," "Italy War Ends" and "Hamburg Falls." With the ending of the two wars in May and August 1945, respectively, the news machine was pitched to such high speed that it could not await the slower official announcements but "jumped the gun" on the "final peace flash" of both wars—just as United Press had done in 1918—although it had "kept the secret" of the atomic bomb until President Harry Truman announced the Hiroshima raid from his ship in the Atlantic.

Watching a War Blow by Blow.—In retrospect, the operation of the U.S. news machine was as miraculous as the mobilization of U.S. production and military resources; no other nation had ever seen anything like it, and no newspaperman had even dreamed of it in previous wars. The result was that people of the U.S., through newspapers and radio, watched World War II as no people had ever watched a war before, from ringside seats, noting and discussing the fighting blow-by-blow, shot-by-shot, sometimes only a few moments after the fighting men saw the event. One Sunday afternoon all the U.S., sitting before radio sets, "watched" a German pocket battleship go to destruction in a South American harbour; on another they "saw" the Jap bombs falling on Pearl Harbor—as if through binoculars. There were errors and false alarms; censorship and propaganda at times clouded the picture before they cancelled each other; but largely the report was complete, accurate and amazingly rapid. Throughout, the activities of newspapers and radio were so co-operatively linked that it was impossible to assess proper credit to either. But it may be said that, although the U.S. had to wait until the writing of the history books to learn all the facts of World War I, the history books of World War II could be written from the newspaper and radio files.

Use of New Devices.—New tools and processes were largely responsible for the news coverage of World War II. Radio and wireless almost put the cable into the discard. Air transportation of reporters, copy and pictures reduced time and distances. The telephoto, first by wire and cable, later by wireless, brought battle pictures right along with the copy. But three new operations were most responsible: (1) the concentration of all news-gathering efforts in the three press agencies, A.P., U.P. and I.N.S., and the pooling

Staff workers at the news desk of *Stars and Stripes*, the U.S. army's European daily, in the offices of the *Times* of London

of all their efforts; (2) the development of the 400-watt mobile radio transmitters, financed by Press Wireless—an organization of 65 newspapers and 3 press agencies—which trailed the armies in Africa, Italy, France and the Philippines, and provided independent transmission of 16,000,000 words of news that would otherwise have been delayed or crowded off the cable and wireless kept busy by the military; (3) the development of the public relations corps in the army and navy, together with the marine corps "combat reporter" group. Organized originally in 1940 to sell selective service to the U.S. public, the military public relations activities were extended during the war to a degree that was of great assistance to the newspapers, besides publishing 600 army post newspapers for the fighting men.

The printing of overseas editions by newspapers and magazines was a new wartime phenomenon. A Hawaiian edition of the *Chicago Tribune* was started in Dec. 1944, with plates flown over. At least 27 magazines printed lightweight editions for aeroplane delivery abroad, including *Time*, *Newsweek* and *Reader's Digest*. The *New York Times Overseas Weekly* was issued in 1945 in Manila, P.I., and ten other foreign capitals. In 1945 *Chicago Tribune* overseas editions appeared in Manila, Bremerhaven,

U.S. newspapermen outside the "Press Club" on Guadalcanal in the Solomon Islands in 1942

Germany, and Tokyo, Japan. The Paris edition of the *New York Herald Tribune*, suspended June 12, 1940, was resumed in Dec. 1944.

Free News Thwarts Press Control.—Censorship and propaganda did not prove to be the great evil that had been feared. By 1938, people of the U.S. had developed immunity against the propaganda of the dictators and laughed at it; and early in the war they discovered that censored communiqués from both sides, taken together, showed the truth between them; they learned that free communication with both belligerents disarmed censorship. The deportation in March 1941 of the heads of the Nazi Transocean News service operating in New York silenced one of the most active foreign propaganda voices. At times the U.S. army and navy were criticized for holding back the news—especially bad news—but newspapers defended such efforts to keep information from the axis. Strikingly, the United States did not repeat its 1917 plan of information control, but devised a new one.

Instead of imitating the Committee on Public Information, which had handled both censorship and propaganda during World War I, congress in 1941 separated the two functions into the bureau of censorship under Byron Price and the Office of War Information (OWI), later under Elmer Davis. Price, executive news editor of the Associated Press, was appointed director of censorship on Dec. 16, 1941, and was given drastic powers by congress on Dec. 17, but he immediately announced that censorship would be voluntary so long as newspapers and radio stations co-operated.

He gave out lists of news items, including weather forecasts, that should be withheld to avoid giving aid to the

axis, and the newsmen not only co-operated heartily but set up local agencies to enforce the plan.

As a result, there were no important conflicts or violations, and Price never used the drastic powers he had. The *Chicago Tribune*, which on Dec. 8, 1941, had dropped its policy of criticizing the war activities, was summoned before a federal grand jury in Aug. 1942 on the charge that one of its reporters, Stanley Johnston, had divulged confidential navy information in his report of the battle of Midway, but no indictment was returned. In Oct. 1943 the ban on newspaper and radio weather forecasts was removed, and in Dec. 1943 Price greatly liberalized the censorship code. He cut back his activities to a minimum in May 1945 and closed his office on Aug. 15, 1945. The OWI had a stormier career, because many in the newspaper profession opposed the imitation of dictator propaganda methods. They welcomed the reorganization under Elmer Davis in July 1942 and co-operated throughout that year. Conflicts arose in 1943, and in June congress reduced OWI domestic activities so that Davis closed 62 regional offices and dismissed 794 writers. He also created a newspaper advisory group and urged release of more official war news. In September he startled the country with a series of "horror pictures" of army casualties. In June 1944 OWI sent 450 writers to help cover the Normandy invasion. On Sept. 5, 1945, OWI was transferred to the state department, and Davis resigned shortly to return to the Columbia Broadcasting system as news commentator. Later, in 1946, some discussion arose over the refusal of A.P. and U.P. to have their news services used in a postwar foreign short-wave propaganda service similar to that of OWI during the war.

(See also CENSORSHIP.)

Editors' Fear of Press Restraints.—Related to censorship was some discussion of growing wartime controls by government. Almost every newspaper meeting of 1943 had "freedom of press" as its central theme, and various groups appointed special free press committees. A flurry resulted from limitation of press coverage of the United Nations Food conference in Hot Springs, Va., in March 1943. Again in 1944, argument arose over the United Nations Monetary conference in Bretton Woods, N.H., in July, and the Dumbarton Oaks peace meeting in August, but the United Nations conference in San Francisco, Calif., in the spring of 1945 freely admitted a large gathering of newsmen. Another aspect of censorship was the pride that newspapers took in keeping the secret of war activities widely known to them, even when released in advance: the Casablanca meeting of Pres. Roosevelt and Winston Churchill in Jan. 1943 was kept secret 32 hours; Roosevelt's southern trip of April 1943 was not mentioned although the silence embarrassed newspapers in cities that he visited; the meetings of Allied leaders in Cairo and Tehran in Dec. 1943 were kept secret although released in advance and broken by Reuters and Tass agencies abroad; the greatest secret of all was the development of the atomic bomb, which was widely known to newsmen but kept secret until Hiroshima in Aug. 1945.

All in all, the war saw surprisingly little conflict between government and the press. Although in Dec. 1941 congress revived and strengthened the old Espionage act and Trading with the Enemy act of World War I, there were no prosecutions, because there was no subversive press opposed to the war, like the Socialist press of 1917-18. Also there was no "jingo press" urging the U.S. into the war before Pearl Harbor; in fact, the press was united in warning against entrance into the war until the Japs forced the issue.

Death of 38 Correspondents.—The real drama of the newspaper coverage of the war was provided by the hundreds of correspondents—writers, photographers, radio men—who shared the dangers and hardships with the fighting men. In all, there were at least 600 to 800 of them, including 24 women, and their war dispatches through the press agencies alone totalled 270,000,000 words—exclusive of specials and independent writing. The rate of casualties among them was 22%, as against the 5% among fighting men. Their casualties, beginning in 1940, were totalled at the end of the war as 149, including 38 writers and photographers killed and 36 awarded the Purple Heart. Through 1942, the casualties included 10 killed, 33 wounded, 2 missing and 65 captured, of whom the Japs sent back 26 on the S.S. "Gripsholm"; 1943 added 5 more dead, 36 more wounded, 28 prisoners, 3 decorated, and 11 Liberty ships named after correspondents; 1944 raised the totals to 27 dead, 106 injured, 3 missing, 21 Purple Hearts and 6 other decorations. Most notable among the casualties were: Webb Miller, United Press European news manager, mysteriously killed near London in 1940; Ralph W. Barnes, *New York Herald Tribune*, killed in a bomber crash in Yugoslavia in 1940; J. B. Powell of Shanghai, rescued in 1942 but permanently crippled by Japs; Larry Allen, daredevil A.P. man captured at Tobruk in 1942; Vern Haugland, A.P. man rescued after 47 days' wandering in the New Guinea jungle following a plane crash; Raymond Clapper, columnist killed in a Pacific navy plane in 1944; Ernie Pyle, popular war columnist, killed

on Ie island, April 18, 1945. The most famous war picture was taken by Joe Rosenthal of A.P., showing marines planting their flag on Mt. Suribachi, Iwo Jima (see p. 332). By 1943, returned correspondents had published more than 100 "I seen it" books, and many were earning from \$100 to \$2,500 each for public lectures.

Newspaper Civilian War Activities.—No one knows how much newspaper space, energy and money went into the promotion of civilian war activities, but anyone who attended publishers' meetings during the war might have concluded that more was devoted to those tasks than to news coverage or to the financial job of keeping newspapers alive. At the end, it was announced that newspapers had printed \$130,635,459 worth of free advertisements for war bond sales, including 110,230 appeals totalling 78,000,000 lines—either printed free by the newspaper or solicited from business men. To Oct. 1945 newspaper carrier boys had sold 1,704,000,000 ten-cent war stamps—10% of all sold after Pearl Harbor. The first big war job was the costly news task brought by the draft lottery that initiated selective military service in 1940; even in the smallest newspaper office the staff helped local draft boards in assembling, sorting and publishing the lists. When the lottery affecting 17,000,000 men was held in Washington

Ernie Pyle, most famous of U.S. war columnists, with a group of marines during a brief lull in the battle of Okinawa. Pyle was instantly killed by Japanese machine gun fire on Ie Jima, April 18, 1945

on Oct. 29, the press agency wires devoted 17½ hours to carrying the 9,000 lottery numbers; then the news rooms correlated them with local lists and published many pages of names and numbers. Their reward was a temporary circulation gain of 25%. In 1941 the plan of enlisting newsboys as salesmen of defense stamps, started by the *Philadelphia Bulletin*, enrolled 1,000 newspapers and 500,000 carrier boys. By 1942, newspapers were devoting thousands of columns to such civilian war drives as air-raid precautions, civilian defense, sales of war bonds and stamps and rules of rationing and price control. A national scrap-metal drive, started by the *Omaha World-Herald*, collected 60,000 tons in Nebraska, then resulted in 16 newspaper leaders being enlisted by the War Production board to collect 4,000,000 tons; the drive netted 5,364,415 tons but cost 280,000 columns of free space. A common newspaper service was to send free subscriptions to local men in service. Some 300,000 carrier boys sold 547,188,878 war stamps in 1942 alone.

The Bankhead bill introduced into the senate in 1943 proposed to spend \$30,000,000 on newspaper advertisements of war bonds, but, while most weeklies favoured it, most dailies opposed it; it was finally shelved. After heavy support of the First War Loan in 1942, the newspapers carried 73,938 free ads, worth \$4,564,279 on the Second Loan in May 1943, and double that amount for the Third Loan in September; of these, newspapers donated 40% and merchants 60%. In August 1,600 newspapers in 27 states joined in a drive to urge farmers to cut 2,500,000 cords of pulpwood for war uses of paper and cartons. In November 1,100 newspapers co-operated to collect 8,000,000 tons of wastepaper. The war bond drives of 1944, the Fourth in March, the Fifth in August and the Sixth in November, were supported by more than \$400,000,000 in free advertisements in newspapers and magazines; some 9,600 newspapers used the treasury department mats. The Red Cross drive of 1944 enlisted another huge newspaper campaign. The greatest fund drive of all was the Seventh loan in the fall of 1945, and the sum of the free ads climbed to \$42,635,459. Behind these more concrete drives was a continuing educational effort through newspaper copy to guide the public in gasoline rationing, tire saving, travel limitation and the multitude of civilian responses to the war effort. Most newspaper groups abandoned their meetings in the spring of 1945 to save travel.

No very accurate record was kept of the newspaper contribution of manpower to military service. By Aug. 1941 the draft had taken 1,613 news and advertising men; by March 1942 the number was said to be 7,000. Occupational deferments were available, but few newspapers favoured them. The chief victims of the manpower shortage were weekly newspapers and small print shops, of which perhaps 10,000 out of 43,000 were forced to close. Meanwhile, women invaded the news staffs and publishing plants as never before, and newspapers urged schools of journalism to set up "accelerated programs" to make more available. Women acquired the nickname of "paper dolls" as the number of women in the congressional press gallery rose from 42 to 135; the United Press had women managers in 11 of its 66 domestic bureaus, and 81% of the students in journalism schools were women. In Oct. 1943 some 822 dailies reported 156 former employees killed in service, and about 40,000 employees in the army or navy.

By the spring of 1946, the veterans were flocking back to the jobs that had been held for them in newspaper offices, and the situation was returning to normal.

False Alarms.—The four "false alarms" of World War II were: (1) on June 3, 1944, three days before D-day of the Normandy invasion, an Associated Press girl teletype operator practising her signals in London transmitted a false invasion report which made a few editions; (2) six newsmen were suspended by the army for a jubilant uncensored broadcast over Radio Paris on Aug. 25, 1944; (3) on May 7, 1945, Edward Kennedy of the Associated Press sent a premature announcement of the German surrender at Reims one day ahead of the official government release; (4) following a false peace rumour from the San Francisco conference on April 28, the United Press on Aug. 12 carried a "false flash" prematurely announcing Japanese surrender, but only radio carried it—an extensive search failed to discover how it got on the teletype network.

After the war was over, many newspaper war news activities continued. To impress on U.S. minds the picture of nazi atrocities, the war department took 17 newspaper and magazine editors to Germany in April 1945 and their eyewitness accounts of the murder camps flooded the press with many atrocity photos. At least 1,800 newspaper and radio reporters attended the United Nations conference in San Francisco, Calif., April 25–June 26. The *New York Times* devoted a 16-page supplement to the entire 130,000-word Pearl Harbor report. The Nuernberg trial of German war criminals opening on Nov. 20, 1945, and extending well through 1946, drew a gallery of 325 correspondents including 100 Americans.

Opposition to Roosevelt.—Persistent conflict between the U.S. daily newspapers and the White House coloured the decade until the U.S. entry into the war late in 1941. Although Franklin D. Roosevelt started in 1933 with "a good press," he lost much of his newspaper support early in his first term—partly because the majority of the dailies were Republican, partly because many editors considered much of his New Deal was demagoguery, and partly because his behaviour in his press conferences antagonized many Washington correspondents. The opposition was seen much more in the editor's domain than in the publisher's office. The conflict was much misunderstood and misrepresented, because the limelight was centred on a few metropolitan Republican newspapers which persisted in opposing him while he was being elected largely by voters in their large cities; whereas in the smaller cities, where most of the dailies were published, all surveys showed a close correlation between newspaper attitudes and voters' behaviour. Probably the most striking aspect of the controversy was the evidence of the great change in U.S. newspapers in the previous half century—through the disappearance of the party organ newspaper. The result was the strange phenomenon of a newspaper opposing Roosevelt on its editorial page, but on its news pages giving such a fair and complete picture of his actions and policies that the voters re-elected him. During his several campaigns, newspaper men boasted that they had attained the ultimate in equal and fair news coverage for both candidates. Only a few newspapers, like the *Chicago Tribune*, fought him with every page.

Probably the most authoritative survey of daily newspaper support was made by the *Editor & Publisher* in 1946, when it obtained from 1,324 daily newspapers, representing 75.6% of the total number and 87.6% of the circulation, statements of their editorial page attitudes in his

←

four elections. The survey showed: in 1932, Roosevelt was supported by 38.7% of the dailies, Herbert Hoover by 55.5% and the other 5.8% were neutral. In 1936, some 34.5% supported Roosevelt; 60.4% supported Alf Landon and 5.1% were neutral. In 1940 (the third term election), only 20.1% supported Roosevelt; 66.3% aided Wendell L. Willkie and 13.6% were neutral. In 1944, Roosevelt had 22% of the dailies, representing 17.7% of the circulation; Thomas E. Dewey had 60.1% of the dailies and 68.5% of the circulation; the remaining 17.9% of the newspapers with 13.8% of the circulation supported neither. The rise in neutral newspapers was seen mainly in the south.

To some extent, U.S. newspaper attitudes toward Roosevelt reflected the impact of New Deal measures on the newspaper business. The Newspaper Guild, which started in 1934, grew out of the National Industrial Recovery act and the Wagner act. Many editors blamed Roosevelt for the "recession" of 1937. The Wages and Hours act of 1938, with its five-day week, was difficult for six-day newspapers, especially smaller ones. The new tax laws, the security levy and the pay roll deductions greatly increased bookkeeping. Federal bureaus, setting the minimum working age at 18, threatened the "little merchant" carrier-boy system of which newspapers were proud. Limitation of truck mileage during gas rationing handicapped newspaper bulk delivery which depended little on rail carriage. The New Deal and Roosevelt consistently favoured radio, and from 1941 to 1942, Federal Communications commission hearings badgered the newspapers that owned 249 of the 838 radio stations. Finally, the 1,285 newspapers that belonged to the Associated Press resented the lawsuit brought against their organization in 1942 by the federal department of justice. In all these things, the small newspapers were more disturbed than the large ones.

Two Elections.—The coverage of the two presidential campaigns during the decade resulted in more newspaper activity than during any previous elections. In 1940 the extended whirlwind campaign of Wendell L. Willkie, including almost hourly extemporaneous talks in addition to prepared speeches, was one of the most difficult ever reported. Near the end, when both candidates spoke almost daily, their words swamped the wires and newspaper pages. But whatever the editorial pages said, few front pages failed to report every important utterance of either contestant. On Nov. 5 newspapers threw their entire facilities into recording and tabulating the 50,000,000 ballots so that the outcome was announced by 10 P.M. and the newspapers co-operated fully with the radio in getting the returns to the public. (Figures on press support announced by *Editor & Publisher* in 1940 differed slightly from the 1946 figures quoted above because fewer newspapers responded.) In 1944 all records for press coverage of presidential conventions were broken by 900 newspaper and 150 radio men at the Republican convention in Chicago, Ill., on June 26 and by a press gallery of 778 at the Democratic convention in the same city on July 15. While President Roosevelt made no extended trip, more than 100 reporters accompanied Governor Dewey on a 6,700-mi. campaign tour, and 80 were on his special train when it was wrecked near Portland, Ore., on Sept. 19. The gathering of election returns from 130,353 voting precincts on Nov. 7 was complicated by 4,000,000 absentee soldier ballots; Associated Press alone used 65,000 persons and 285,000 miles of leased wire.

Associated Press Trial.—The newspaper legal battle of the decade was the antitrust suit against the co-operative

Associated Press, filed in 1942 by the federal department of justice. The case was in the courts for three years—reminiscent of the Chicago *Inter Ocean* suit which caused the dissolution of the old Western Associated Press and the incorporation of the Associated Press in 1900. The controversy grew out of the founding on Dec. 4, 1941, of the *Chicago Sun* to contest the morning monopoly of the *Tribune* and supposedly to support President Roosevelt's New Deal against the opposition of Col. R. R. McCormick. Although receiving its wire news from the United Press, the *Sun* early in 1942 applied for membership in Associated Press presumably to obtain its wirephoto service, and the *Tribune* exercised its right of protest as a member in the same local field. After hints of a federal suit, the A.P. on April 20 revised its by-laws to revoke the famous right of protest and to liberalize membership rules, but at the same meeting voted 684 to 287 against admitting the *Sun* (hinting resentment at government threats) and also voted down the application of Eleanor Medill Patterson's *Washington Times*. The justice department filed the suit on Aug. 28, charging A.P. with being a monopoly and citing the refusal of the *Sun*. The A.P. responded on Oct. 27, protesting that the suit would create a monopoly by destroying its competitors, the United Press and the International News Service, and would convert A.P. into a public utility to be regulated by government, in violation of the constitutional guarantee of the free press. On Oct. 29 the *Chicago Tribune* filed a separate answer, and later some 1,000 smaller newspaper members organized to file a third answer. On Jan. 7, 1943, three judges of the U.S. circuit court of appeals of New York—Judges Learned Hand, Augustus N. Hand and Thomas W. Swan—were named an "expediting court" for the case. At a special meeting on Feb. 9, the A.P. further eased its by-laws on admission of members. During the next six months the government presented 545 questions of fact and A.P. presented 40 questions—piling up a record of more than 2,000,000 words. Both sides agreed on May 29 to a summary judgment based on written evidence, filed their lengthy briefs and on July 8 argued the case in court. The majority opinion in the court's two-one decision, handed down on Oct. 6, stipulated revisions in A.P. admission rules to avoid the charge of "monopoly." Judge Swan dissented. The government filed its "proposed judgment for the court" on Nov. 12. During December various newspaper spokesmen urged A.P. to appeal the case, rather than file an answer, arguing that the decision tended to violate the sanctity of property rights in "copy." On Dec. 15 the *Sun* again applied for membership. The A.P., however, filed its answer on Jan. 3, 1944, and the court's final judgment on Jan. 13 stipulated radical changes in A.P. by-laws. Five days later A.P. decided to appeal; on March 9 the lower court granted the appeal; and on May 8 the U.S. supreme court accepted jurisdiction. Briefs were filed on Oct. 23 and Nov. 6; oral arguments were heard on Dec. 5-6; and eight justices took the case under advisement. The A.P. finally lost the case in a five-three decision of the supreme court handed down on June 18, 1945, reaffirming the Jan. 13, 1944, ruling of the lower court; each of the eight justices wrote a separate decision, totalling 22,000 words. A.P. directors on Sept. 7 filed a petition for rehearing but this was denied on Oct. 8, and a stay of 120 days was set for compliance. At a special meeting on Nov. 28, some 125 A.P. members with 948 proxies, revised the membership rules to conform, voted 949-34 to admit the *Sun* as an associate member (all it asked for), and voted 962-23 to admit the *Washington Herald*. (Col. McCormick seconded the motion to admit the *Chicago Sun*.)

The three-year legal battle had cost \$234,592 and left the A.P. with no recourse except appeal to congress to amend the antitrust law so as to further exempt co-operatives.

Other Legal Fights.—Another notable legal struggle concerned the magazine, *Esquire*, which Postmaster General Frank C. Walker in 1943 wished to bar from the mails on the charge of obscenity (the Varga nudes). After lengthy hearings, the postal board voted 2-1 to drop the charge, but on Dec. 30 Walker annulled *Esquire's* second class postal privileges, effective Feb. 28, 1944, on the grounds that the magazine was "not devoted to useful information" worthy of mail subsidy. After a court fight started in June and extending through the year, the U.S. court of appeals in June 1945 returned the second class rate to the magazine. The only other notable legal battles during the decade were a series of cases in which judges cited newspapers for contempt of court as the result of criticism of court verdicts: In 1940, the *St. Louis Post-Dispatch* and the *Los Angeles Times*, cited for criticizing "pending litigation," carried their cases through to victory in the U.S. supreme court on Dec. 8 and June 10, 1941, respectively; the *Miami Herald* (Fla.) in 1944 was not so fortunate. Newspapers applauded as a victory for press freedom the decision of the U.S. supreme court on May 4, 1943, annulling a city ordinance which restrained Jehovah's Witnesses from distributing their pamphlets. Unprecedentedly, on April 13, 1943, the U.S. district court of New York, on charges brought by the attorney general, fined 15 department stores \$80,000, under antitrust laws, for their combined action in withholding advertising from the *New York Times* in protest against raised rates—the grounds were that "readers feared the lack of advertising meant shortage of merchandise due to the war." (See also CIVIL LIBERTIES.)

Campaign for World Free Press.—U.S. agitation for "a world-wide free press" or international guarantee of free news communication—a movement proposed by Kent Cooper, general manager of the Associated Press—got under way in 1944. The American Society of Newspaper Editors on April 21 appointed a 14-man committee to push the idea. Planks endorsing the proposal were included in both Republican and Democratic national platforms; a resolution was circulated for adoption by state legislatures in August; both houses of congress endorsed it unanimously in September. A Commission of Inquiry on Freedom of the Press, consisting of 17 experts, was set up by *Time*, *Life* and *Fortune* magazines, aided by the University of Chicago, Chicago, Ill. A free press mission of three men delegated by A.S.N.E. started on Dec. 28, 1944, and spent three months visiting London, Cairo, Iran, Moscow, China, India, Australia, New Zealand and South America. A resolution was adopted at the Mexican conference in March 1945 and the plan was encouraged by the British-American Telecommunications conference in Bermuda in December. Press freedom was established by U.S. authorities in Italy, France, Germany, Austria, Japan and partly in South America, but in July, 100 correspondents sat outside the Big Three conference at Potsdam and the newspapers opposed a free press rider attached to the United Nations Relief and Rehabilitation Administration relief bill in congress. Much progress had been made by 1946, but there remained the firm opposition of the soviet union and the habits of old world leaders who still thought in terms of a controlled national press to provide propaganda for nationalistic governments. The next step in the plan involved a provision in the final peace treaty and the United Nations organization.

Newspaper-Radio Peace.—The 15-year-old conflict be-

Accredited war correspondents seated before Pres. Roosevelt and Prime Minister Churchill during an open air press conference at Casablanca in 1943

tween radio and the newspapers ended in 1937 with the settlement out of court of the \$1,700,000 suit of Transradio against 17 newspaper competitors. Two basic areas of conflict reached adjustment during the decade: it became evident that radio advertising was not materially reducing newspaper advertising—although it seriously damaged magazines—and it was discovered that radio newscasting stimulated “the appetite for news” and increased newspaper sales rather than reducing them. Belatedly in May 1939 Associated Press relaxed its rule forbidding broadcast of its dispatches; U.P. and I.N.S. had been selling theirs freely to radio for some time. The listening staffs set up in 1939 by the press agencies to glean elusive facts from foreign short-wave radio were shortly disbanded as useless. Some resentment resulted from the hearings started by the Federal Communications commission in March 1941, over the ownership by newspapers of 249 of the 838 radio stations, but the hearings were finally ended in Jan. 1944 without conclusion. Associated Press in 1941 set up a subsidiary, Press Association Inc., to sell radio news to non-members. The *New York Times* began news broadcasting over WMCA in Nov. 1941. By 1946, almost 200 newspapers had applied for permits to operate the new frequency modulation stations. All through the war, press and radio co-operated so closely that the public could not tell which to credit for the news. The intense interest in radio war news developed listening habits in the public that forced radio stations, after the war, to set up staffs for gathering local news, instead of borrowing from the press. In retrospect, one of the greatest effects of radio on newspapers was the stimulation of newspaper columnists to compete with radio commentators.

Financial Shoals.—In terms of internal problems, any newspaper publisher would say that the decade was a period of “hard times” and difficult financial crises. Shortages of materials and manpower, rising costs, reduced revenues and strikingly altered budgets kept publishers in faithful attendance at their association meetings to find some answers to their difficulties. Beginning with a “recession” in 1937 and the last four years of a long, hard depression, the decade shifted into a war period which accentuated the financial problems of the press—because newspapers, while notably changed by wars, never had made much money during wars. The postwar year 1946 offered a chance to make money, but materials were lacking.

Paper was undoubtedly the biggest problem of the business managers. There was plenty in 1937, but the price was rising; Canadian newsprint went up 17%, setting prices at \$48 or \$50 a ton. As a result, Texas publishers co-operated in building a \$5,000,000 plant to pulp southern pine; it got into production by 1940. Prices and supply held steady in 1938, 1939, 1940 and 1941, although other types of paper were becoming scarce during the latter year. By the end of 1942, paper shortage developed, economies began and chlorine shortage resulted in gray paper; the price was frozen at \$50 a ton, but in December committees from the newspapers were meeting in Washington, D.C., to plan rationing. In 1943, paper shortage resulted in a succession of cuts handled by a 25-man Newspaper Advisory committee, largely to protect smaller newspapers from the inroads made by rising circulations of metropolitan newspapers; four cuts ordered that year, on a sliding scale, reduced paper use 10% below 1941, and the Office of Price Administration authorized a price rise of \$8 a ton. For 1944 the cut ranged from 4% for weeklies

to 24% for large dailies; to save paper, newspapers were freezing circulation, raising sales and advertising rates, omitting classified advertising from mail editions, rationing advertising, reducing Saturday editions to eight pages and in some cases omitting advertising for several days at a time. Much discussion of possible use of 30-lb. paper (instead of 32) was heard, as well as of “ersatz” or de-inked paper. In spite of rising circulations, in 1944 rationing reduced consumption 17% below 1943, more devices to save paper were proposed, and even the smallest printing offices were rationed, but price was unchanged and 30-lb. paper was abandoned as uneconomical. Shortage continued in 1945, and two price rises carried to \$68 a ton; through voluntary rationing newspapers reduced paper use from 20% for the smallest to 37% for the largest, below 1941. On the plea of 85% of the press, all paper controls by the War Production board ended on Dec. 31, 1945, but newspapers started measures to avoid a mad scramble for paper and set up a share-the-paper plan through their associations. The year 1946 saw paper even more scarce than before and the price rose to \$75 a ton in August.

Advertising and Circulation.—Advertising held up through the decade better than anyone expected and supplied most of the money to pay for costly news services, thus saving U.S. newspapers from the political subsidies that had cursed the press of other countries. In that respect, advertising proved to be the bulwark of press freedom, providing stable financial support to pay the printer, with a minimum of outside influence. Attacks by consumers’ leagues that coloured the early 1930s gradually died away as advertising eliminated its more glaring faults; nostrums and quacks almost completely disappeared. In 1937, some 552 dailies banned liquor advertising, and 178 banned beer. Radio advertising, while materially damaging magazines, became less and less embarrassing to newspapers. During 1937, advertising declined slightly because of raised rates, and went down 13% more in 1938, forcing radical shifts in budgets; to revive advertising, 774 newspapers formed the Bureau of Advertising on a national scale. Advertising, down 34% since 1929, rose 2% in 1939; little change was seen in 1940, but the Continuing Study of Newspaper Reading was started and analyzed 24 newspapers to bolster advertising. Down somewhat in 1941, advertising held steady in 1942 and that year, because of shortage of consumer goods, it changed from “selling goods” to urging “wise buying” and “keeping the firm name alive for the postwar market.” National and classified advertising increased sharply in 1943, but local advertising declined somewhat; 1944, however, brought a 16% increase for smaller newspapers. Gains were widespread in 1945, and advertising soared with the postwar buying boom of 1946. Advertising evidenced at the end of the decade sounder, less objectionable practices than ever before.

Circulation totals soared and selling prices rose all through the period to record-breaking levels. The two-cent newspapers began giving way to three-cent and five-cent in 1937; subscription prices were raised in 1938; another sharp rise in prices came in 1942; by 1945 most newspapers were five cents a copy, and readers spent more than \$800,000,000 during the year for their newspapers. During the ten years the burden of circulation in the income budget rose from 10%-12% to 25%-30% on most newspapers. The steady rise of daily newspaper circulation totals was indicated by these figures from annual directories: in 1937 the 41,400,000 daily and 31,000,000 Sunday were the highest on record; reader reaction to raised prices

brought a decline of 4.4% in 1938; a rise of nearly 4% in 1939 regained some of the losses; another rise of 4.5% in 1940 showed mostly in the morning newspapers; interest in war news raised the total 2.5% daily and 4% Sunday in 1941; in spite of paper shortage, 1942 showed 2.35% daily gain and 7.15% Sunday rise, while New York city newspapers gained 400,000 to 10,000,000 copies daily; another gain of 2.6% brought the total to 44,000,000 in 1943; paper restrictions held that total through 1944; another 6.4% increase in 1945 raised the total to an all-time high of 48,384,188; no decline was evident through 1946. (See also ADVERTISING.)

Rising Wages and Strikes.—Manpower problems of the decade involved rising wages, shortage of help, strikes, greater employment of women, and the Newspaper Guild of Newsmen. Wages of all newspaper mechanical and editorial employees were rising and hours were being shortened through 1937 and 1938; a sharp rise of about 30% in wages came in 1939; the great struggle over shorter hours marked 1940; many small dailies became five-day newspapers in 1941; through the rest of the decade hours shortened and wages rose steadily, with a sharp upturn in the postwar years of 1945 and 1946. No notable strikes of mechanical workers were recorded until 1941; in October of that year seven major New York city newspapers were tied up by a news dealers' trade boycott; again in Dec. 1942 12 New York newspapers faced a three-day strike of newspaper deliverers. A series of strikes by mechanical workers, encouraged by new rules of the International Typographical union, began in 1944, and through 1945 such strikes were widespread and in many cases long and bitter, resulting in the common sight of newspapers being printed from photographic plates. Again in July 1945 17 New York newspapers were off the streets for 17 days because of a deliverers' strike. Early 1946 brought new I.T.U. wage demands which threatened a long and bitter struggle.

Most spectacular in the labour field was the story of the Newspaper Guild of newsmen. Launched in 1934 as a professional organization, in 1936 the guild became an American Federation of Labor union; in 1937 it shifted to Congress of Industrial Organizations and broadened its base by taking in business office employees to double its strength. In 1937, with 11,000 members and 50 contracts, it became belligerent and waged strikes in 9 newspaper offices; in 1938, the guild struck in 19 newspaper plants, battling especially with William Randolph Hearst. In 1940, its membership was up to 18,755 but it waged fewer strikes and its great leader, Heywood Broun, died on Dec. 18. One strike tied up the *Chicago Herald-Examiner* (Hearst) for 17 months and killed the morning edition. A house cleaning of the more radical and communistic elements was carried out in 1940 and 1941, with fewer strikes. By 1942, the guild was settling down, and signed a contract with the *New York Times*. Most of the struggle was over. In 1944, the guild had some 20,000 members, mainly in the larger cities and had become quite stable and accepted.

Improved Appearance.—Much change and refinement in the physical aspects of the newspaper came during the decade. Quite a revolution in make-up took place in 1938, with new streamline headlines, departmentalized news sections, more use of colour printing and much greater use of pictures, including extended use of the telephoto. All of this was handicapped by war conversion of industry. By 1942 no new presses, linotypes, typewriters or cameras were available, and all the metals needed in printing and photography became scarce. In 1945, Associated Press said

it had delivered 150,000 wirephotos in 10 years. But most notable was the gradual disappearance of sensationalism and crime news, and the increased seriousness of the news columns, with greater interest in editorial pages and columnists. Because of that fact, plus the excellent coverage of war news, and the outstanding newspaper war services, popular criticism of the press almost completely disappeared. An organized movement was launched to attain better public relations for newspapers; beginning in 1940, an annual newspaper week each October attracted thousands of visitors to newspaper offices.

"One-Daily Cities."—Much was written about "the disappearing daily" because of the decline in the number of daily newspapers—although paradoxically, as the grand total decreased, the directories recorded that more cities had dailies. The explanation was that economics was killing off the weaker second newspapers and increasing the number of cities that had just one strong newspaper, while in smaller cities weeklies were becoming dailies; by 1946, the number of "one-newspaper cities" approached 90% of all cities with dailies. By years the trend was as follows: the hard times of 1937 killed 23 dailies and reduced the total to 2,004, smallest in 40 years, but weeklies increased by 176 to 10,629, foreign language newspapers went up to 135, and Negro papers up to 214; in 1938, some 57 more dailies died; exactly 51 disappeared in 1939 but weeklies increased by 25, and the "one-daily cities" had grown from 353 in 1899 to 1,083 in 1939; few mergings and an increase to 2,015 marked 1940; the years 1941, 1942, 1943 and 1944 saw little change; the decade ended with 2,004 dailies and 10,430 weeklies, 283 semiweeklies and 35 triweeklies. The most noticeable casualties were among the "newspaper chains," especially Hearst and Scripps-Howard, because the new tax laws prevented strong chain members from carrying "weak sisters." Following the death of Arthur Brisbane on Dec. 25, 1936, William R. Hearst began shrinking his newspaper list; besides ending his Universal News service, he closed 5 newspapers in 1937, reducing his chain from 25 papers in 18 cities to 20 papers in 14 cities; in 1938 he set up a 10-year trust and sold 6 radio stations; in 1939 he disposed of 4 more newspapers; by 1946, he still owned 18 newspapers in 13 cities. The Scripps-Howard string disposed of 3 newspapers in 1938 and 4 in 1939, and ended the decade with 19 newspapers, the smallest number in many years. Although 1946 recorded 15% of the daily newspapers owned in groups, they were held by 56 groups, of which only 5 had more than 10 newspapers each. Negro newspapers, all weeklies but one, increased during World War II to 225.

Only two notable newspapers were launched during the decade—*PM* (Picture magazine), started in New York city in 1940 and the *Chicago Sun* in 1941. Both were started or shortly owned by Marshall Field. Famous newspapers that disappeared were: *New York* (morning) *American* in 1937; *Minneapolis Journal* in 1939; the 111-year-old *Boston Transcript* in 1941; the *Philadelphia Public Ledger* in 1941; *Kansas City Journal* in 1941; and *Milwaukee Post* in 1942. Other interesting changes were: the *Milwaukee Journal* adopted employee-ownership in 1937; the Western Newspaper union bought the *American Press* in 1938; Associated Press acquired the *New York Times Wide World Photo* service in 1941; John S. Knight bought control of the *Chicago Daily News* in 1944; and the *Chicago Times* adopted employee-ownership in 1944.

Greatest News Stories of the Decade.—Aside from the war stories, the following news events were important

enough to appear in the "Ten Big Stories" during various years of the decade: in 1937, President Roosevelt's supreme court battle, the C.I.O. steel strike and sit-down strikes in auto factories, the burning of the Zeppelin "Hindenburg" with 97 deaths, New London, Tex., school explosion, Amelia Earhart's disappearance on a Pacific flight, Ohio river flood; in 1938, New England's September hurricane, Douglas Corrigan's "wrong-way" flight to Ireland, Howard Hughes's flight around the world, Milwaukee railroad "Olympian" wreck in Montana, Orson Welles' radio "Invasion from Mars"; in 1939, death of Pope Pius XI and election of Pius XII, disasters of three submarines, U.S. "Squalus," British "Thetis," French "Phenix," visit of British king and queen to the United States; in 1941, the strike in captive coal mines; in 1942, Republican comeback in November elections, Eddie Rickenbacker's rescue at sea after plane crash, Boston Coconut Grove night-club fire tragedy; in 1943, pay-as-you-go federal taxes, Alfred De Marigny murder case, Errol Flynn trial; in 1944, Hartford, Conn., circus fire, Cleveland, O., gas explosion, trial of Charlie Chaplin on Mann act charges, eastern hurricane; in 1945, President F. D. Roosevelt's death on April 12, Labour party victory in British elections, crash of bomber into Empire State building in New York city, General Motors strike; in 1946, the Nuernberg trial and Goering's suicide, Republican landslide in November, U.N. assembly and Foreign Ministers' meetings in New York city, the Bikini atomic bomb tests. (See also CHRONOLOGY OF EVENTS.)

Ten Turbulent Years for Magazines.—Although less dramatic than the newspaper story, the adventures of the magazines and other periodicals during the decade evidenced more difficult problems, more struggle to keep alive, more drastic changes and more casualties in their ranks. Paper shortage and the inroads of radio on magazine advertising caused them most trouble. Their story may be told in chronological order:

The year 1937 witnessed the boom of picture magazines, the great development of the condensed pocket digest and the growing popularity of pulp magazines. The new *Life*, launched as a picture magazine in 1936, led the pack and was imitated by 20 others in 1937, including *Midweek Pictorial* and *Look*—circulations ran to 6,000,000. *Reader's Digest*, founded in 1922, still adless, and now up to 2,000,000, had 31 imitators in 1937, of which 15 promptly died. Pulp magazines increased to 150, with total circulation ranging from 7,000,000 to 10,000,000. *New York Woman* became *Newsweek*, *Delineator* merged with *Pictorial Review* and *Literary Digest* disappeared.

In 1938, *Ken* was the only newcomer, *Scribners* adopted pictures and *Harper's Bazaar* took up photos in place of its famous line drawings. Pulp magazines declined in the face of the photo magazines, local wars on sex copy and increase of detective serials in general magazines; but they improved in literary quality. Digest magazines declined in general but prospered in special fields. Mimeographed leftist and amateur photo magazines had a brief rage.

In 1939, *Ken* and *Scribners* died; *American Mercury*, *Saturday Review of Literature* and *North American Review* changed hands. Comic-strip books, formerly for children, now for adults, came in. Movie magazines declined. Pulp magazines came back with pseudo-science. Trade journals were very prosperous. More serious nonfiction and many war articles were seen in all magazines. The total number went up to 6,432, including 3,466 monthly and 1,399 weekly.

All circulations went up in 1940, with *Time*, *Life*, *News-*

week, *United States Weekly* leading. The war was emphasized in *Life*, *Look* and *Liberty*. While *Cosmopolitan* and *McCall's* stressed friendly fiction and pleasant home news, *Collier's*, *Saturday Evening Post* and *Ladies' Home Journal* liked signed human interest articles on the war. *Fortune* began its public opinion surveys. More risqué stories and light fiction in the pulps provided escape from war. *Reader's Digest* passed 4,000,000 and started a South American edition. The total number of magazines increased slightly, with monthlies up and weeklies down.

In 1941, advertising fell off seriously. Most picture magazines declined, except *Life* and *Look*. The old-time *American Boy* (plus *Youth's Companion*) was revived. War articles, written by roving correspondents and sent by cable or radio, filled general magazines. *Time* began aeroplane editions in Spanish. Trade papers were very strong. Leading circulations were: *Saturday Evening Post* 3,300,000; *Life* 3,200,000; *Collier's* 2,900,000; *Liberty* 2,300,000; *American* 2,200,000; *Cosmopolitan* 1,800,000.

In 1942, advertising declined further, all magazines showed smaller size, and paper had become a real problem under rationing. More war articles by dare-devil correspondents rivalled the newspaper war reporting. *Saturday Evening Post* changed its cover and format. Some 500 magazines appeared with U.S. flags on their covers in July. Father Charles E. Coughlin's *Social Justice* was barred from the mails, and *Scribner's Commentator* got into an ugly scandal over subversive material, involving *North American Review*, *Living Age* and *Current History*.

In 1943, with magazine paper consumption reduced 25%, all magazines were smaller and many appeared on much lighter papers. Not only did advertising decline, but *Life*, *Fortune* and others refused much advertising. Circulations were still high. Much war material filled the general magazines, and all carried much free advertising for war bonds. *Esquire* was in trouble with the post office over its Varga nudes and lost its second class mail privilege.

The year 1944 saw more thin paper, reduced advertising and more newspaperlike war correspondents' articles in all leading magazines. Some 1,212 magazines published free war bond advertisements. Lightweight overseas editions were printed by 27 magazines.

Some newcomers appeared in 1945. *Holiday*, a travel magazine, was launched by Curtis Publishing company. *World Report*, a weekly devoted to foreign affairs, was started by David Lawrence of the *United States News*. *The Moderator* appeared in Boston, Mass., and there were rumours of a new daily newsmagazine, *AM*, in New York city. Marshall Field added *Childcraft* and *World Book Encyclopedia* to his string. *Time* announced plans to build new plants in Chicago, Ill., and Los Angeles, Calif. OWI discontinued its wartime magazines, *Voir* and *War Times* in 1945.

Great Britain and Europe.—The ten years 1937-46 increased the gap between the newspapers of Great Britain

With the liberation of Europe the underground papers of the resistance were able to publish openly. At the same time those responsible for the wartime *émigré* newspapers published in London returned to their own countries, taking, in many cases, their newspapers with them. The end of the war saw, therefore, a substantial increase in the number of newspapers published in most of the countries of western Europe compared even with the prewar totals. Most of these newspapers were comparatively small in circulation and much behind British and U.S. standards of newspaper production and news coverage. Many of them had inadequate financial resources even for the purposes they sought to fulfil. Some of them finally merged with others of like mind and similar economic difficulties. But

Front page of the first airmail edition of the London *Daily Mail* which was flown to the U.S. on microfilm in Jan. 1944

The cost of newspaper production had reached such proportions that a substantial advertising revenue was an essential of commercial success. No national daily newspaper could meet its costs—which were likely to range between £4,500,000 and £6,000,000 a year—out of revenue from sales alone. The economic basis of their industry forced British newspapers to follow one of two courses. Advertising revenue could be secured by a “quality” circulation among the comparatively wealthy, whose means made them both individually and in the aggregate attractive to the advertiser, or else by a mass circulation reaching

Portuguese newsboy in Lisbon, offering a cosmopolitan selection of reading matter in a city crowded with refugees during 1941

a sufficient number of people of small means to make their combined purchasing power worthy of attention.

The "quality" market was numerically small. It was dominated nationally by the *Times*. The only other competitor for it, the *Morning Post* had been unable to survive and had amalgamated with the *Daily Telegraph* which sought, with considerable success, to develop an intermediate market lying between the small quality circulation of the *Times* and the mass circulation of the popular national dailies by appealing particularly to the small professional classes and middle class workers. But the main possibility of expansion lay in the vast popular market, and it was here that competition became most acute. In the attempt to secure circulation and the advertising revenue that went with it, the popular newspapers developed, as extraneous aids to sales, free insurance policies for all readers and their families and free gifts to subscribers ranging from complete sets of Dickens and other popular writers to free washing machines, and suits.

It became theoretically possible—and almost so in fact—to furnish and equip one's home and dress oneself and one's family by a judicious placing of orders between competing newspapers. This circulation race, in which Lord Beaverbrook's *Daily Express* led with the Labour *Daily Herald* second, was at its height immediately before World War II. The war brought this particular form of competition to an end. In order to save newsprint, which had to be imported, all newspapers were reduced in size by government order and were then allowed a ration of newsprint fixed according to their 1939 consumption. Additionally, they were prohibited from canvassing for circulation and

from distributing to news agents on a sale and return basis, with the result that newspaper circulations were in the main frozen at their 1939 levels, although some papers, notably the *Daily Express*, succeeded, by skilful use of their newsprint allocation, in meeting to some extent the increased demand brought by the war. At the same time the starting of new papers was prohibited, although this affected periodicals more than newspapers, for the capital required for launching a new daily paper capable of competing with those existing was so substantial and the possibilities of loss were so great that no new daily papers had in fact been started for many years.

Economically, British newspapers now found themselves in an enviable position. Their costs were substantially reduced by the enforced economies in newsprint and the similarly enforced abandonment of costly extraneous aids to circulation. Moreover, instead of having to compete for advertisements they found that as a consequence of the reduced advertisement space available, advertisers competed for the privilege of buying their space. Although the absorption of commercial undertakings into war production reduced the number of commercial advertisers, a new advertiser in the shape of the government entered the field with large expenditures by many departments, such as the ministry of food. At the same time, the war brought a great increase in readership demand, and the habit of reading more than one newspaper, when procurable, spread. Newspapers thus became more profitable enterprises than at any time in their history. Editorially, reduced size

forced newspapers to abandon most of the magazine and pictorial features with which they had sought to win circulation and to concentrate on improved reporting and presentation of news. The improvement in editorial technique was considerable.

A temporary relaxation of control was permitted in the latter half of 1946, when newspapers were allowed an additional quota of newsprint to enable them to produce slightly larger newspapers. At the same time the government agreed that for a trial period newspapers should be allowed to sell freely up to the limit of readership demand, although the prohibition on canvassing and on noneditorial aids to circulation was retained. At the end of this trial period, a new assessment for the allocation of newsprint was to be made, based on the circulation figures of each paper at that time instead of in 1939, as had previously been the case. A permanent removal of controls on newsprint was not possible because of foreign exchange difficulties.

The daily newspapers benefitting most from this freeing of circulation were the *Daily Express*, which rose to a sale of more than 3,750,000 copies a day, and the *Daily Mirror*—a tabloid, which had achieved considerable popularity with the armed services during the war by a skilful combination of leftist political views and strip cartoons, and which increased its circulation by 750,000 copies, although its total sales still remained second to those of the *Daily Express*.

It was noteworthy, however, that the largest percentage increase was gained by *The Times*, although its total circulation remained small compared with those of the popular dailies. The *Daily Telegraph* and the *Manchester Guardian* also recorded significant increases.

In the Sunday field, the largest increase fell to the *News of the World*, which announced almost immediately the phenomenal circulation of nearly 7,500,000. This paper specialized in extended reporting of police court cases and in a comprehensive coverage of all sports. The second largest increase was secured by the *Sunday Pictorial*, the Sunday companion of the *Daily Mirror*.

Although in the mass circulation field there was thus no evidence of any substantial movement of readership taste towards the more serious newspapers, there were notable advances in this direction among the weekly periodicals. Serious political reviews such as the *New Statesman* and the *Spectator*, for example, achieved a circulation far in excess of anything that had seemed possible before the war.

One other tendency of considerable significance and one which aroused some public anxiety was the development of chain newspaper systems through the purchase or control of formerly independent provincial newspapers by London groups and the closing down or merging of many such papers. The main groups concerned in this tendency were the Kemsley newspapers, the Westminster press and Northcliffe newspapers. Considerable apprehension was aroused among working journalists by what many of them feared to be a trend toward monopoly, which would further restrict editorial freedom. At its annual conference in 1946 the National Union of Journalists passed a resolution asking for a royal commission to inquire into the press. This request was supported by a substantial number of Labour M.P.s., and in October the government agreed to give time for a parliamentary debate on the matter and to allow a free vote, in which the party whips would be withdrawn. During the debate, attention was called to the fact that in the preceding 25 years the number of London morning papers had been reduced from 12 to 9, the num-

ber of London evening papers from 6 to 3, the number of morning papers in the English provinces dropped from 45 to 18 and the number of provincial evening papers from 88 to 65. A motion calling attention to increasing public concern at the growth of monopolistic tendencies in the press and asking that a royal commission should be appointed to inquire into the finance, control, management and ownership of the press in order to further the free expression of opinion throughout the press and the greatest practicable accuracy in the presentation of news was carried by 270 votes to 157. The government then undertook to appoint such a royal commission without, however, binding itself in advance to take action on its recommendations. (See ADVERTISING; PHOTOGRAPHY.) (F. Ws.)

New York

One of the original 13 states of the union, popularly known as the "Empire state," New York covers an area of 49,576 sq.mi., of which 1,647 sq.mi. are water. With a population of 13,479,142 (1940) and an estimated population on July 1, 1945, of 13,946,957, it retained its place as the most populous state. The foreign-born population was 2,853,530 in 1940, and the urban population 11,165,893. The capital is Albany, with a population of 130,577. Other cities: New York (7,454,995); Buffalo (575,901); Rochester (324,975); Syracuse (205,967); Yonkers (142,598); Utica (100,518); Binghamton (78,309) and Troy (70,304).

The chief executive officers of the state at the beginning of the decade 1937-46 were: governor, Herbert H. Lehman; lieutenant governor, M. William Bray; comptroller, Morris S. Tremaine; attorney general, John J. Bennett, Jr. (all Democrats). The legislature consisted of 30 Democrats and 22 Republicans in the senate and 77 Republicans and 74 Democrats in the assembly. Among the more important laws passed during the 1937 session were those providing for: creation of a labour relations board; establishment of a state mediation board within the labour department; payment of income taxes by constitutional officials of the state; regulation or prohibition of the transportation of goods manufactured with child labour; prohibition of duress, intimidation and coercion of employees through the means of the pay roll envelope or otherwise; establishment in the labour department of a division of minimum wage for women and minors; a permissive bill for women to sit on juries; extension for another year of the moratorium on mortgage foreclosures; a "career" bill for state employees; and a \$1,000,000 revolving fund for the rehabilitation of properties against which mortgage certificates had been sold.

In addition, the following amendments were approved and became part of the state constitution: an amendment making the term of governor and lieutenant governor four years, instead of two years; an amendment making the term of assemblymen two years instead of one; an amendment permitting sheriffs to succeed themselves; and an amendment permitting a defendant in a criminal case to waive a jury trial except when the crime was punishable by death, and providing that a verdict might be rendered by five-sixths of the jurymen. An extraordinary session of the legislature was called in December for the purpose of enacting a new municipal code. In the 1937 election, 84 Republicans, 61 Democrats, 4 American Labor party mem-

342 bers and one American Labor party-Republican were elected to the assembly.

In Nov. 1938, Gov. Lehman defeated Thomas E. Dewey (Rep.) by an announced 2,383,584 votes to 2,316,078. Norman Thomas (Soc.) polled 18,052. Charles Poletti was elected lieutenant governor. Robert F. Wagner was re-elected to the U.S. senate by a majority of 447,397.

A constitutional convention devoted about four months to the task of amending the constitution. In Nov. 1938, nine amendments were submitted to the electors. An "omnibus" amendment was passed which contained 49 proposals, reaffirming the Bill of Rights, protecting users of telephone and telegraph from wire-tapping; asserting the rights of grand juries to interrogate public officials; defining the pensions and retiring allowances of civil servants as a "contractual relationship" with the large financial liability involved; confirming tax exemptions of charitable, educational and religious institutions, and transportation of children of denominational schools at public expense; and other provisions. Amendments reapportioning seats in the legislature, outlawing proportional representation and one containing judiciary provisions, were defeated. The other five, carried by wide margins, were amendments clearing up grade crossings; authorizing provision of "low-rent housing for persons of low income," and a bond issue of \$300,000,000 for this purpose; authorizing a maximum 8-hr. day and 5-day week at standard wage on public work, with collective bargaining; permitting grants and loans to private agencies for social welfare; and excluding \$315,000,000 for transit unification from the debt limit of New York city. For the cost of the convention, \$1,350,000 was appropriated of which \$200,000 was not expended.

(H. H. L.; X.)

At the election of Nov. 7, 1939, Associate Judge Irving Lehman of the court of appeals was nominated for chief judge of that court by the Democrats and was endorsed by the Republicans. He was unanimously elected. The legislature, Republican-controlled, passed for the second time an amendment to the constitution modifying the provision against gambling to permit pari-mutuel betting on horse races, and directing that the state should receive a reasonable revenue from the system. The amendment was submitted to the people on Nov. 7 and was ratified by a vote of two to one. The legislature adopted a budget of \$388,000,000 for the fiscal year of 1939-40, which was \$27,000,000 smaller than the amount recommended by the governor. It levied a tax of two cents a package on cigarettes, and the liquor tax was increased by 50 cents a gallon. An income tax on the salaries of federal employees was voted, and the appointment of a legislative auditor to assist in framing the budget was authorized. Provision was made for free bus transportation and the extension of public health and welfare service to children attending parochial and other private schools. The expenditure of not more than \$1,000,000 a year on a state housing program was voted.

Other measures adopted were a constitutional amendment extending the term of senators from two to four years; a reduction to 15% of the cost of removing grade crossings to be levied against the railroads; barring civil service and teaching positions to all persons advocating the overthrow of the government by force; placing the control of home relief in the hands of localities; extending the mortgage moratorium to July 1, 1940; making it a misdemeanour to sell merchandise not marked with the place of origin and forbidding "loss leaders" in retail

trade; eliminating primary elections where there was no contest for a nomination; and advancing \$900,000 for federal flood control projects on condition that the money be returned to the state.

In the election of Nov. 5, 1940, Roosevelt (3,251,918), with the aid of the American Labor party, won the state electoral vote. The straight Republican vote for Wendell Willkie (3,027,478), however, was 192,978 greater than the straight Democratic vote for Roosevelt. James M. Mead, Democrat, was re-elected to the U.S. senate. Three vacancies on the bench of the court of appeals were filled by the election of Edmund J. Lewis and Albert Conway, endorsed by the Republican, Democratic and American Labor parties; and C. S. Desmond, supported by the Democrats against a Republican opponent. The Republicans retained control of both houses of the legislature, making a gain of three seats in the senate and two in the assembly, giving them 30 of the 51 senators and 87 of the 150 assemblymen.

The legislature passed an act authorizing pari-mutuel betting at race tracks. A budget of \$391,600,000 and a supplementary budget of \$1,791,000 were approved. The governor ordered the attorney general to make an exhaustive inquiry into all subversive activities within the state and directed all other public officials and their subordinates to co-operate in the investigation. Scandals arising from the award of state printing contracts led the governor to appoint a commission to make an investigation. The Public Service commission began to carry out a program for 68 grade-crossing projects.

During 1941, the legislature created a division of commerce to take over the work of the state planning council and publicity bureau. To discourage circulation of scurrilous campaign documents, a law was passed forbidding political circulars not bearing the name and address of the printer or agency responsible for them. The emergency income tax of 1% was not renewed, thus saving the taxpayers \$21,000,000 a year. An appropriation of \$247,000 was voted to the committee investigating the cost of public schools and the extent of subversive activity in them. The appointment of boards to inquire into labour disputes was authorized, and the mortgage moratorium was continued for another year. Persons voluntarily leaving their jobs were barred from unemployment insurance benefits; the creation of a state defense council was authorized; an appropriation of \$600,000 for vocational education was voted; and several bills barring radicals from subversive activities were killed. The voters approved an amendment permitting the use for highway improvement of the proceeds of an issue of \$60,000,000 in bonds originally authorized for the elimination of grade crossings.

The legislature at its 1942 session created a state war council with broad powers, authorized the waiving of the 40-hr. week on public work and the maximum number of hours a day for employment on private work, permitted the use of prison labour for war production, reduced the state income tax by 25% for 1942 and 1943, and passed a congressional reapportionment act continuing the practice of electing 43 of the 45 representatives by districts and two at large. It also authorized the construction of a super-highway.

As the state was to elect a governor in 1942, President Roosevelt sought to induce the Democrats to nominate U.S. Senator Mead, but James A. Farley succeeded in bringing about the nomination of John J. Bennett, Jr. The Republican candidate, Thomas E. Dewey, was elected by a plurality of more than 500,000 votes, the first Republican to be elected to the office in 20 years. The Republi-

Manhattan's Stage Door Canteen, a noted recreation spot for Allied servicemen and women during World War II

cans also elected the lieutenant governor and state comptroller, while the Democrats elected the attorney general. Three supreme court judges were re-elected in the first district and five judges were elected in the second district. President Roosevelt appointed Governor Lehman as director of foreign relief and rehabilitation. The governor resigned on Dec. 3 to take up his new duties and was succeeded by Charles Poletti, the lieutenant governor, who served until Jan. 1, 1943.

In 1943, the legislature changed the date of the opening of the fiscal year from July 1 to April 1, raised the pay of state employees 7½% and 10%, appropriated \$25,000 for child-care centres under the state council for children whose mothers were engaged in war work, continued the Commission on Postwar Planning, put disabled veterans of World War II on the same basis as veterans of World War I, permitted the continuance of free lunches in schools, removed the stigma of conviction of crime in the case of deserving youth between the ages of 16 and 19, created an Emergency Food commission, and reapportioned the legislative districts. An election was held to fill the vacancy caused by the death of the incumbent lieutenant governor. The Republicans nominated state Senator Joseph R. Hanley, and the Democratic candidate was Lt. Gen. William N. Haskell, who was also supported by the American Labor party. Hanley was elected by a majority of about 350,000 votes. (G. W. Do.; X.)

The legislature concluded one of the shortest sessions in the state's history on March 18, 1944. Practically all of Gov. Dewey's program was enacted, including the setting aside

of a \$148,000,000 state surplus as a postwar reconstruction fund; creation of a commission to co-ordinate services for returning veterans; continuation of the 25% reduction in the state personal income tax; extension of maximum unemployment insurance benefits to all state war veterans; broadening of the state's postwar public works program; full state aid for education; creation of a state department of commerce; creation of a commission to investigate racial discrimination; reform of the administration of the Workmen's Compensation law; provision for a full soldier ballot; continuation of the Emergency Food commission; and revision of the laws of succession to the office of governor.

Appropriations from the general fund at the 1944 session of the legislature totalled \$367,775,845.15, and additional appropriations totalling \$7,739,312 were also made for the first time from the Postwar Reconstruction fund. The Republicans continued control of the state administration and both houses of the legislature. The presidential vote in the state was as follows: Dewey and Bricker (Rep.), 2,987,647; Roosevelt-Truman 3,304,238 (Dem. 2,478,598; American Labor party 496,405; Liberal party 329,235); Teichert and Galbaugh (Industrial Government) 14,352 and Thomas and Hoopes (Soc.) 10,553.

Gov. Dewey created a reconversion service agency in 1945, to clear the tracks for business conversion from war production and to assist industry to full employment of the state's labour resources. The commissioners of commerce, public works and labour were appointed by the governor, and part of the staff of the state war council was transferred to the department of commerce to help carry out the purposes of the agency. A division of veterans'

affairs in the executive department was created by the legislature with an appropriation of \$2,825,000. Aid to veterans included advice on re-employment, education, welfare, job training and business opportunities. The governor negotiated the transfer of army and navy housing for conversion into homes for veterans and their families.

The legislature also extended insurance benefits for unemployed workers up to \$21 a week for a maximum of 26 weeks, and enacted unemployment insurance experience rating for employers making a successful effort to main-

tain stable pay rolls. This resulted in tax credits to qualified employers totaling \$76,500,000. The administration of workmen's compensation was improved and coverage extended. The Ives-Quinn Anti-Discrimination bill was passed, as were bills creating a youth commission designed to combat juvenile delinquency; giving municipalities the right to acquire property for rehabilitation; providing for additional loans for public housing; and raising the limit on state subsidies for housing.

Both in 1945 and 1944, large surpluses of \$163,000,000 and \$156,000,000 were transferred on recommendation of the governor to the Postwar Reconstruction fund. Altogether, about \$800,000,000 in public works construction was planned for the reconversion period. Appropriations from the general fund at the end of 1945 totalled \$370,000,000 and, at the same time, the personal income tax was reduced by one-fourth for the second year. State financial aid to municipalities was increased. More than \$100,000,000 was distributed to localities as their share of the personal income, franchise, utilities, motor vehicle, motor fuel and alcoholic beverage taxes. In addition, the state paid out almost \$150,000,000 to localities for support of common schools, relief and welfare and other state aid. Altogether 42% of state tax revenues was returned to localities in aid or shared taxes.

Results of the 1946 state elections, in which an all-time record of more than 5,000,000 votes were cast, represented a landslide victory for the Republican party. Gov. Thomas E. Dewey, running against coalition candidate James M. Mead, was re-elected by the largest majority in New York gubernatorial history. All of his running mates were successful, including Lt. Gov. Joseph R. Hanley and Atty. Gen. Nathaniel L. Goldstein. The party gained 6 seats in the house of representatives, as well as 16 seats in the state assembly and 6 in the state senate, giving Republicans control of the state legislature. The Liberal party acquired legal status by registering more than the required number

New York City

Apparently reliable though unofficial estimates at the end of 1946 placed the population of New York city, the largest in the United States, at only a little less than 8,000,000; the federal census of 1940 showed a population of 7,454,995.

The decade ending with 1946 was distinguished primarily in New York city by the intensification of problems arising in a growing city of intense concentration of population. Some of these problems appeared to be less serious than others, but students of the metropolis and its life agreed that their nature had remained more or less constant—the subways, municipally owned and operated, continued to lose money on the five-cent fare, and the deficit had to be met by revenue from other sources; the heavy street traffic, consisting of automobiles, taxicabs, buses and motor trucks, caused a steadily increasing congestion for which no over-all remedy was found; the housing shortage and the absence of adequate hotel accommodations made living conditions for tens of thousands of persons precarious in the extreme; a constant succession of strikes, and threats of strikes, involving workers of many types, caused much apprehension, uncertainty and sometimes discomfort; the support of various municipal services, such as schools and hospitals, presented increased difficulties and crime and juvenile delinquency, particularly during and after World War II, showed a serious increase. Many types of business, notably the great garment industry, began with greater or less speed to move to cities with lower tax rates, better living conditions and cheaper labour. For the last fiscal year of the decade the tax rate was \$2.66 for every \$100 of assessed valuation, making possible a budget of more than \$750,000,000.

Unquestionably the most notable New Yorker, both in reputation and accomplishment was Fiorello H. La Guardia, the short, pudgy, impulsive sometime radical, who was mayor of New York city for three terms (12 years), from Jan. 1, 1934, to Jan. 1, 1946, when he was succeeded by a Democrat, William O'Dwyer, a native of Ireland who had been a labourer, policeman, magistrate, prosecutor and army officer.

It was largely La Guardia, with his vigorous personality and his many ideas, which gave New York city its peculiar tone and colour during the eventful decade. He hated Tammany Hall, the old Democratic organization of New York county, and his success at the polls, together with an accumulation of scandals, gravely diminished the power of Tammany. La Guardia professed warm friendship for union labour; he fought against racial discrimination of all sorts; he insisted upon an efficient and honest police force, and the results obtained under his police commissioner, Lewis J. Valentine, were generally praised; he was outspoken in his attacks upon "political fixers" and "tinhorn gamblers"; he did not hesitate to attack powerful newspaper publishers when he thought them wrong and he was credited, in spite of the many handicaps under which he was forced to work, with giving the city an admirable administration and with building many public works. In the fall of 1945 he said, with characteristic confidence, that if he chose to run for a fourth term he

could be elected if he ran on a "laundry ticket"; instead, he formed a new city party, the so-called "No-Deal" party, which favoured the election of Newbold Morris. Opposed to Morris were Jonah J. Goldstein, who had the backing of the Republicans, the Liberal party and the City Fusion party; and O'Dwyer, the Democrat, who had become a brigadier general in the U.S. army during World War II and was widely known for his success while district attorney of Kings county (Brooklyn) in breaking up a notorious organization of thugs and racketeers popularly known as Murder, Inc. With the opponents of the Democrats divided, the election of O'Dwyer was assured.

When Mayor O'Dwyer took office at the beginning of 1946, he kept many of the La Guardia appointees, notably the park commissioner, Robert Moses, and Arthur Wallender, who had been made police commissioner in the last months of the La Guardia regime. Notwithstanding the generally successful reputation of the La Guardia administration, Mayor O'Dwyer came into office facing problems of the most pressing nature—in particular, such problems as the obsolescent subway system, the necessity for replacing or improving much of the city's plant and the demands of many city employees for more pay. In addition, he had to deal with a series of strikes—subway workers, the marine union, truck drivers and so on—which at times threatened the food and fuel supply of the city's residents.

Of particular interest to politicians was an attempt by Mayor O'Dwyer, as titular head of the Democratic party in his city, to "reform" Tammany Hall. It was agreed that some time would be necessary to obtain such reform, and by the end of 1946 the mayor had not yet succeeded in placing his own candidate, Frank J. Sampson, at the head of Tammany.

From time to time during the decade, various city planners, as well as outside observers of urban life, contended that New York city, as a place in which to live and do business, had about reached the saturation point. This school of thought, which argued that New York had virtually reached the end of its industrial development, and that in fact it might be at the beginning of a serious decline, was opposed by another school of thought, which held that New York city, by its very nature, would for

Merchandise littering the streets of Harlem, New York city, after the Negro riot of Aug. 1-2, 1943

many years remain the centre of the management genius of the United States, that it would become more and more a national cultural centre and that its position as the nation's playground and show-window—with its many theatres, night clubs and other amusements—would remain unimpaired for decades.

Among the exciting and much debated events was the holding of the New York world's fair on a large site which had been built up on the Flushing meadows in Queens county. This fair, which was held in 1939 and then held over for another year, attracted much attention nationally and even internationally, and was generally regarded as an artistic success, though the backers only got back about 40 cents for each dollar they invested. (See FAIRS, EXHIBITIONS, EXPOSITIONS.)

The end of the decade found New York city still in an uncertain position so far as its part in the air age was concerned. Under the leadership of Mayor La Guardia, a large airport, named for the mayor, was built on Flushing bay, mostly of made land. After only three or four years' use it became apparent that it was too small; moreover, the land was sinking, and it was not clear whether repairs would be worth the cost. Meanwhile, during the last two years of his administration, Mayor La Guardia launched a vast project for an airfield to be known as Idlewild, farther out on Long Island. One of Mayor O'Dwyer's first acts when he assumed office was to lop off \$45,000,000 from the planned expenditure for this field; however, work on the field went ahead.

In the closing days of 1946 John D. Rockefeller, Jr., caused world-wide interest by announcing that he was giving a large tract of land on Manhattan Island, just above 42nd street on the East river, as a site for the building of the capital of the United Nations. (See also MUNICIPAL GOVERNMENT.)

New Zealand, Dominion of

New Zealand is a self-governing dominion of the British commonwealth with a legislature consisting of a governor-general representing the king, an elected house of representatives and a nominated legislative council. It consists of two large and several small islands in the south Pacific some 1,200 mi. east of Australia. The area of the dominion proper is 103,416 sq.mi. (North Island 44,281 sq.mi., South Island 58,092 sq.mi., Stewart Island 670 sq.mi., Chatham Islands 372 sq.mi.). The Cook Islands and other outlying islands annexed to New Zealand have an area of 519 sq.mi. New Zealand also administers the Tokelau Islands and the Ross dependency, administers Western Samoa under a mandate and shares the mandate for Nauru.

The capital is Wellington (by the 1945 census, 173,420 inhabitants). Other chief towns are Auckland (263,370), Christchurch (150,047) and Dunedin (83,351). A census was taken in 1936 and again in 1945. At the end of March 1936 the population was 1,573,927; in Sept. 1945 1,702,298. The Maori population is included in the above

figures—in 1945 it was 98,744; since it had been 82,326 in 1936, its increase was more rapid than that of the white population. Practically the entire increase in the dominion's population was represented by the increase in the North Island, which in 1946 accounted for 67.3% of the total dominion population as compared with 64.7% in 1936. The drift to the towns was also marked—in 1936, 59.54% of the population lived in cities and boroughs; in 1945, the figure was 63.12%. The strongest religious denominations as recorded in the 1936 census were Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012. Governors-general: Viscount George Galway (April 12, 1935–Feb. 3, 1941), Air Marshal Sir Cyril Newall (Feb. 22, 1941–April 19, 1946), Lt. Gen. Sir Bernard Freyberg (after June 17, 1946). Prime ministers: M. J. Savage (Dec. 6, 1935–March 27, 1940); Peter Fraser (after April 1, 1940).

New Zealand's history during the decade 1937–46 may be best discussed in four sections—the first concerned with the development of the Labour government's policy; the second with New Zealand's part in World War II; the third with trends in New Zealand's economy, resulting partly from the government's policy, partly from the war, and partly from a continuation of long-term tendencies; the fourth with the development of New Zealand's external relations.

Labour Government's Policy.—The Labour government, first in the country's history, came into office in Nov. 1935 after New Zealand had suffered a severe economic depression. The basis of the policy on which it was elected and which it later put into operation was the restoration of prosperity, the establishment of new and higher living standards for the people and the organization of New Zealand's economy so as to protect it against another depression. Much of the legislation needed to give effect to this policy was passed during the 1936 session. In that year cuts in salaries and wages made during the depression were restored, and pensions were resumed and increased. The jurisdiction of the arbitration court over industrial disputes was restored—compulsory arbitration had been in force since 1894, but had been abolished during the depression. The principle of a 40-hour, 5-day week for industry wherever possible was established, and compulsory unionism was introduced. Minimum wages and conditions were laid down for dairy farm workers who had previously suffered through lack of legal protection. A Primary Products Marketing act protected the farmers against world price fluctuations by providing that the government should take over at a guaranteed price all dairy produce for export. The guaranteed price fixed in 1938 for butterfat was 15.88d. per lb. for butter and 17.88d. for cheese. (During the war years the basic guaranteed price was increased and supplemented by special cost allowances so that in 1946 it stood at 20.394d. for butter and 22.394d. for cheese.) In 1939 an internal marketing division of the marketing department was set up to organize the domestic marketing of dairy produce and other foodstuffs. Its activities expanded rapidly, particularly during the war years, and at the end of the decade it exercised control over butter, eggs, honey, potatoes, bobby calves, imported and locally grown fruits, hops, maize, barley and certain farm manures.

A central reserve bank set up in 1934 was placed under full government control in 1936. Since the bank was empowered to make such advances to the government as might be necessary, this measure enabled the government to ensure that men and materials did not remain idle

Rockefeller Center, after its completion in 1940, became a pivotal centre of the New York business and entertainment world

through a shortage of the money necessary to bring them into useful employment. This power was used with restraint. In the prewar period reserve bank advances and investments totalled £23,500,000, mainly for housing purposes; in the war period the total increased by £11,400,000 for all purposes. In Dec. 1938, as a result of the depletion of New Zealand's sterling balances in London, the government introduced measures of import and exchange control. The import of certain types of goods was drastically reduced in this way, and others were totally prohibited.

With New Zealand's economy stimulated and protected by the measures described above, the government was able to embark upon an unprecedented expansion of social services. The most important item in this program was given effect in the Social Security act, 1938, which provided for the replacement of the old noncontributory pensions by social security benefits, for the creation of new types of benefits and for medical and other health benefits. These sums were paid into the social security fund and supplemented, if necessary, from the consolidated fund. Social security benefits were paid to old people, to widows, orphans, invalids and others who could not secure employment. For instance, a man over 60 would receive £104 a year for himself plus £52 for his wife (unless she was over 60 and eligible for the full £104) and £26 for each child under 16. In this and the other benefits mentioned above there were limits on the other income which could be received by beneficiaries, but with the universal superannuation benefit and the family benefit there was no such limit. The superannuation benefit, which started at a rate of £10 a year in 1940 and was to increase by £2.10s. a year until it reached a maximum of £104 in 1978, was payable

to everyone at the age of 65. It would eventually replace the age benefit. Before 1945 there was an income limit for recipients of the family benefit, but this was removed to make a universal family benefit of £26 a year for every child under 16.

The social security health benefits were brought into force at intervals beginning in 1939. Owing to the opposition of the doctors it was not possible to introduce the medical benefits scheme as originally planned, and in 1946 there were two alternative schemes in force, under the most general of which 7s.6d. of the doctor's fee was paid by the state. Except for specialists, doctors either accepted the 7s.6d. as full payment or charged 3s. extra. Medicines—except proprietary medicines—were supplied free under social security when prescribed by a doctor. Expenditure on social security for 1945-46 was £22,960,000. Corresponding pensions in 1936-37 amounted to £4,900,000.

State housing was another new feature of Labour policy. New Zealand, like other nations, was suffering from a housing shortage for many years, and in 1937 a special housing construction branch of the State Advances corporation was set up. Finance was made available for this work at 1% for the first £5,000,000 and at 1½% for subsequent sums. By 1946, loans for housing under the scheme totalled more than £31,000,000; more than 21,000 state houses were built. In 1945, a record number of 9,000 state houses were completed. These were let at very moderate rentals—for instance, the rent of a four-room state house varied from 24s. to 26s.9d. a week. Rents of houses let by private individuals had been controlled since 1936.

At the same time, existing social services were extended. For instance, expenditure on education, which was £4,032,266 for 1936-37, rose to £7,979,605 for 1945-46. In 1944 the school leaving age was raised to 15 years. The government gave special attention to the welfare of the Maori people, who shared equally with the rest of the population in the benefits of the social security scheme. Maori land development and housing schemes were pushed ahead energetically in the period. Even during the war years it was possible to continue this program of social reform. In particular, notable advances were made in labour legislation. In 1944 the Annual Holidays act was passed, providing for an annual holiday of two weeks on full pay for all workers, permanently or casually employed, who were not otherwise provided for. In 1945 the Minimum Wage act established minimum wage rates of £5 5s.0d. a week for men and £3 3s.0d. for women and an amendment to the Shops and Offices act brought the 40-hour 5-day week to shop assistants and clerical workers.

Two other important measures of government policy were put into effect in 1945. The Electoral Amendment act abolished the country quota, which for 60 years had given country areas more representation in proportion to population than town areas. The Bank of New Zealand act made complete the state's partial ownership of that bank.

At the elections held in Oct. 1938 Labour gained for the first time an absolute majority of the votes cast. But since the conservative Democratic party which had contested the 1935 elections had now disappeared, this did not mean an increase in the seats held by Labour in the house of representatives. In fact, Labour seats fell from 55 to 53, Nationalists increased from 19 to 25, and Independent fell from 6 to 2. In March 1940 J. A. Lee, who had been undersecretary to the minister of finance, was expelled from the Labour party for attacks which he had published against the then prime minister, M. J. Savage. He formed a Democratic Labour party in which he was joined for a while by W. E. Barnard, speaker of the house, who later unsuccessfully contested his seat as an Independent. As a result of the war the elections which normally would have been held in 1941 were not held until Sept. 1943. At these elections the left-wing vote was split by the Democratic Labour party as the right-wing vote had been split by the Democratic party in 1935. Labour seats fell to 45, Nationalist seats rose to 34, the single Democratic Labour seat disappeared, and only one Independent seat remained. At the election on Nov. 27, 1946, Labour dropped to 43 seats while the National party advanced to 37.

New Zealand and World War II.—Immediately after the New Zealand government had received news that Great Britain was at war with Germany it issued a declaration of war as from 9:30 P.M. Sept. 3, 1939. In the six years that followed New Zealand sent its forces overseas to fight the axis powers by land, sea and air; in 1942 it faced the threat of invasion of its own shores by the Japanese, and mobilized its productive strength to make the greatest possible contribution to the common cause.

On July 17, 1940, the government delegated control of all matters connected with the war effort to a war cabinet of three government and two opposition representatives. A war council set up in the previous month comprising representatives of various branches of industry continued to act in an advisory capacity until Aug. 1942. In June 1942 a wider participation of the opposition in the war effort was secured for a while by the establishment of a war administration of eight Labour and six opposition

ministers and by the enlargement of the war cabinet to include the leader of the opposition, S. G. Holland. This arrangement ended in October of the same year when Holland and three of his colleagues resigned in protest at the government's handling of a strike in the Waikato coal fields. Thereafter the war effort was controlled by the war cabinet consisting of Peter Fraser, Walter Nash (minister of finance), D. G. Sullivan (minister of industries and commerce), F. Jones (minister of defense), J. G. Coates (died May 27, 1943), A. Hamilton and Sir William Perry (from June 1943).

Compulsory military service for men between 18 and 45 was introduced in June 1940. By the end of 1941 the transfer of manpower from industry to the armed forces had reached a point where important industries were finding it very difficult to secure labour to maintain production. The entry of Japan into the war and the consequent mobilization of the home defense forces aggravated the situation, and measures of industrial manpower control became essential. These were introduced from Jan. 1942 onward. Certain industries were declared essential; in these, employment could not be terminated by worker or employer without the consent of the district manpower officer. Men in the age span of 18 to 59 years, and women in the age span 18 to 40 years, were made subject to direction to essential work. These measures of manpower control were lifted after the war.

The first echelon of a New Zealand division sailed for Egypt in Jan. 1940. In April 1941 the division fought against overwhelming odds in Greece, and a month later in Crete. In November of the same year it took part in the second Libyan offensive and in particularly bitter fighting at Sidi Rezegh. After this it was transferred to Syria to rest, but in June 1942 the New Zealanders were rushed again to the western desert where Marshal Erwin Rommel was menacing the entire British position. After

Anzac day ceremonies in 1942. Patrick J. Hurley, U.S. minister to New Zealand, laying a wreath at the base of a cenotaph in Auckland

playing what Winston Churchill declared was "a magnificent, a notable and even decisive" part in stemming the German advance, they formed part of the spearhead that broke through the German line at El Alamein in November. In the next six months they fought a series of actions in Libya and Tunisia against the retreating axis forces until on May 13, 1943, axis resistance in North Africa came to an end.

In Oct. 1943 the division was moved to Italy. After fighting in the Sangro offensive in November it was moved to the west coast to take part in the Rapido offensive and the long, grim battle for Cassino. Later in 1944 it fought at Sora, Arezzo Florence and Faenza. In April 1945, in the offensive that was to end the war in Italy, the New Zealand division crossed a number of formidable river barriers to link up with Yugoslav forces at Monfalcone and enter Trieste. The division was under the command of Lt. Gen. Sir Bernard Freyberg, who later became governor general of the dominion.

From early in the war New Zealand troops had garrisoned certain Pacific islands, and at the beginning of 1942 New Zealand forces in Fiji were increased to divisional strength and transferred to New Caledonia. Between Sept. 1943 and Feb. 1944 this division cleared the Japanese from Vella Lavella, Mono and Nissan islands in the Solomons area. After the defeat of Japan a New Zealand contingent went to form part of the British commonwealth occupation force in that country.

During the war 48,000 New Zealanders joined the air force, and 30,000 of them served overseas. Seven New Zealand squadrons, flying fighters, heavy and medium bombers, torpedo bombers and flying boats served in Britain and elsewhere. New Zealand airmen, in fact, served in every theatre where the royal air force operated. Royal New Zealand air force squadrons also co-operated with United States forces in the war against the Japanese. New Zealand's pre-entry training scheme to fit civilians for air force duties was the first of its kind and was followed in other parts of the British commonwealth.

The New Zealand cruiser "Achilles" gained fame early in the war at the River Plate engagement which led to the sinking of the "Graf von Spee." In Feb. 1941 another New Zealand cruiser "Leander," sank the Italian raider "Ramb 1" in the Indian ocean. Both these cruisers as well as smaller New Zealand war vessels later served against the Japanese in the Pacific. As was inevitable from New Zealand's geographic situation, the part played by men of the merchant navy in the war effort was vitally important, exacting and often dangerous.

New Zealand's home defenses were augmented by a part-time home guard and an emergency precautions service. Service in each was made compulsory after Japan came into the war, and the home guard attained a peak strength of 124,000 and the E.P.S. 150,000. When it seemed that New Zealand might be invaded, a substantial home defense force had to be built up in addition to the forces that were being maintained overseas. U.S. forces arrived in New Zealand from early 1942 onward to assist in its defense and prepare for offensive operations against the Japanese.

Women's auxiliary services served with the army, navy and air forces. The women's auxiliary air force was the first to be established in Jan. 1941, and the women's auxiliary army corps was the largest, with a peak strength of 4,600. Many "Waacs" served in the middle east and Pacific; others were posted to coastal batteries and anti-aircraft stations in New Zealand. Still other women did splendid work in the army nursing service. The war work of women's organizations in New Zealand was co-ordinated through the women's war service auxiliary, which attained a membership of 75,000.

Although the Maori people were exempted from the operation of conscription, they gave full support to the common effort. The Maori battalion which served with the division in the middle east never lacked volunteers, and a second Maori battalion was formed in New Zealand when the Japanese threat developed. In 1942 the govern-

Agricultural production in New Zealand reached peak levels during World War II, when intense efforts were made to contribute toward food requirements of Allied armies in the Southwest Pacific. Farmers in New Zealand are shown stacking hay

ment set up a Maori war effort organization under P. K. Paikea to direct the organization of Maori manpower for the forces and industry.

In all, 135,000 New Zealand men and women served overseas during the war. The armed forces attained a peak strength of 157,000 in Sept. 1942, when there were 127,000 in the army, 6,000 in the navy, and 24,000 in the air force. Of these numbers 43,000 were overseas and 114,000 mobilized in New Zealand. Casualties suffered were 10,100 New Zealand servicemen killed in the war, 19,300 wounded, and at one time 8,100 were prisoners in axis hands. Of the 6,522 decorations won, eight were Victoria crosses, one with bar.

In production, too, New Zealand's wartime achievements were considerable. Here, of course, the main effort was in providing primary produce for Britain, whose need of it became more acute after the German occupation of western Europe cut off supplies nearer at hand. Great difficulties had to be overcome to maintain and increase production—shortages of manpower and fertilizers, bad seasons in 1942-43 and 1943-44 and switches from butter to cheese production and back again at the request of the United Kingdom.

During the war 1,980,000 short tons of meat, 753,500 tons of butter and 687,500 tons of cheese were sent to Britain. Rationing of meat and butter, introduced to make the largest possible quantities available, still continued at the end of the decade. When U.S. forces arrived in the Pacific, New Zealand became a supply base for them also. Nearly £40,000,000 of food was supplied to the United States during the war, including 209,000 short tons of meat, 25,300 tons of butter and 150,700 tons of vegetables. The provision of the vegetables entailed an especially remarkable effort in which new ground was brought under vegetable production, canning plants were expanded and new dehydration plants established.

New Zealand's productive effort was not confined to farming. Through the willingness of workers to work longer hours and through the efforts of new recruits to industry, notably women, factory production rose steadily despite the manpower shortage. Some activities which were carried on previously on a very minor scale developed during the war to the status of substantial industries. Among these was shipbuilding; more than 500 ships, including mine sweepers, submarine chasers, tugs and barges, were built in New Zealand during the war. This industrial expansion was made possible by the increase in New Zealand's coal production, which stood at a record figure in 1939, but increased every year after then.

By 1946, more than 150,000 servicemen had already benefited under New Zealand's rehabilitation scheme. Loans were provided for men who wished to build homes, set up in business or buy farms. Former servicemen had been saved from buying land at inflated prices by the Land Sales act of 1943, which pegged land values at the level ruling in Dec. 1942. Training in farming and vocational training in skilled trades were given to former servicemen who desired them. Rehabilitation bursaries enabled others to study full time at universities, some of them on postgraduate bursaries overseas.

Up to Dec. 1945 New Zealand's total war expenditure was £574,000,000. Of that sum £246,000,000 was obtained from taxation, £233,000,000 from loans and £95,000,000 from lend-lease. All the money borrowed for war purposes from Great Britain under the memorandum of security agreement, amounting to some £60,834,000, was repaid.

Economic Trends.—New Zealand's overseas trade became the highest, per capita, in the world and nothing

was of more importance to its economy. The development of manufacturing was also important. This was a result partly of general prosperity, partly of government encouragement, direct and through import control, and partly of the needs of the war. Between 1937 and 1943 the number of persons engaged in factory production increased from 96,401 to 114,590, despite the mobilization of many workers for the forces.

Particularly striking was the increase in electric power generated, from 1,141,958,000 units for 1936-37 to 2,273,839,000 units in 1944-45. Even this increase was not able to keep pace with the increased demand of private and industrial consumers, and in the winters of 1945 and 1946 New Zealand suffered from a shortage of electric power.

These production advances were accompanied by an increase in the national income. Aggregate private income, which was £157,500,000 for the year ended March 31, 1937, rose to £292,300,000 for the year ended March 31, 1944. These figures include salaries and wages which more than doubled, rising from £85,900,000 to £176,500,000. The trend was, of course, in large part a healthy one, reflecting the rise in production and the liberation of the national economy from a deflationary condition.

But New Zealand, like all other belligerent countries, had to face the situation during World War II by which incomes continued to rise while the volume of goods available for civilian consumption was drastically reduced. In this lay the threat of inflation. Price control, which had been in operation since the start of war, was merged in a general economic stabilization scheme to hold prices, costs and wages in Dec. 1942. This scheme operated so successfully that the cost of living during the years 1939-45 rose by only about 14%.

External Relations.—In 1937 New Zealand was represented abroad only by its high commissioner in London and by departmental officers such as trade and tourist commissioners in various countries. In 1938 the British government appointed a high commissioner in New Zealand through whom, and not through the governor general, the New Zealand government communicated with the British government. Through W. J. Jordan, its representative at the League of Nations assembly at Geneva, it made clear its adherence to collective security and opposition to appeasement in the years before World War II. The close co-operation that was necessary between New Zealand and the other United Nations during the war led to the expansion of its representation in the countries of the British commonwealth and to the establishment of diplomatic posts in foreign countries. From 1942 New Zealand and the United States were represented by ministers in each other's countries; in 1944 New Zealand sent a minister to the U.S.S.R. and from 1945 both the U.S.S.R. and France were represented by ministers in New Zealand. In 1942 New Zealand sent a high commissioner to Canada and in 1943 to Australia. In June 1943 a department of external affairs was set up with Peter Fraser as the first minister of external affairs. Previously, external relations had been the function of the prime minister's department. The external affairs department as it then existed had been concerned solely with the administration of New Zealand's island territories.

The Canberra pact between New Zealand and Australia in Jan. 1944 provided for consultation and co-operation between the two countries, particularly on matters concerning the South Pacific area. The New Zealand government, however, recognized that peace could not be

safeguarded on a purely regional basis and was wholehearted in its adherence to the ideals of the United Nations. In 1945 its viewpoint on international security was put forward by Peter Fraser at the San Francisco conference and at the first meeting of the general assembly of the United Nations in London in early 1946, and at the Paris peace conference by H. G. R. Mason and W. J. Jordan.

Nicaragua

Largest of the Central American republics, Nicaragua is situated between Honduras on the north and Costa Rica on the south. Area, 57,144 sq.mi., of which 3,475 sq.mi. is water. Pop. (1944 est.), 1,048,642; the population by the 1940 census was 983,160; later official estimates were as follows: 1941, 1,013,946; 1942, 1,030,700; 1943, 1,043,603. Racial distribution of the population was estimated at 68% mestizo, 17% white, 10% Negro and 5% Indian; Negroes remained in the majority in a few communities along the Mosquito coast. The population density, as officially estimated in 1942, was 18.04 per sq.mi., varying from 2.57 in the department of Zelaya to 318.19 in the department of Masaya; three other departments had population densities exceeding 100 per sq.mi. The capital is Managua (1941 official pop. est., 87,620); other urban centres are León (31,799); Granada (25,530); Masaya (21,070); Chinandega (15,377) and Bluefields (10,099).

The constitution of March 22, 1939, established a unitary government with 15 territorial departments, a president chosen by direct, popular election for a six-year term, a bicameral legislative body including a senate of 15 members elected for six years (plus all elected ex-presidents, serving for life) and a chamber of deputies (of 40 members) chosen on a population basis. Presidents during the decade 1937-46 were Carlos Brenes Jarquín, provisional president from June 1936 to Jan. 6, 1937; Anastasio Somoza, after the latter date.

(R. H. FN.)

Somoza's Leadership.—Nicaragua had entered a period of relative tranquillity after the resignation of President Juan B. Sacasa in June 1936. The National Liberal and National Conservative parties united to nominate a single candidate for the presidency of the republic, General Anastasio Somoza. Somoza was elected by an immense majority in December and took office in Jan. 1937, forming a government of national union. Carlos Brenes Jarquín had acted as provisional president in the interim.

In Aug. 1937 a controversy arose with the neighbouring republic of Honduras as a result of the two nations' long-standing border disputes. Two airmail postal stamps, one of which included and the other excluded the disputed territory, gave rise to the conflict, which seemingly could only be solved by force of arms. The friendly services of the United States induced the countries to accept mediation, which was carried out by means of conferences in San José, Costa Rica. The tribunal of mediation was composed of the foreign minister of Costa Rica, a delegate from the United States and another from Venezuela. Each delegation, presided over by the foreign ministers of Nicaragua and Honduras respectively, presented its case and discussed the matter before the tribunal of mediation, which was suspended after some time for an indefinite period.

In Aug. 1938 the national congress of the republic ratified a decree of 1936 relating to complete reform of the constitution and the constitutional laws. By this decree, the people were called upon to elect representatives to a constituent assembly, regulations were made to apply the principle of minority representation, and a technical commission of seven jurists (four members of the majority party and three of the minority) was created to prepare a preliminary draft of the projected new constitution.

The election of 55 representatives took place on Sunday, Nov. 6, 1938; the national constituent assembly was installed the following Dec. 15, and the new constitution promulgated on March 22, 1939. The constitution was eminently democratic; it included standards implying a complete renewal of national institutions, with the principle of minority representation; it stated the modern concept of property as a social function, and the postulates of social justice respecting the fundamental rights of the people.

The national constituent assembly, acting in full sovereignty, elected Somoza president of the republic for a term lasting from March 30, 1939, until May 1, 1947. The assembly also converted itself into a legislative assembly composed of two chambers: the senate, composed of 15 proprietary senators, 15 substitutes, and the ex-presidents of the republic, who had held office by direct popular election as senators for life. The chamber of deputies was composed of the other 40 representatives.

Somoza was inaugurated a second time on March 30, 1939. He immediately asked permission of congress to visit Washington, D.C., and left Nicaragua on April 20, 1939, in full exercise of his powers as president. Peace in Nicaragua remained undisturbed during his absence, and the country derived numerous benefits from his visit to President Franklin Roosevelt. In the economic sphere, Somoza succeeded in maintaining the stability of currency and obtained a loan of \$2,000,000 from the Export-Import Bank of Washington, later increased by an additional \$2,000,000 as Nicaragua complied fully with its commitments to pay. In the military sphere, a military academy was established, directed by a high officer of the United States army, in conformity with the agreement negotiated between Presidents Somoza and Roosevelt.

Somoza meanwhile had interested himself in the improvement of the national army, and the creation of an academy fulfilled his wish of forming a new, consolidated officer corps trained in the techniques of modern war and thus increasing the prestige of the only armed force.

In the international field, the president succeeded in modifying the Canal convention of 1914 (proclaimed in 1916), circumscribing the navigation of the San Juan river, an indispensable step in linking the country with the Atlantic, so that Nicaragua could fulfil its mission of being the country of transit on the continent.

Nicaragua was represented at the consultative meeting of foreign ministers at Panama on Sept. 23, 1939, held in agreement with the accords reached at Buenos Aires and Lima, in which continental solidarity had been declared to maintain peace on the American continent and to help re-establish peace throughout the world.

On March 1, 1940, the Military academy of Nicaragua began to function under the direction of U.S. Col. Charles J. Mullins, Jr., with 100 young Nicaraguans who had graduated from centres of secondary education. Soon the results of this training and the manifestation of discipline by the cadets came to be appreciated and received general approval.

In April 1940 a convention for the canalization of the San Juan river was signed by the representatives of Nicaragua and Costa Rica, Dr. Manuel Cordero Reyes and Tobías Zúñiga Montúfar, respectively, in accordance with the protocol signed in Washington, D.C., in 1939.

War Measures.—On Dec. 9, 1941, two days after the attack on Pearl Harbor, the national congress declared war on Japan and all axis powers, although it was maintained

President Anastasio Somoza reviewing cadets of the Nicaraguan military academy in 1943

in the senate that a declaration of war was unnecessary, as continental solidarity and international agreements obliged the government and people of Nicaragua in any case to counter aggression.

Nicaragua contributed materially to the victory of the United Nations by blocking the credits of totalitarian countries, confiscating their goods, and increasing its rubber production.

The United States co-operated actively in the construction of a wartime highway traversing Nicaragua from the frontier of Honduras to that of Costa Rica. A paved road of 171 mi. was also started to the Atlantic coast from a point called San Benito on the Pan-American highway to Rama, a navigable port on the Escondido river. With regard to this matter, President Somoza declared in Nov. 1942: "The construction of this highway is the result of conversations which I had with President Roosevelt in May 1939, and of later negotiations for the establishment in Nicaragua—with the financial co-operation of the United States government—of transport facilities between her eastern and western regions. It is stipulated in this agreement that the U.S. government shall contribute all the funds necessary for construction."

In 1943 the two parties in power tried to amend the constitution to make the re-election of the president possible if the state of war continued, and to incorporate the Atlantic Charter. The country opposed the measure violently, and Somoza vetoed the proposed amendment in 1944 under a threat of the people to hold a general strike.

In April 1944 the government sent two delegates to the parliamentary congress in Santiago de Chile, one of whom proposed the Pacific Charter, much commented upon in the South American press. Nicaragua was also represented at the Conference of Chapultepec on Feb. 21, 1945, and

at the United Nations conference on international organization at San Francisco on April 25, 1945.

Political agitation increased during 1945 and 1946, and the opposition demonstrated against the government during a state visit by President Ríos of Chile. Repression by the government of the leaders of ideological movements of subversive character was commented upon by the constituent assembly of Panama, and was made the object of attention by Foreign Minister Eduardo Rodríguez Larreta, of Uruguay, who maintained that the indivisibility of peace and the principle of nonintervention did not give unlimited protection to repeated violation by any republic of the fundamental rights of man and citizen; or that the disregard of commitments freely made by a state with regard to external and internal obligations did not entitle it to a place in international co-operation. The Nicaraguan foreign office informed Larreta that an internationally accepted definition of the democratic system of government and of the elementary rights of man and citizen was needed.

The electoral problem was strongly influenced by the political atmosphere. A group called the Independent Liberal party was formed by members of the National Liberal party; it united with the Conservative party and endeavoured to conclude an agreement under which both were to nominate an independent liberal citizen as presidential candidate, and divide equally the representation in the national congress. The National Liberal party nominated Dr. Leonardo Argüello as its candidate, and the Independents Dr. Enoc Aguado. The latter nomination was subject to approval by the conservative directorate. Before these agreements the liberals and conservatives made joint representations to be granted the supervision of the elections, which was denied to them.

On Aug. 23, 1946, President Somoza, making use of permission again granted to him for three months by congress, went again to the United States. Peace continued to rule in the country, and the whole public administration was influenced accordingly. There were rumours of a possibility that all parties might settle on a single candidate for the presidential elections of Feb. 1, 1947.

Social Progress.—During the decade 1937–46, the government worked intensively to improve social and material conditions. Social improvement was based on a reform in all branches of public instruction, and an increase in the number of primary, secondary and other schools. The Central university of Nicaragua was created, with its seat in Managua; the Normal school for men was founded and named for Franklin D. Roosevelt. In Jinotepe, department of Carazo, a modern building was constructed to house a model school to satisfy all pedagogical needs.

On Feb. 1, 1945, the government promulgated its labour code, which was sent by the executive to the national congress for its study and approval. This work was designed not only to grant labour fundamental rights but to regulate the fulfilment of labour's obligations.

An important event of 1946 was the celebration on July 24 in Managua, of the first centenary of the date on which the congress bestowed the title of city on the capital.

By the end of the decade, the country was well supplied with a network of roads. The capital was joined with the south as far as the border of Costa Rica by a road 90 mi. long, passing through the cities of Diriamba, Jinotepe, Nandaime, Ochomogo and Rivas. To the north it was united with Honduras by a highway of 146 mi., running through several cities of importance, such as Estelí, an important agricultural and cattle centre. From Sébaco, halfway along this highway, an important road branched

off on the side of Matagalpa, joining that city with Managua.

Work on sanitation was intensified throughout the country with the co-operation of the United States government. A building for the general health administration and its numerous sections and subordinate agencies was erected in the capital, as well as other units in all the 15 political divisions of the republic.

In connection with this aspect of Nicaragua's progress, the country was aided materially during the decade by the co-operation of President Roosevelt, to whom the Congress of the Republic gave the title "Benemérito de las Américas" (Worthy of the Americas), on April 14, 1945, in recognition of his work for world peace and his generous undertaking to unite the Americas.

On Nov. 23, 1943, the Instituto Indigenista Nacional (National Institute for Natives) was founded with its seat in Managua, and as an associated agency of, the Instituto Indigenista Americano (American Native Institute). The Government announced its intention to study the Indian problem in Nicaragua in all its aspects with the intention of improving the living conditions of the Nicaraguan Indians. (C. A. Ms.)

Nickel

World production of nickel increased by nearly a half under World War II demands, but even so a chronic shortage of supply remained. Fortunately, only a small part of the output was located in countries that fell into axis hands—including the relatively small amounts in Burma, the Netherlands East Indies, Norway and Greece, and a portion of the soviet output. Furthermore, much of the production capacity of these nations was reported de-

stroyed, and the axis secured little benefit in the way of nickel recovery. Petsamo, the former Finnish development of International Nickel, later known as Patchange, was in soviet Russia's hands, and the former small soviet output in other areas was materially increased. The domestic Norwegian output was continued under German occupation, but without the benefit of the Falconbridge matte formerly shipped from Canada, the output was small. Soon after the German surrender, the Falconbridge matte, which had been treated in Canada by International Nickel during the war, was again sent to Norway.

Table I.—World Production of Nickel
(Short tons)

	1937	1939	1941	1943	1945
Burma	1,359	1,015	?	?	?
Canada	112,453	113,053	141,129	144,009	121,978
Cuba	—	—	—	2,679	12,015
Greece	1,055	1,473	?	331	?
New Caledonia	12,787	11,712	11,459	8,128	4,771
Norway	967	1,219	1,000	636	?
U.S.S.R. (Est.)	2,200	?	?	12,300	14,800
United States	219	394	660	642	1,155
Total	132,400	134,500	178,600	183,000	168,600

The Canadian output, representing 85% of the prewar total, was increased by one-quarter during the war, but because of increased outputs elsewhere, dropped to 79% of the total in the peak year 1943, and to 72% in 1945. Production was well maintained in New Caledonia until 1941, and then suffered a sharp decline. The loss of the company's smelter in France made it necessary to ship the matte to the United States for treatment, and shipping difficulties were a heavy handicap. With the close of the war, it was expected to revert to final treatment in France, or possibly to erect a refinery in New Caledonia. Financed by the Reconstruction Finance corporation, and operated by a subsidiary of the Freeport Sulphur company, nickel production was started in Cuba in 1943, developing to an output of 12,015 tons in 1945. The postwar disposition of this plant was still to be determined.

The United States had no prewar output of nickel outside of a few hundred tons recovered as a byproduct in the electrolytic refining of copper, and war production from primary sources was even smaller; nor was secondary recovery of much assistance. For all practical purposes, the United States remained dependent on imports for its nickel supply, as is indicated in Table II.

Table II.—Nickel Supply in the United States
(Short tons)

	1937	1939	1941	1943	1945
Production	219	394	660	642	1,155
Secondary recovery	2,400	2,920	5,313	6,917	6,483
Imports*	54,438	64,796	124,130	141,249	122,528
Exports*	4,473	10,167	7,125	9,464	3,876

*Includes gross weight (not nickel content) of ore, matte, oxide and alloys.

The nickel content of imports was estimated at 118,293 tons in 1944, and 107,433 tons in 1945, the latter including approximately 87,600 tons from Canada, 4,400 tons from New Caledonia, 12,200 tons from Cuba and 3,200 tons from England.

Primary nickel consumption in the United States was reported at 96,252 tons in 1945, with year-end stocks of 10,883 tons at consumers' plants and 399 tons in transit; Metals Reserve stocks included 18,956 tons of metal in various forms. Consumption was distributed as follows: steel and cast iron 58,570 tons, nonferrous alloys 26,401 tons, high temperature and resistance alloys 3,951 tons, electroplating 6,368 tons, other uses 962 tons. (G. A. Ro.)

Nicola, Enrico de

De Nicola (1877–), Italian statesman, was born Nov. 9, 1877, in Naples and was graduated from Naples University at the age of 18 with a law degree. He was admitted to the bar and soon established a reputation as one of Italy's foremost criminal lawyers. Elected a deputy of the Italian chamber of deputies in 1909, he was re-elected in 1913, 1919 and 1921, and was president of the chamber of deputies from 1920–23. When the fascists elected De Nicola to the chamber on their ticket, he refused to take his seat and retired from politics in 1924.

In the summer of 1946, neither of the two leading candidates for the presidency of the provisional republic—Vittorio Orlando, former premier of the pre-Mussolini era, and Benedetto Croce, eminent philosopher—could muster enough votes to win; therefore the name of De Nicola, a compromise selection, was submitted to the assembly and he was elected by 396 out of 504 votes. He was slated to hold office until the elections of 1947, when a permanent president would be chosen.

See BIOCHEMISTRY; CHEMOTHERAPY; MEDICINE; VITAMINS.

Niemoeller, Martin

Niemoeller (1892–), German theologian, was born at Lippstadt in Westphalia on Jan. 14, 1892. Distinguishing himself during World War I as a submarine commander, he later turned to farming and then to theology, and eventually became pastor of the wealthy Dahlem parish of west Berlin. As an ardent nationalist and opponent of communism, Niemoeller participated in the Kapp putsch following World War I, which was directed against the socialist government in Berlin. Hostile to the Weimar republic, Niemoeller at first welcomed National Socialism and even joined the party, but in the

summer of 1933 events turned him into a defiant opponent of the Nazi effort to bring the Lutheran church under the domination of the totalitarian state. He continued to preach courageously at Dahlem against Nazi totalitarian control over the church until July 1, 1937, when he was arrested and imprisoned. Finally brought to trial in March 1938 on a charge of sedition, he was released, but was immediately rearrested by the secret police and was placed in a Berlin prison and then in the concentration camp at Dachau. Liberated by U.S. troops in May 1945, he was elected president of the executive council of the Confessional Protestant church in April 1946.

Night Clubs

During World War II, in cities like New York, a port of embarkation for troops and a crossroads for traveling servicemen and their families, thousands of people who had never ventured inside a night club before, found themselves at a ringside table, eating a chicken dinner, watching a floor show, dancing to a name band—and enjoying it. By 1942 business was up 25% to 100% over 1941. El Morocco kept its zebra-striped interior open for the first summer in its history. The Stork Club reported business 40% over the previous year. Boston's Club Mayfair and Satire Room were packed, and The Ranch in Seattle reported business almost doubled. Many socialites and some of the French names on the menus disappeared, but 1,200 people, mostly factory workers, were jamming Detroit's Bowery nightly.

Of course, there were troubles. Many clubs along the highways and byways had to close because of gas rationing. On April 1, 1944, the 5% federal tax was raised to 30%. Business declined as much as 75%, many clubs closed, and thousands of entertainers were dismissed. But returns on the new tax were disappointing, and three months later it was reduced to 20%. Business jumped back with amazing rapidity and kept on climbing. In 1945 the curfew was imposed, but the main result was a cut in the number of shows—probably a happy circumstance in view of rising entertainment costs.

In 1946 night club business had fallen off 25% to 30% from its wartime peak, but generally operators were not complaining. The former \$600,000,000 industry was still probably close to \$1,000,000,000.

New York.—In 1937, only the playboy tipped the captain, but in 1946 even a high school youngster fumbled for his dollar. And whereas in 1937 the average audience age was 30 or over, 18-year-olds were numerous in 1946. Formal dress disappeared during World War II and reappeared only slowly, even at the ringside tables. And many out-of-towners who formerly came in occasionally were now regular patrons on "yokel night" (Saturday).

Entertainment had changed little. The ingredients of the popular show remained the same—good singing, fast dancing, a funny comedian and colourful costumes. But where shows used to be revised every six or eight weeks, they ran six months or more by the end of the decade.

There was a shortage of talent, occasioned not so much by the war as by the fact that the disappearance of vaudeville left no training ground for youngsters. There were

Floor show at a Harlem night club on Lenox Ave., New York city. During the years of World War II, night club entertainers created a tempo to match those of war workers, servicemen and women on furlough and a general public stirred by the restlessness of the times

only the inexperienced or the well-known star; and radio and motion pictures competed for what was available. Milton Berle received \$7,500 a week plus a percentage, compared with \$1,500 in the '30s. Name bands came high too. Content in the '30s to play a night club because of "remotes" (nationwide hookups which guaranteed a following in the hinterland), in 1946 they could make their name through their recordings.

Other costs were up proportionately. Musicians and chorus girls formerly worked three shows, seven nights a week. By 1946 it was two shows for six nights. The chorus girl who earned \$35 in 1937 made \$65 in 1946. An act that would have cost \$200 then brought \$1,000 in 1946.

But the customers were paying. Drinks jumped from 50 cents or 60 cents before the war to 75 cents and up. A bottle of Scotch that would have brought \$12 in 1937 brought \$20. The average cheque of the late '30s was \$3; in 1946 it was \$4.50 to \$5.50. And there were many more cheques.

Clubs in 1946 were filled for both dinner and supper. Night after night people were turned away. It wasn't unusual for the Copacabana or Zanzibar to gross \$50,000 a week.

Chicago.—The "Peck's Bad Boy" of nightlife, Chicago maintained its reputation for the daring and the debauche during the decade. There was a mushroom growth of the strip-tease emporium. After 1937 six major night clubs and a dozen or more lesser ones—all dedicated to the art of defoliation—sprang up to challenge the popularity of the long-famous 606 Club and McGovern's Liberty Inn. Among the newcomers were the L&L Café, Club Flamingo, and the Playhouse, all goldmines.

The cost of food and drink at Chez Paree doubled during the decade, not to mention the jump in gratuities. Two bids were made to match it for first place honours—the Latin Quarter and Rio Cabana—but neither came close. The Empire Room still ranked highest in entertainment value as it did a decade before, and the Hotel Sherman's College Inn, renamed the Panther Room, was still the name band room of the city.

The main change in Chicago was in the audience. Society withdrew except for infrequent appearances at the Pump Room or Buttery or the Blackstone's Mayfair Room; a war-born cafe society replaced it—coarse and incautious with its cash.

Detroit.—In 1937 a dozen or so night clubs flourished in the downtown area of Detroit, most of them run by former speakeasy proprietors. But few of them made money in the club business. The floor show, \$1.50 dinner and 35-cent drink were come-ons for the gambling games that turned loss into profit. That era ended in 1940 with the start of the now-famous Graft grand jury that sent a Detroit mayor to prison and a grand juror to the U.S. senate.

But Detroit was never a night club town. The mortality rate remained high. Some closed for financial reasons—others because the Michigan Liquor Control commission lifted their licence for a minor infraction of the rules. One huge and beautifully decorated club changed hands seven times after Prohibition days, when it was a dance hall. Only two clubs had operated under the same management since 1937—one a neighbourhood establishment, the other Frank Barbaro's Bowery (located in suburban Hamtramck, however).

Miami.—The decade saw the night club business of Miami change from a small sociable trade to a big-volume,

heavy-spending business during the war, but by the end of 1946 it was slowly slipping back to its prewar status. There was a big decline in the late business. In 1937, the third show started around 2:30 a.m., but the curfew accustomed people to earlier hours, and by 1946 there were usually only two shows.

As in Detroit, there was a big turnover of operators. Of 30 clubs in Miami and Miami Beach in 1937, only three of the operators ran clubs there in 1946. Many clubs had changed hands several times. During the war, numerous dine-and-dance halls with name bands sprang up for servicemen.

There was a trend toward more elaborate entertainment, probably forced by Lou Walters and his Latin Quarter. Walters sold out to his partner and produced shows for the Terrace Club in the winter of 1945-46.

The city of Miami enacted a 25-cent head tax on night club attendance, but this seemed to have little effect on business at the Copacabana, the Beachcomber, the Little Palm, the Clover and other clubs.

Los Angeles.—The fact that Los Angeles was still running a poor second to Las Vegas as a night spot in 1946 was blamed on the midnight curfew still in effect. Los Angeles clubs fell into three categories: the glamour spots, hot spots and tourist clubs. Gasoline rationing, curfews and blackout regulations caused high mortality among the expensive glamour spots during the war. Only one remained open around Hollywood and Vine—the Mocambo. Others—Ciro's, the Troc and the like—were in full swing again in 1946 but not so profitable. The small hot spots, on the other hand, flourished during the war on the servicemen's trade; the Bandbox, Streets of Paris, Swanee and the rest featured hot, loud music and specialty acts, and were still faring pretty well at the end of 1946.

Tourist spots—Earl Carroll's theatre restaurant, Florentine Gardens, Slapsie Maxie's—were complaining of the curfew too, but Earl Carroll, whose \$2,500,000 place was the most lavish built after 1937, and who hadn't changed his show for two years had already announced plans for a \$5,000,000, 7,000-seat theatre-broadcasting studio-night club building.

London.—Because of the government's early curfew on the sale of drinks in licensed premises, there were still no night clubs, strictly speaking, at the end of 1946. Rather they were clubs where members paid initiation fees and dues and had their own liquor served all night. They became popularly known as bottle parties.

Once the vast floating population of money-loaded Allied soldiers departed, British night life slipped back to its prewar ways. Sixty per cent of the customers were wearing black ties and long dresses. Champagne, the night club drink of 1937, had dropped from its wartime price of £9 per bottle to a government-controlled £3 and was slowly climbing back to favour; but in general, drinking habits had switched from wines to spirits. Cuban bands had a great burst of popularity during the war, but proprietors believed the straight dance band was returning in the postwar years.

Business slackened after the war; the general atmosphere was about the same as in 1937 but there was less *joie de vivre* and more respectability in the night spots. Middle class provincials and tired businessmen were bringing their wives and daughters.

Paris.—There was a sameness and a difference, too, in Paris. There were changes in management and clientele, a little in entertainment, quite a bit in tone and enormous ones in the cheque (*la douloureuse*) but the leaders of 1937 were still the leaders of 1946—Monseigneur, Shehera-

Night life in Paris regained prewar levels of social gaiety in 1946. Patrons at the Lapin Agile, Montmartre, are shown listening to one of their group singing a popular French tune

zade, Casanova, Le Boeuf sur le Toit, the Florence.

The Bal Tabarin still packed them in with the same specialties—young nudes and grand-staircase production numbers—public dancing on the raised floor to the same braying band—and the can-can. Moulin Rouge, slowest to reopen, was practically unchanged from prewar days. Young Americans packed the Lapin Agile precisely as they did in 1937. The *boîtes* like Eve, Chantilly and the Paradise, still had the old patter. And the Boeuf's and Monseigneur's drawing cards were still the slickest dance orchestras in Paris. Casanova and Sheherazade still depended on the dim, *intime* atmosphere suited to seduction or despair. The only changes seemed to be an epidemic of acrobats of all kinds and a development resulting from war regulations: *boîtes* used to specialize in small dance orchestras. When the German occupying authorities banned dancing, the first violin started the old Hungarian routine of playing into the lady's ear. In 1946 the whole orchestra gathered around a single table for a few numbers, drowning out conversation and drinking the customer's health in his champagne.

But there were troubles. The number of *boîtes* had about trebled during the decade, but the number of customers had only doubled and there had been numerous failures. The war and immediate postwar period brought all sorts of headaches: first complete closure, then the re-assembling of scattered talent, scratching for occupying army permissions and a very uncertain supply situation. Then came blackouts, strictly enforced curfew regulations, bombings, price rises. Then the liberation, another shutdown, purges, new permissions and shortages. The autumn of 1944 brought electricity famine, early closing regulations, military police cleanups and salary increases. By

late 1945 things were improving, but even late in 1946 profits were small compared with those of 1937.

French night club finances continued to be based principally on champagne sales. In 1937, proprietors could buy champagne for 20 francs a bottle and sell it for 100 francs and up. Recognized brands cost 35 francs or 40 francs and sold at over 200 francs. In 1946 rationed champagne filled only 10% of their needs and poor black market brands cost 600 francs, good brands 1,000 francs. But it was sold for only 1,200 francs and 1,400 francs respectively. The average gross profit margin had dropped from 400% or 550% to between 40% and 60%. Customers did not drink as much, either. In 1937 a party of four might drink four, five or six bottles in an evening, but by 1946 it was from one to three bottles.

Clientele changed rapidly through the war years. The wehrmacht troops were not very gay, behaved in orderly manner and seemed to look for forgetfulness. The S.S., on the contrary, were arrogant, noisy and slightly sadistic. The G.I.s were rowdy, bawdy and noisy. By late 1946 soldiers were rare. Audiences had returned to prewar status but another element had been injected—the new black market well-to-do—a strange mixture of crook-types and enriched shopkeepers with shifty eyes, most of whom looked rather bored but didn't know what else to do with their new money.

Buenos Aires.—The big Tavaris and the swanky Alvear Palace hotel roof were still big and swank. Dance cabarets had sprung up all along Lavalle street. The biggest new entry since 1937 was the building of the great Casino at Mar del Plata, reputed to have more gaming tables than Monte Carlo. But unlike almost any other place in the world, prices were low, Argentina had an abundance of goods and almost no inflation. It was difficult in 1946 to spend more than \$1.25 on a good dinner in Buenos Aires,

and wines were 25 to 35 cents a pint, whisky 50 to 60 cents.

Rio de Janeiro.—Things in Rio were vastly different. Reputedly the city of night life, Rio never had much to offer other than \$3,000,000 casinos—the Urca, Atlantico and Copacabana and, out at gay Petropolis, the big new name of the war years—the fabulous \$13,000,000 Quitandinha. Each casino had its grille or *boite* with loud music, two shows seldom changed, a tiny dance floor and poor food. But gambling rather than conviviality made Rio's nightlife; and casinos were based on their gambling rooms. Indeed, gambling was Brazil's most profitable business; \$50,000 nightly was not an unusual "take" for the casinos and contributed a major part of the government's income.

But Brazil, after a tremendous war boom, with vastly more money than goods in spite of the fact that 75% to 90% of its population was too wretchedly poor ever to have gone into a casino, had a terrific inflation. Especially during 1945-46, when prices skyrocketed. In the interests of sounder finance, the Brazilian government in May 1946 decreed the end of licenced gambling and thus brought an end to Brazilian nightlife.

Mexico City.—In Mexico City there were still the cabarets where the female hostesses drank copious quantities of coloured water and got a cut on the bar trade. In the capital were hundreds of such places topped by big gaudy Waikiki and Cien Flores.

Three of the clubs were small, intimate, dine and dance spots with only occasional entertainment—Sans Souci, opened in 1944, Casanova, catering to native cafe society, and the expensive Minuit.

The two leaders in the field in 1946 were radically different types. The older El Patio, biggest and almost the only club of note in Mexico City before the war, remained a place of the people. The music-hall type, it continued to draw on the upper middle class Mexican. Run in a friendly fashion by a former waiter who made a fortune in tips at the old El Retiro restaurant, it catered to properly chaperoned young Mexican couples, to banquets, parties and fiestas—at moderate prices.

The biggest change of the war years in Mexico City's night life was the entrance of Blumey Blumenthal, who went down from the United States in 1940 and was depressed at what he saw. Here was a country on the threshold of its industrial age and entering a tourist boom, with no place to go but El Patio, neither lively nor distinguished nor expensive. Blumenthal, who had never operated a restaurant or nightclub before, took over the poorly-run, unprofitable Mayan Room restaurant in the Hotel Reforma, and in 1941 *Ciro's* was born. The minimum charge was set at 100 pesos on opening night. But *Ciro's* was an immediate success, and all Mexican night club prices later rose.

Nimitz, Chester William

Nimitz (1885-), U.S. naval officer, was born Feb. 24, 1885, in Fredericksburg, Tex., and was graduated from Annapolis in 1905. He was chief of staff to the commander of the Atlantic fleet's submarine force during World War I and was promoted to rear admiral on June 23, 1938. On Dec. 17, 1941, after the surprise attack on

Hawaii Adm. Nimitz was made commander in chief of the U.S. Pacific fleet with the rank of admiral. The fleet, weakened by the blow at Pearl Harbor, was a mere skeleton when Nimitz assumed his post at Pearl Harbor on Dec. 31, 1941. Nimitz quickly reorganized his combat teams and strategy and then built up a group of leaders, including Adms. William F. Halsey, Marc A. Mitscher, Richmond Kelly Turner, Raymond Amos Spruance and Thomas Cassin Kinkaid. Nimitz's command of the Pacific ocean area placed army and marine units as well as naval forces within his jurisdiction. Under his command, U.S. armed forces conquered the Solomons in 1942-43, the Gilbert Islands in 1943, the Marshalls, Marianas, Palaus and the Philippines in 1944 and Iwo Jima and Okinawa in 1945. Nimitz attended the Japanese surrender ceremonies aboard the battleship U.S.S. "Missouri" in Tokyo bay on Sept. 2, 1945. In December of that year he was promoted to the five-star rank of fleet admiral of the U.S. navy, and succeeded Adm. Ernest King as chief of naval operations.

Nitrogen, Chemical

World War II brought extensive developments in the replacement of natural sodium nitrate from Chile by other forms of chemical nitrogen, especially compounds synthesized from atmospheric nitrogen and by-product nitrogen from the coking of coal. During the war, the agricultural and industrial consumption of nitrogen doubled, while military consumption increased ten fold, rising to 600,000 tons a year, compared with a total consumption of 450,000 tons in 1939.

While there were marked increases in imports of Chilean nitrate and in production of by-product nitrogen, the bulk of the increased demand was supplied by synthetic compounds.

By-product ammonia output in the United States increased from 149,200 tons in 1939 to 224,423 tons in 1943, and 236,226 tons in 1944, declining to 218,680 tons in 1945. About one-sixth of the output was sold as ammonia, and the remainder converted into ammonium sulphate. Data on the output of synthetic ammonia were available only after 1943—543,804 tons in 1943; 544,156 tons in 1944; 548,655 tons in 1945; and 263,871 tons in the first half of 1946.

Imports of Chilean nitrate rose from 676,409 tons in 1939 to a peak of 899,785 tons in 1942, declined to 712,434 tons in 1944, and increased to 849,888 tons in 1945. Small amounts of mixed sodium-potassium nitrate were produced as a by-product in the recovery of sodium nitrate; imports of this mixture were 55,164 tons in 1939, but declined to 9,407 tons in 1944 and none in 1945. The chief imports of other nitrogen compounds were calcium cyanamide, ammonium sulphate and ammonium phosphate, but the sulphate receipts were partly offset by exports.

There were no data on the amounts of chemical nitrogen going into its various uses. Normally fertilizers and the chemical industry were the major consumers. During the war years the demand for chemical uses was greatly expanded by the large amounts of explosives required for munitions.

Nobel Prizes

There were no awards of Nobel prizes for 1940, 1941 and 1942, but the annual awards were resumed in 1944 with announcement of prize winners for that year and for 1943. A list of the prize winners in the five categories during the decade 1937-46, except for the early years of World War II, follows.

Physics.—The 1937 prize was divided between Clinton J. Davisson of New York and George P. Thomson of London, for experimental discovery of interference phenomena in the irradiation of crystals by electrons; 1938, Enrico Fermi of Rome, for proving the existence of radioactive elements produced by bombardment with neutrons, and for his discovery of nuclear reactions produced by slow neutrons; 1939, Ernest O. Lawrence of the University of California for his work in atom-smashing and his invention of the cyclotron. The prize for 1943 (awarded in 1944) went to Otto Stern of the Carnegie Institute of Technology for his research in the magnetic properties of protons; 1944, Isidor I. Rabi of Columbia university for his work with magnetism in atomic particles; 1945, Wolfgang Pauli of Switzerland for atomic studies; 1946, Percy W. Bridgman of Harvard for research on atmospheric pressure.

Chemistry.—The 1937 prize in chemistry was awarded to W. N. Haworth of Birmingham, for research on carbohydrate and vitamin C, and to Paul Karrer of Zurich for research on carotinodes and flavins and vitamins A and B₂; 1938 (awarded in 1939), Richard Kuhn of Germany for his work on vitamins; 1939, divided between Adolph Butenandt of Germany and Leopold Ruzicka of Switzerland for their research in sex hormones. The 1943 chemistry prize (awarded in 1944) went to Georg von Hevesy, Hungarian in Sweden, for his research with isotopes; 1944, Otto Hahn of Germany for his work in atomic fission; 1945, Artturi Wirtanen of Finland for his work in conservation of fodder. In 1946, half the award went to James B. Sumner of Cornell university for research in enzymes and the remainder was divided equally between John H. Northrop and Wendel M. Stanley of the Rockefeller Institute for Medical Research, for their work on viruses.

Physiological Medicine.—The 1937 prize was awarded to Albert von Szent Gjörgye University of Szeged, Hungary, for research in connection with vitamin C; 1938 (awarded in 1939), Corneille Heymans of Belgium for his research in the role of the sinus aorta in breathing; 1939, Gerhard Domagk of Germany for his discovery of prontosil. The 1943 prize, awarded in 1944, was divided between Edward A. Doisy of St. Louis university school of medicine, and Henrik Dam of Denmark for discovery of the nature of vitamin K. In 1944, the prize was split between Joseph Erlanger of Washington university, St. Louis, and Herbert S. Gasser, director of the Rockefeller institute, New York, for their studies of nerve threads. In 1945, the prize was divided among three men—Sir Alexander Fleming, discoverer of penicillin, and two of his co-workers, Sir Howard Walter Florey and Ernest Boris Chain, a German refugee in England. In 1946, the prize was awarded to Herman J. Muller of Indiana university for his work in genetics.

Literature.—1937, Roger Martin du Gard, French novelist and critic; 1938, Pearl Buck, U.S.A.; 1939, Frans Eemil Sillanpää of Finland. After 1939, no prizes were awarded until 1944, when Johannes V. Jensen of Denmark, novelist and poet, was honoured. In 1945, the prize was awarded to Gabriela Mistral (pseudonym of Lucila

Godoy), Chilean poetess, and in 1946 to Herman Hesse, German-born Swiss citizen.

Peace.—1937, Viscount Cecil of Chelwood, president of the League of Nations union; 1938, the Nansen office in Geneva. During 1939-43, there were no prizes awarded. In 1944, the prize went to the International Red Cross for its war work, in 1945 to Cordell Hull, U.S. secretary of state from 1933 to 1944. In 1946, the prize was divided between John R. Mott, U.S. evangelist, and Emily Greene Balch, honorary president of the Women's League for Peace and Freedom. (See also PULITZER PRIZES.)

Noel-Baker, Philip John

Noel-Baker (1889-), British statesman, was born Nov. 1, 1889, the son of a member of parliament. He attended Cambridge university, receiving his degree of master of arts in 1913. Before World War I, Noel-Baker had left the Liberal party to join the Labour party. During the war, he drove an ambulance for the Friends' Ambulance unit, serving in the front lines in France and Italy, and was decorated for valour by the British and Italian governments.

He was a member of the British delegation to the Paris peace conference in 1919, captained the British Olympic team in 1924 and was professor of international relations at the University of London, 1924-29. Elected to parliament on the Labourite ticket, he served in the house of commons from 1929 to 1931. He was returned to commons in 1936 and was appointed (1942) parliamentary secretary to Lord Leathers, minister of war transport in the Churchill coalition cabinet. After the Labourite victory in the general elections of the summer of 1945, Attlee named Noel-Baker minister of state; the latter also was made a member of the privy council.

He headed the British delegation on the executive committee of the U.N. preparatory commission and in Sept. 1945, he was named chairman of the subcommittee which prepared the tentative agenda for the general assembly.

On June 14, 1946, he was named chairman of the Labour party executive, succeeding Harold Laski and on Oct. 4, Noel-Baker was shifted to the post of air secretary, although he was retained as a delegate to the U.N.

Noguès, Auguste

Noguès (1876-), French army officer, was born in the Haute-Pyrenees department, France. He entered the École Polytechnique at the age of 21 and was commissioned as a lieutenant. He was stationed in Africa from 1908-14, saw field service in World War I and participated in the Riff campaign of 1924-26. Named resident general of Morocco in 1936 by Léon Blum, he was widely criticized for his use of the military in the suppression of strikes. At the outbreak of World War II, Noguès was made commander in chief of all French forces in North Africa. After the establishment of the Vichy regime, he pledged fealty to Marshal Henri Pétain, but in Oct. 1940 he warned both Spain and the axis countries that he would not surrender North Africa to any invading force, even if Pétain ordered him to do so. At the time of the U.S. landings in North Africa in Nov. 1942, Noguès ordered French troops to fire on U.S. soldiers debarking at Casablanca. After Allied occupation of North Africa became a *fait accompli*, however, he returned to Algiers and assertedly persuaded other recalcitrant French colonial officers to effect a compromise with De Gaulle's Fighting French armies. After the assassination of Adm. Jean Darlan, Noguès was appointed to

362 Gen. Henri Giraud's imperial war council on Dec. 27, 1942, and was retained as governor general of Morocco. In June 1943 Noguès, who was in De Gaulle's disfavour, submitted his resignation as governor general.

Nomura, Naokuni

Nomura (1886–), Japanese naval officer, was born in Kagoshima and was graduated from the Naval academy in 1907. Like his contemporaries—Toshio Shimada, Koshira Oikawa and Akira Nagano—he went through the usual mill of administrative and teaching posts before assignment to important commands. He was on the staff of the naval construction department, attended the London disarmament conference, was director of the naval submarine school and was naval attaché in both Berlin and Shanghai. He commanded a naval force in the North China seas, 1939, and became a member of Tojo's cabinet in 1941. Nomura was serving as head of a Japanese military committee in Germany which was co-ordinating axis strategy when the Japanese attacked Pearl Harbor, Dec. 7, 1941, and he left for home immediately thereafter. Nomura, who had been promoted to vice admiral in 1937, was raised to full admiral in March 1944. During the cabinet shakeup in July 1944 Tojo dropped Shimada as navy minister, replacing him with Nomura. The latter, however, held this post only a few days, relinquishing it on July 22, 1944, when Premier Kuniaki Koiso became premier. In Aug. 1944, Nomura was named to the Supreme War council and was made commander of the Yokosuka naval station. On Sept. 16, 1944, he was named commander in chief of the "supreme headquarters of the sea escort," a Japanese convoy protection service.

North Carolina

A south Atlantic coast state, popularly known as the "Old North state" or the "Tar Heel state," North Carolina is one of the original 13 states of the union. Area, 52,712 sq.mi. (3,570 sq.mi. of water); population (1940) 3,571,623, of which 974,175 (27.3%) were urban, 2,597,448 (72.7%) rural and 1,005,501 (28.2%) nonwhite. On July 1, 1944, the bureau of census estimated the population at 3,534,545. Capital, Raleigh (46,897); other cities: Charlotte (100,899); Winston-Salem (79,815); Durham (60,195); Greensboro (59,319) and Asheville (51,310).

On Jan. 7, 1937, Clyde R. Hoey (Dem.) was inaugurated as governor. The biennial legislature, meeting in January–March, rejected the proposed federal amendment empowering congress to prohibit child labour, but raised the prohibitory age for employment of children in industry to 16 years, and to 18 years for certain hazardous occupations. The first general labour law relating to maximum hours was enacted. The legislature also established an unemployment compensation commission to administer a fund, raised from taxes of 2.7% on the pay rolls of employers, from which unemployed workers might draw benefits of not more than \$15 a week for not more than 16 weeks a year. State prohibition, in effect after 1908, was ended by the establishment of a county option-state control system.

Other state officers in 1937 were: Wilkins P. Horton, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction and A. A. F. Seawell, attorney general. During the summer there was

held on Roanoke island a celebration of the 350th anniversary of the planting, by Sir Walter Raleigh in 1585–87, of the first two English colonies in America. The celebration was featured by the periodic presentation of Paul Green's drama *The Lost Colony* and the visit and address by Pres. Roosevelt on Aug. 18.

In the regular November election of 1938, the Democrats scored their usual victory over the Republicans, re-electing Robert R. Reynolds to the U.S. senate, electing a solid block of 11 congressmen, and winning 48 of 50 seats in the state senate and 113 of 120 in the house of representatives. In March, more than 89% of the cotton and tobacco farmers in the state voted for compulsory federal crop control, which was adopted in accordance with federal law; but in December, compulsory crop control for 1939 was favoured by only 64.6% of cotton and 57.4% of tobacco farmers in the state. In the December referendum, North Carolina gave the lowest percentage for federal control of cotton; and next to the lowest for tobacco (which was defeated) in the nation.

In the regular session of the legislature, Jan. 4–March 4, 1939, in response to the public demand for cleaner elections, the absentee ballot law was repealed for primaries and the use of markers and assistance to handicapped voters in primaries was restricted. The legislature adopted the revenue act as a continuing or permanent measure, except as it might be changed by subsequent legislatures. To meet the issue of graduate and professional education for Negroes, the legislature authorized two state Negro colleges to establish graduate and professional courses in liberal arts, agricultural and technical fields, law, pharmacy and library science; and in September this new policy was inaugurated in part.

In the 1940 Democratic primary, which was the cleanest and mildest in a decade, J. M. Broughton led the unprecedented field of seven candidates for the gubernatorial nomination and became the party nominee when runner-up Lt. Gov. Wilkins P. Horton declined to demand a second primary. In Nov. 1940 he was elected over his Republican opponent, R. H. McNeill, by the record majority of 413,342. R. L. Harris was elected lieutenant governor. Other state officers and congressmen (all Democrats) were re-elected. Conservative Governor Hoey sought to swing the state Democratic party to Cordell Hull for president, but the state convention in May endorsed for a third term Franklin D. Roosevelt, who carried the state in November over Wendell Willkie by the unprecedented majority of 395,382 in a total vote of 822,648.

The year 1941 was characterized by activity in national defense and war, by the inauguration of J. Melville Broughton as governor, and by the regular biennial session of the legislature which was unusually harmonious, brief, liberal and amenable to the new governor's leadership. The legislature contributed notably to educational development by doubling the support of vocational education, appropriating more liberally for public schools and higher institutions, increasing the salaries of public school teachers, adding a 12th grade to the public school curriculum, and adopting a retirement system for teachers and state employees. A 12th congressional district was created, and representation in the U.S. senate and house was reapportioned.

In the Democratic primary of June 1942, Josiah William

Re-enactment of "The Lost Colony," a symphonic drama by Paul Green presented on Roanoke Island, N.C., in 1937 to commemorate the 350th anniversary of the first English colonization attempts in America. The play described the probable fate of the second colony, whose mysterious disappearance was never solved

Bailey won the nomination for U.S. senator over Richard T. Fountain and was re-elected easily in November over his Republican opponent. In the November election, in which the vote was small, the Democrats won every judgeship, elected all 12 congressmen, including former governor and U.S. senator Cameron Morrison from the new district, and captured overwhelming majorities of both houses of the legislature. The voters also ratified two constitutional amendments providing for solicitor districts, and for the centralization of control of the public schools in one state board of education.

The first wartime legislature of North Carolina since 1865 adjourned on March 10, 1943, after a 55-day session. Notable legislative actions were the nine months' public school law, the granting of emergency war powers to the governor and council of state, the creation of a state school for delinquent Negro girls, the first authorization of state financial support for art and music, the establishment of unified administrative control of public schools, of state correctional institutions and of state institutions for mental defectives, the creation of a state postwar reserve fund of \$20,000,000, and the enactment of record maintenance appropriations with no increase in taxes. During 1943, an average of more than 300,000 young men were in training in nearly 50 military and naval installations in the state. At Kitty Hawk on Dec. 17, 1943, was celebrated the 40th anniversary of the first successful flight by the Wright brothers.

In the 1944 presidential election, Roosevelt received 527,399 votes and Dewey 263,155. Democratic U.S. Senator Robert R. Reynolds did not stand for re-election and was succeeded by former Governor Clyde R. Hoey, who defeated A. I. Ferree, his Republican opponent. For governor, R. Gregg Cherry won the Democratic nomination and defeated his Republican opponent, Frank C. Patton. L. Y. Ballentine was elected lieutenant governor. Other state officers were re-elected. In the November elections, five constitutional amendments were ratified providing that the commissioners of agriculture and labour and insurance be constitutional officers and members of the council of state, that notaries public be exempted from the constitutional prohibition against double officeholding, that the general assembly determine the compensation of the lieutenant governor, that the constitutional requirement of private examination of a wife for the validity of a deed made by the owner of a homestead be abolished, and that the state board of education consist of the lieutenant governor, state treasurer, superintendent of public instruction and ten appointees of the governor for eight-year terms—two from the state at large and one from each of eight educational districts.

R. Gregg Cherry was inaugurated governor in Jan. 1945. For the most part his recommendations were adopted by the legislature in a 67-day session characterized by relative harmony, caution and conservatism. The legislature made no major changes in the tax structure; no major increases for operating expenses; and no major appropriations for expansion. It left intact the \$20,000,000 postwar reserve fund set up in 1943, with the exception of earmarking \$5,000,000 for veterans' needs; and its first major act was to set aside about \$52,000,000 from the surplus, a sum adequate to retire all of the general-fund bonded indebtedness. Record-breaking annual appropriations of \$116,000,000 were held within estimated revenue. The 3% sales tax was removed from some items, but the tax on wine was sharply increased; the compulsory school attendance age was raised from 14 to 16; and a new state board of education was established and given control

over public school funds. New insurance laws greatly strengthened the power of the department of insurance. The state was made a self-insurer of its property from loss by fire, and a Veterans' commission was created to assist state veterans in securing all available legal rights and benefits.

During 1945 the legislature submitted to popular referendum a proposed constitutional amendment allowing equal rights for women, including jury service.

North Carolina did not contribute to the national Republican landslide of Nov. 1946. The new legislature elected had the usual overwhelmingly Democratic majority; and the state's congressional delegation continued solidly Democratic. The voters approved an amendment to make the constitution equally applicable to men and women as to jury service, suffrage and in other respects. State officers in 1946 were R. Gregg Cherry, governor; L. Y. Ballentine, lieutenant governor; Thad Eure, secretary of state; George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde A. Erwin, superintendent of public instruction; Harry McMullan, attorney general; W. P. Stacy, chief justice. (A. R. N.; X.)

missioner of agriculture and labour, Math Dahl; commissioner of railroads, Ben C. Larkin; supreme court judge (regular term), A. M. Christianson; supreme court judge (unexpired term), Thomas J. Burke; superintendent of public instruction, Arthur E. Thompson.

Principal state officers in 1939 were: U.S. senators, Lynn J. Frazier and Gerald P. Nye; representatives in congress, William Lemke and Usher L. Burdick; governor, John Moses; lieutenant governor, Jack A. Patterson; secretary of state, James D. Gronna; auditor, Berta E. Baker; treasurer, John R. Omland; attorney general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl; commissioner of railroads, Elmer W. Cart; superintendent of public instruction, Arthur E. Thompson; judges of the supreme court, W. L. Nuessle, chief justice; A. M. Christianson, A. G. Burr, James Morris, Thomas J. Burke.

In the presidential election of 1940 Wendell L. Willkie received 154,590 votes; Franklin D. Roosevelt, 124,036. In 1940 Gov. Moses was re-elected for a second term. Other state officers included: Oscar W. Hagen, lieutenant governor; Herman Thorson, secretary of state; Berta E. Baker, auditor; Carl Anderson, treasurer; Alvin C. Strutz, attorney general.

On the boundary line between North Dakota and Canada, in the region known as Turtle mountains, a park of 3,000 ac. called the International Peace garden was established in 1941 to commemorate the long-continued peace between Canada and the U.S.

Principal officers of the state in 1943 were as follows: governor, John Moses; lieutenant governor, Henry Holt; secretary of state, Thomas Hall; auditor, Berta E. Baker; treasurer, Carl Anderson; attorney general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl.

The presidential vote in the 1944 election was 118,535 for Thomas E. Dewey; 100,144 for Franklin D. Roosevelt; 943 for Thomas and 549 for Watson. Sen. John Moses (Dem.) replaced Gerald P. Nye (Rep.). Chief state officers, all elected in 1944: governor, Fred G. Aandahl; lieutenant governor, C. P. Dahl; secretary of state, Thomas Hall; auditor, Berta E. Baker; treasurer, Otto Krueger, attorney general, Nels G. Johnson; superintendent of public instruction, Arthur E. Thompson; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl; public service commissioner, C. W. McDonnell; tax commissioner, John Gray.

Sen. John Moses (Dem.), who replaced Gerald P. Nye (Rep.), died on March 3, 1945, and Gov. Aandahl appointed Milton R. Young to fill the unexpired term. (O. G. L.; A. V. O.; X.)

Northern Territory of Australia

The Northern Territory of Australia was transferred to the commonwealth government from the state of South Australia on Jan. 1, 1911. It extends from lat. 26° S. northward to the Arafura sea and is bounded by 129° and 138° E. Area: 523,620 sq.mi. Pop.: (est. 1946) Europeans 5,200, aborigines (est. 1945) 14,753. Capital: Darwin (pop. 1939 est., 6,200). The territory is controlled by the minister for the interior, the local administration being under an administrator appointed by the governor-general in council.

Immediately after the outbreak of World War II, the commonwealth government recognized the possibility of the extension of hostilities to the Pacific and realized that, in such an event, the northern portion of Australia would be extremely vulnerable and shipping to the northern ports would probably be terminated. A steady program of works, such as the construction of aerodromes, camps, fortifications, and strategic roads, was therefore put in hand and gradually accelerated as the indications of war close to home became more ominous.

Bitumen-surfaced roads were constructed from Alice Springs to Darwin, a distance of 959 mi. and from Tennant Creek to Mt. Isa in Queensland, a distance of 403 mi. When transport by sea was interfered with by the Japanese, these two roads carried practically the whole of the transport of troops, stores and supplies to the northern parts of the territory. When it became apparent that Darwin would be the scene of hostilities, the government evacuated all the women and children and nonessential civilians to the southern states and transferred the principal government departments to Alice Springs. There was a gradual transfer of control from the civil administration to the military authorities, and full military control came into operation on Feb. 21, 1942, after the first raid on Darwin. The Japanese raided Darwin and the northern part of the territory on 65 occasions. A considerable amount of damage was done to Darwin and a number of lives were lost.

The pastoral industry of the Northern Territory contributed in no small measure to the war effort. The works of military importance carried out during the war promised to be of considerable importance in the postwar

North Pole

See EXPLORATION, POLAR.

Northwest Territories

The Northwest Territories comprise the mainland portion of Canada lying north of the 60th parallel of latitude between Yukon territory on the west and Hudson bay on the east, together with the islands lying between the mainland of Canada and the North Pole and those in Hudson bay, James bay and Hudson strait. The area of the territories is 1,309,682 sq.mi. The population, according to the 1941 census, was 12,028, including 2,284 whites, 4,334 Indians, 5,404 Eskimos and 6 others. By June 30, 1946, the total had been increased by approximately 3,000 whites, most of whom were engaged in the mining industry.

Government is administered from Ottawa by a commissioner, a deputy commissioner and five councillors appointed by the governor in council. The council in 1946 consisted as follows: commissioner, Charles Camsell; deputy commissioner, R. A. Gibson; members of council, A. L. Cumming, K. R. Daly, R. A. Hoey and S. T. Wood.

The years 1937–46 constituted a period of great development in the Northwest Territories. The mining industry, embracing the production of petroleum, radium and uranium concentrates, gold and silver was vastly expanded, and the Yellowknife field established as a gold producing area of great potentiality. Facilities for transportation, particularly those by air, were expanded and improved, the fur trade was stabilized, steps were taken to provide wider protection for forests and wildlife and the government administrative staffs strengthened. Complementing the economic development was a broad program of scientific research, including geological, topographical, geodetic, hydrographic, biological, agricultural and wildlife surveys. Aerial mapping of a large part of the Mackenzie district

was accomplished, and other areas were being mapped as appropriations were provided.

Mining Boom.—The period 1937–46 was featured by the development of the gold mining industry in Mackenzie district. Discoveries of gold-bearing ore made in the Yellowknife river area on the north side of Great Slave lake in 1934 were followed by a major rush, during which several thousand claims north and west of Yellowknife bay were staked. Development of several of the most promising properties followed and in Sept. 1938, the first gold brick produced in the Northwest Territories was poured at the Con mine of the Consolidated Mining and Smelting Company of Canada. Additional properties which came into production included the Rycon mine of Consolidated, and that of Negus Mines, Ltd.—both adjoining the Con mine—in 1939; Slave Lake Gold Mines, Ltd. (now Philmore Gold Mines, Ltd.) on Outpost Island, and Thompson-Lundmark Gold Mines, Ltd., at Thompson lake in 1941; and Ptarmigan Mines, Ltd., near Prosperous lake, early in 1942. The Ruth mine of Consolidated, in the Francois lake area, was also brought to production stage in 1942, but owing to labour shortages the milling of gold was not commenced.

Mineral production in the Yellowknife district reached a peak in 1942 when gold valued at \$3,826,669 was mined. Of this amount nearly half came from the Con and Rycon mines. Silver production for the same year was \$9,500. Late in 1942 an increasing shortage of labour, brought about by war conditions, forced the Ptarmigan mine to suspend operations. By the end of 1943 all mines, with the exception of Negus, had either closed down or suspended gold production, and the mill of the latter was closed in Sept. 1944.

While gold production in the Yellowknife area declined in 1944, new developments that year foreshadowed increased activity. Diamond drilling carried out during the winter of 1943–44 on properties of Giant Yellowknife Gold Mines, Ltd. disclosed extensive zones of gold-bearing ore, and these discoveries precipitated another rush to the Yellowknife region.

During 1945 and 1946 exploration and staking extended in a broad arc for a distance of nearly 150 miles north-

Herd of reindeer in the government corrals on Richards Island, Northwest Territories

east and east of Yellowknife bay. Development work, including diamond drilling and shaft sinking, was undertaken on many properties. Among the more promising properties being developed were those of Giant Yellowknife Gold Mines, Ltd. and Crestaurum Mines, Ltd. Gold production was resumed at the property of Negus Mines, Ltd. in July, 1945, and at the Con mine in Aug. 1946. The total value of gold production in the Yellowknife district to the end of Oct. 1946, was \$14,938,000. In addition to gold, numerous other minerals were discovered in the Yellowknife area, including silver, lead, zinc, nickel, copper, tungsten and tantalum.

A sequel to the mining activity of the region was the development of the townsite of Yellowknife, on the west side of Yellowknife bay. To meet the needs of a greatly increased population additional areas were surveyed in 1945 and 1946. Numerous buildings, including a modern hotel, private residences, stores and government buildings, were in the course of erection in 1946.

The discovery of pitchblende, the ore of radium and uranium, on Echo bay, Great Bear lake, in 1930, had inspired a world-wide interest in the mineral possibilities of the Northwest Territories. The original find on Labine point was developed by Eldorado Mining and Refining, Ltd., and by 1937 the production of radium in Canada had become a well-established industry. War conditions, however, resulted in disorganized markets, and

Oil refinery at Fort Norman on the Mackenzie river, Northwest Territories, Canada. The Canol pipe line project was undertaken by the U.S. army to carry the huge petroleum reserves of the Mackenzie basin to the Alaska highway and beyond

with a large supply of concentrates on hand at the refinery at Port Hope, Ontario, operations were temporarily suspended at the mine in June 1940. Increased demand for pitchblende products resulted in the reopening of the mine in 1942, and subsequent developments resulted in the operation of the mill at capacity.

As one of the principal world sources of uranium and radium the pitchblende deposits at Great Bear lake assumed a new importance with the announcement of the development of the atomic bomb. The revelation of the part which uranium was to play in atomic research resulted in the placing under government control in 1944 of the mine, mill and other assets of the company, which thereafter were operated as a crown enterprise.

Canol Project.—An important achievement in the Northwest Territories during World War II was the expansion of the Norman oil field in the lower Mackenzie basin. The market for oil products was increased by the opening of gold mines at Yellowknife, and by 1940 a small refinery had been brought into operation.

Soon after outbreak of war with Japan an increased fuel supply for the use of the U.S. army in northwestern Canada and Alaska became imperative, and the Canol project was undertaken early in 1942. An agreement entered into by the governments of Canada and the United States involved a drilling program to determine the extent and capacity of the oil-producing area in the vicinity of Norman Wells, construction of a pipe line from Norman Wells to White Horse, Yukon territory, and the erection of a refinery at White Horse.

Imperial Oil, Ltd., which had pioneered the production of oil in the district, was appointed agent for the United States government and was awarded a contract for drilling and geological exploration. Drilling was commenced in 1942 and continued through 1943 and 1944 into 1945. In March 1944 the production of the field exceeded 3,000 barrels a day. Oil was delivered by pipe line to White Horse and the refinery there was opened in April 1944. On orders of the United States government drilling operations were terminated as of March 8, 1945. The pipe line and the refinery at White Horse ceased operations about April 1, 1945, and the contract with Imperial Oil, Ltd. was officially terminated on May 3, 1945.

During the period 1942-45 when the Canol project operated, a total of 67 wells was drilled, of which 60 found oil in commercial quantity. These wells outlined a field of more than 4,000 acres in extent, with an estimated recoverable reserve of 36,250,000 bbl. of crude oil. Prior to 1942 the production of the field totalled 118,895 bbl. During the life of the Canol project production was 1,858,447 bbl. The total production of the field to Aug. 1946 was 2,175,000 bbl.

The Canol project was a military enterprise undertaken for North Pacific defense, and when its objectives had been achieved economic considerations forced its abandonment. The closing down of the pipe line shut off the main market for the crude petroleum output of the Norman Wells field and most of the wells were later capped or plugged.

Norway

Norway is a country (hereditary monarchy) in northern Europe, bounded on the north by the Arctic ocean, on the east by the U.S.S.R., Finland and Sweden, on the south by the North sea. Area: 119,085 sq.mi. Population (est.) 1937, 2,906,100; (est.) 1940, 2,953,000; (est.) 1946, 3,121,000. Capital, Oslo (pop. 1943 est., 275,000). Other principal cities: Bergen (1943, 103,855), Trondheim (1930, 54,458) and Stavanger (1930, 46,780). Language: Norwegian, of Teutonic root, closely related to Danish and Swedish, akin to Anglo-Saxon, Dutch and German. Religion: Lutheran Christian. Ruler during the decade 1937-46 was King Haakon VII (after 1905); crown prince, Olav (b. 1903). Prime ministers of Norway during the decade 1937-46 were as follows: Johan Nygaardsvold (March 20, 1935-June 25, 1945), Einar Gerhardsen (after June 25, 1945).

Uneasy Peace.—The general elections (proportional representation) by the end of 1936 showed the stability of the political situation. Labour returned 70 (+1), the Conservatives 36 (+6), Left 23 (-1), Farmers' party 18 (-5), Commonwealth party 1 (as before), the Christian Popular party 2 (+1); two radical groups lost the one seat each of them had. The Communist vote was negligible and no candidate was elected. The Norwegian National Socialist party (N.S.) obtained less than 2% of the votes; no candidate was elected and the leader, retired Major Vidkun Quisling who was a candidate in Oslo, obtained about one-fourth of the votes necessary. The Labour cabinet (Nygaardsvold) remained in power until the German invasion on April 9, 1940. An heir to the crown was born to the crown prince and princess in 1937 and christened Harald after the first king of Norway.

Under an amendment to the constitution adopted by the storting in 1938, by a (nonpolitical) vote of 123 to 24, the term of legislative office was prolonged to four years,

meaning that the general elections which would regularly have been held in 1939 were postponed until 1940. Previously, the term of office had been three years.

Conditions in the country before the German invasion were most satisfactory; there was growing wealth, general progress and little unemployment. Under the impression of the Munich arrangement of 1938 the nation became more alive to the necessity of keeping up national defense, and the first efforts were made to build up again an army, navy and air force which had been neglected for years in the belief that the neutrality of Norway was inviolate.

At the outbreak of World War II in Sept. 1939 a declaration of strict neutrality was issued, and although the Finnish-Soviet war (1939-40) made a deep impression, there was no tendency to abandon the traditional neutrality. An Anglo-French demand for transit of troops to aid Finland was rejected, and in the League of Nations assembly which expelled the U.S.S.R. (Dec. 1939) Norway abstained from voting. German sinking of Norwegian ships and aerial and maritime warfare along the coast of Norway made neutrality more and more complicated. The U.S. ship "City of Flint," in charge of a German prize crew, anchored at Haugesund without permission on Nov. 3, 1939. It was released by the Norwegian authorities and the German crew was interned. In March 1940 the German government steamer "Altmark," sneaking along the coast of Norway with a number of British prisoners on board was attacked by British destroyers in Norwegian waters at Joessing fjord.¹ The Norwegian government protested in strong terms. Great Britain maintained that German submarines operated from Norwegian territory and had sunk British ships in Norwegian waters; there was a growing irritation because Swedish ore continued to be exported to Germany by way of Narvik and on April 8 Great Britain declared that it had mined Norwegian territorial waters at several points. The strong Norwegian protest was forgotten in the surprise of the German invasion the following day, when every important port was attacked. (See WORLD WAR II.)

The Quisling-Nazi Tyranny.—King Haakon, the storting and the government evacuated to Hamar in the morning of April 9; the Germans failed to capture any of the organs of national sovereignty. At Hamar, and when that city had to be evacuated, at a night meeting at Elverum with only eight members absent, the storting unanimously gave the government every authority that was needed and, also unanimously, agreed to residence of the king and government outside Norway during the war if need be, in conformity with article 11 of the constitution. The small Allied forces which had landed in Norway left in the first days of June; King Haakon and the government evacuated from northern Norway June 7, and for five years thereafter London, England, was the seat of the Norwegian government.

Quisling had proclaimed himself prime minister of Norway on April 9, but being unable to form any government he was withdrawn by the Germans; to prevent chaotic conditions the supreme court of Norway appointed an "administration commission" for the occupied parts of the country. This commission was approved by the king. The German Reichskommissar Josef Terboven worked incessantly to bring about some interim government with a pretense to legality. After the king had left Norway, Terboven tried to force the leaders of parliament to de-

¹The name Joessing was later perpetuated as meaning an enemy of the nazis; a loyal, uncompromising Norwegian.

German infantrymen, dismounted from their bicycles, replying to an ambush on a Norwegian road in April 1940

clare that Haakon had forfeited his right to the crown. He threatened to send the entire youth of Norway to concentration camps in Germany if leaders did not comply, and he promised to refrain from all governmental interference if his request were granted. The *storting* could not meet constitutionally, but members were invited to come to Oslo; the political groups met and discussed an extension of the administration council. The presidential committee of the *storting* was forced to address a letter to the king asking him to abdicate, leaving open to the peace to come the question of succession.

King Haakon refused and stressed his duty to remain loyal to his people and the government. The political leaders finally declined to come to terms with Terboven, and on Sept. 25, 1940, he dissolved all parties except the National Socialist, set up a "state council" with a number of Quisling puppets, declared that King Haakon was dethroned and Norway "indefinitely occupied by German troops." A reign of lawlessness started. The entire supreme court of justice resigned in Dec. 1940 in order not to lend any show of legality to German acts of arbitrary terror, and Paal Berg, the chief justice after the liberation, was publicly acclaimed as leader of the home front.

The history of 1940-45 was a story of ever more obstinate resistance against ever increasing tyranny, growing terror and torture, more and more power being given to the *gestapo*, ever greater numbers being sent to concentration camps in Norway and in Germany, of hostages being shot, of civilians and officers being executed on any pretext, of wanton cruelty and of patient, enduring heroism. The fight to a large extent was a spiritual fight, and in their bid for the youth of Norway the Germans were completely frustrated. The teachers took a firm stand. There were 1,700 arrested, hundreds were sent to do

forced labour, some were shot, schools were closed, but the Germans lost. On Feb. 1, 1942, Quisling was made head of the German-controlled government and started to interfere in church matters. The seven bishops resigned in protest on Feb. 24. The primate, Bishop Eivind Berggrav of Oslo, was imprisoned and remained prisoner until the liberation, but he continued to wield a great influence; 1,100 clergymen resigned, the state church (to which 97% of the population belonged) and the various religious organizations established a joint council, *Kirkens Samraad*, and in July 1942 severed the connection between the state and the church. Quisling dictated that anybody who gave economic support to any resigned clergyman could be imprisoned and have his fortune confiscated. But the church emerged triumphant. Quisling did not succeed in retaining more than about 40 pastors and after the liberation church and state were united as before the invasion.

The Quisling government also tried zealously to gag the universities. Prof. Didrik Arup Seip, rector of the Oslo university, was sent to a German concentration camp in 1942 where he remained till the fall of Germany. Hundreds of students were sent to concentration camps in Germany with professors, poets, journalists. And the resistance gained strength.

The food situation grew more and more desperate. There were very considerable stores of foodstuffs in Norway at the time of the invasion. The national policy, built on the lessons of the blockade in World War I, had been to keep reserves for two years. These reserves were taken to Germany and the country was systematically robbed. When the food situation became desperate in 1943, Terboven made the statement that it was of no

interest to Germany if some 10,000 Norwegians should die from starvation. Had it not been for the aid given by Denmark and Sweden, Terboven's prediction would have materialized. More than 100,000 children were given meals by Swedish organizations, and thousands of food packages poured in from Denmark. The German forces in Norway had been gradually increased to some 375,000 who lived off the country. To this figure must be added large numbers of civilians and about 150,000 prisoners of war. Norway had to pay 150,000,000 kroner a month for the benefit of occupation; any pretext was used for confiscation and the levying of fines. When liberation finally came, Norway's claim to reparations from Germany amounted to 22,963,000,000 kroner or about 8,000 per inhabitant.

In 1942 the entire village of Televaag (near Bergen) was wiped out for the killing of two Germans; every house was burned down in the forced presence of the inmates; the men were shot and the women and children deported. A terrible explosion in Bergen wrecked the 13th-century King's hall, *Haakonshallen*, and the great 16th-century *Rosenkrantztaarn*. In 1942 and 1943 Quisling organized persecution of the few Jews in Norway (not quite 1,400 at the census in 1930, but nearer 2,500 in 1940 on account of refugees having come in). They were all arrested, their property confiscated and 1,500 were sent to Poland. In Oct. 1943 a new decree stipulated the death penalty for any disobedience of orders. It only consolidated the opposition.

Air raids, British-Norwegian commando raids along the coast and the constantly more expert and militant system of sabotage in Norway were annoying the Germans more and more, and to their usual acts of terror was added in the fall of 1944 the complete destruction of the province of Finmark and northern Troms. The commander in chief in Norway, General Nikolaus von Falkenhorst, had been given command over the German army in Finland but had to give way to the victorious Soviets who, in Oct. 1944,

Armoured "invasion barges" raiding Norway's Lofoten Islands on March 4, 1941. The British blew up oil tanks and withdrew with 215 German prisoners and 323 Norwegians

crossed the border to Norway. On Oct. 25 Kirkenes was reported taken, and in November small Norwegian forces from Great Britain landed and fought with the Russians. The Germans declared a scorched earth policy, evacuated the population, destroyed completely every town and village, burned down every farmhouse and stable, blew up lighthouses and churches, killed the cattle and the reindeer and threatened to make Norway a wasteland.

Activity in Exile.—The Norwegian government had been most active after its establishment in London, building up an air force, a navy and the nucleus of an army. Training camps were established in Canada, boys by the hundreds came out of Norway into Sweden across Asia and the Pacific to join up; others crossed the North sea in small boats. The gold reserves of the Bank of Norway had been taken safely out and across the Atlantic. London became the seat of the bank; and thanks to the revenue from the Norwegian merchant marine the Norwegian government was able to carry through without touching the gold reserves and without issuing any loan, and was able to pay the usual interest and to amortize Norwegian external loans. The Norwegian merchant marine, one of the biggest in the world, with its tanker fleet was one of the great assets of the Allies, active on every sea and suffering severe losses. During the war 661 Norwegian ships of 2,351,000 tons were sunk, with a loss of more than 4,000 sailors. But from beginning to end the services rendered were inestimable. At the landings in Normandy, every tenth ship flew the Norwegian flag.

The crown princess with little Harald and her daughters had crossed over to Sweden after the invasion, but by the end of Aug. 1940 she arrived with her family in New York, travelling by way of Petsamo aboard the "American Legion." Until the liberation she made her home near Washington,*D.C.

Dr. Halvdan Koht, who had been foreign minister from 1935, resigned in Nov. 1940 and was succeeded by Trygve Lie, who remained in office until he was elected secretary

general of the United Nations in Feb. 1946. Relations between the government and the home front were most intimate. In 1941 Paul Hartmann, burgomaster of Oslo, went to London to be the representative of the home front in the government. Men from the central administration, experts, lawyers were summoned from Norway as the governmental machinery in London was built up; they came by way of Sweden or across the North sea. Messengers from the government were dropped from planes or sent by way of Sweden. And as terror in Norway increased the number of Norwegians getting across to Sweden constantly grew; the number of refugees reached a maximum of approximately 50,000. These had to be organized, cared for and fed by the Norwegian authorities.

In 1944 an arrangement was made with the Swedish government to give the young men a modern police training in camps under Norwegian military command; when liberation was in sight 10,000-15,000 of these men were sent into Norway to help the voluntary military organization inside the country.

The whole merchant marine was operated as a state concern from the early days of the invasion. Social institutions were built up for the sailors and schools were organized in Great Britain and in Sweden. Laws were also promulgated. Under the Norwegian constitution the king in council could enact laws when parliament was not in session, such laws to be confirmed or rejected by the storting at its first following session.

Capital punishment had not existed in Norway after 1876, except for soldiers under arms in times of war. It was found necessary to introduce it again. The radio and the illegal press—hundreds of small sheets spread all over Norway—brought home the news, despite German con-

Norwegian, wearing a black hood, identifying Gestapo agents from among the Norwegian regular army at Oslo in 1945. With him were Allied intelligence troops prepared to take charge of prisoners

fiscation of radio sets, and despite the threat of execution for listening to London or being found in possession of illegal papers. A number of penal laws for treason, collaboration with the Germans and war profiteering were prepared by lawyers in Norway and sent over to London for final adjustment and adoption; similarly the government sent to the home front drafts of laws and decrees before they were enacted. In this way the necessary legal and administrative mechanism was made ready to put Norway in order when V-day should come. This was particularly needed in all matters relating to finance and to central and municipal administration.

Liberation.—As the fall of Germany became imminent, Mil-Org., the secret military organization in Norway, stepped forward and when liberation came on May 8, 1945, Mil-Org. was able to lend a most efficient assistance to the Allied forces which came to Norway. The German major generals Frantz Boehme and Hermann Hölter signed terms of surrender with Brig. Gen. R. Hilton of the Allied Control commission. There had been widespread fear of a Nazi last stand in Norway and Quisling resistance. The fears came to nought. Reichskommissar Terboven committed suicide; so did his chief of police Lt. Gen. W. Rediess, Quisling's police minister Jonas Lie and his right-hand man Henrik Rogstad. The others surrendered. It was found that 350,000 German soldiers were still in Norway; also more than 100,000 prisoners of war—74,000 Soviet slave labourers, Poles, Yugoslavs, Czechs. The 40,000 young boys of Mil-Org. had a tremendous task in supervising the Germans and liberating the others. Four thousand seven hundred U.S. soldiers came to assist, many of them of Nor-

wegian ancestry, and 13,000 British soldiers.

The Germans were disarmed and brought into camps and by July 1945 were being transported out at the rate of 25,000 per week. The Soviets and other slave labourers were repatriated. Fifteen thousand Soviet troops had come to Norway's aid in the north; the last left Finnmark on Sept. 25 with scenes of mutual gratitude. By the middle of October the U.S. soldiers had departed, and by the end of the year the British had left.

Crown Prince Olav was appointed commander in chief of Norway's military forces. He arrived in Oslo on May 13 with three members of the Nygaardsvold cabinet. On May 31 C. J. Hambro, president of the storting, Premier Nygaardsvold and the other ministers arrived. It was a month of jubilation never to be forgotten in Norway. Church bells chimed throughout the land; 1,200 patriot prisoners were released from the notorious Grini camp and many more from various other concentration camps spread over the country. The crowning glory was the return of King Haakon on June 7, exactly five years from the day when he had left Norway. With him were the crown princess, Prince Harald and his sisters, who had been flown over to England after the liberation. King Haakon sailed in on the "Heimdal," the old navy yacht which had brought him to Norway in 1905. Hundreds of thousands greeted him in the fjord and on the quays and along the streets of Oslo—the most overwhelming manifestation of the tremendous personal popularity of the king who had been a national symbol of strength and unity all through the war. Pres. Hambro summoned the storting, all constitutional legalities were intact, the nation could go to work and normal political life be re-established more quickly and smoothly than in any other country that had been under occupation.

Reconstruction.—Premier Nygaardsvold had broadcast from England long before the liberation that his government would resign as soon as it was back in Norway and hand the reins of government over to those who had stayed at home during the war. The storting met on June 10. Two days later the government handed in its resignation. The king asked Chief Justice Paal Berg to form a cabinet, but he declared that he was too old (73) and referred the king to Einar Gerhardsen, mayor of Oslo, one of the leaders of the Labour party just returned from Sachsenhausen concentration camp in Germany. Gerhardsen formed what might be called a home front cabinet with members of all parties from Conservatives to Communists but with no parliamentarians.

There was a growing tension between the storting and the home front leaders, who felt that a storting elected in 1936 gave no adequate expression to the political sentiments in 1945. Under public pressure the members of the presidential committee who had signed the letter to the king in 1940 resigned; it was obvious that the storting was not popular, but it was essential to good order in the country. On June 29, 1945, the odelsting by a vote of 104 to 4 approved the royal decree introducing capital punishment and on July 2, by a vote of 36 to 2, the lagting approved the law as adopted by the odelsting. Other important laws were enacted concerning penalties for collaboration, parliamentary and municipal elections, banking and financial problems.

Unanimously the storting ratified the United Nations charter and made Norway a member of the U.N. Other important conventions and treaties were ratified. The government could not lay a regular budget before parliament, but necessary appropriations were voted and the first important steps were taken toward financial recovery

and stabilization of currency; 5 kroner to the U.S. dollar and 20 kr. to 1 pound sterling were fixed as the rate of exchange. On Sept. 9 all the old banknotes were called in, all holdings registered and new banknotes issued. War profiteering and tax evasion were hard hit, but the question of a special tax on all increase in fortune during the war years was left to the new storting.

Meanwhile, war criminals and traitors were brought to justice. About 17,000 collaborators had been jailed, prosecuted and sentenced in the most orderly and correct way. On Sept. 10, 1945, Quisling himself was found guilty of treason, murder and theft, after a very full documentation, and was sentenced to death. He appealed, but the supreme court upheld the verdict on Oct. 13; Mrs. Quisling's special appeal was denied by the cabinet on Oct. 22. The puppet leader whose family name had become internationally synonymous with despicable treason was shot at 2:40 A.M. on Oct. 24. Some of his cabinet ministers met the same fate, as did members of his police force found guilty of torture and murder. But the number of executions did not reach 50. Ill-begotten fortunes were confiscated, leading Quislings were sentenced to forced labour and all who joined the National Socialist party after the invasion or remained members, were punished. Gen. von Falkenhorst was sentenced to death at Nuernberg for shooting British and Norwegian prisoners; on appeal the sentence was commuted to imprisonment for life.

General elections were held on Oct. 8, 1945. During the years of war the political party organizations (all forbidden by the Germans) had declared a truce and efforts were made to continue this policy of national collaboration and restraint. A national program of reconstruction was elaborated by a joint committee of all political parties from Communist to Conservative and it was agreed that the election campaign should last only one week. One result was that public interest in the elections was less keen than before the war. On Oct. 8 for the first time in many years no kind of working agreement or alliance was established between any two parties. An attempted amalgamation of the Labour party and the Communists came to nought in a storm of bitter dissensions and recriminations. There were more parties and more candidates running than ever before, but on Oct. 8 only 73% of the electors went to the polls (in 1936 the percentage was 84.2). The Conservatives lost 16% of their prewar vote, the Farmers' party 30%, the Left 14% and Labour 1.5%. The Communists gained 163,300 votes and the Christian Peoples' party 98,200 votes. The result was a new parliament of 25 Conservatives (36), Farmers' party 10 (18), Left 20 (23), Christian Peoples' party 8 (2), Labour 76 (70) and Communists 11 (0).

There was a strong reaction against members of the old storting who had been willing to discuss terms with Terboven in 1940. There was also a public demand for new men who were not too intimately tied up with the old political parties. Only 40 members were re-elected, and 110 new men and women. (In 1936, 104 members were re-elected, in 1933 and 1930, 96.) Eight women were elected, a larger number than ever before.

On Nov. 5 Gerhardsen reconstituted the government. The ministers not belonging to the Labour party, the two communists, disappeared. The composition of the cabinet was as follows: Einar Gerhardsen, prime minister; Trygve Lie, foreign affairs; Kaare Fostervoll, church and public instruction; Oscar Torp, supply; Lars Evensen, commerce; Sven Oftedal, social affairs (these carrying over from the

Crown Prince Olav of Norway returned to Oslo in May 1945 aboard the British destroyer shown in the background. Still clad in British uniform, he is shown standing at attention during the playing of the Norwegian national anthem

earlier cabinet); Jens C. Hauge, defense; Erik Brofoss, finance; Oscar C. Gundersen, justice; Kristian Fjeld, agriculture; Nils Langhelle, public works; and the following consultative ministers, all new: Aslaug Aasland, social affairs; Reidar Carlsen, fisheries; Peder Holt, reconstruction. This was the youngest cabinet in Norwegian history, with five of the ministers under 38 and the average age 44. The members of the storting were somewhat older, on the average 50% as against an average of 52½ after the election in 1936. When Lie was elected secretary general of the U.N., Halvard M. Lange, also from Saxenhausen prison camp, was appointed foreign minister. No member of the government except Torp had ever been a member of the storting or taken any active part in national political life. After the election the new cabinet demanded that the newly elected storting should meet immediately instead of on Jan. 11, 1946, as under the letter of the constitution.

The government could not dissolve the storting; the storting itself had to declare its work to be terminated. In order not to provoke a constitutional conflict, the storting (Nov. 4) unanimously decided to make use of Art. 83 of the constitution and demand an advisory opinion from the supreme court of justice. The court declared it within the power of the storting to authorize a convocation of the new storting before Jan. 1946; on Nov. 24 the storting unanimously declared that its work had come to an end and authorized the meeting of the newly elected storting. This took place on Dec. 4. Nearly every member of this storting had been active in the resistance or in actual warfare. Of 150 members 54 had been in German prisons, and 20 others had been in exile during the war. In the same way most of the members of the government had been prisoners in Germany or in Norway.

The two Gerhardsen cabinets each included a woman; the first woman to be appointed a cabinet minister was Kirsten Hansteen (Communist, widow of the legal adviser to the council of trade unions in Norway, one of the first victims killed by the Germans); the second was Aslaug Aasland. For the first time the new storting elected a woman chairman of one of the permanent committees (of public health), Claudia Olsen (Conservative, president of the National Council of Women in Norway).

The government and the new storting were faced with a tremendous task of rehabilitation, building up again the public administration which had disintegrated during the occupation and recreating a sound financial order in the country. The budgetary year 1945-46 showed a deficit of about 1,003,000,000 kroner. And the proposed budget for 1946-47 had a deficit of 776,500,000. The policy of the government was stabilization—a stable level of prices, including the price of labour. Great efforts at equalization were made; there was a strict control of prices. The farmers received a compensation to keep a low price for milk, meat, etc.

The ships of the merchant marine were handed over to the individual owners shortly after the liberation, and in July 1946 the storting approved an arrangement reached between the government and the ship owners whereby the latter were refunded 1,600,000,000 kroner for the use of the ships and for ships lost during the war years. To speed up reconstruction of houses all over the country, and particularly in the devastated areas, new laws were prepared giving owners full compensation on a 1939 valuation plus 50% in all, about 1,500,000,000 kroner. To finance this operation a special tax was to be laid for ten years on all real estate in the country.

On June 5, 1946, an amendment to the constitution was adopted unanimously by the storting. (The constitutional rules for adopting amendments remained very strict; this amendment had been proposed by the government in 1938, but such proposals could only be discussed after new general elections.) From 1814 to 1920, 25 years was the age of suffrage; in 1920 the age limit was lowered to 23; in 1946 it was lowered to 21 as part of the joint program before the elections in honour of the heroic resistance of the youth of Norway during the occupation.

In July 1946 the storting adopted the necessary laws and rules for levying a special tax on war profits. All increase in fortune after the invasion (exceeding 5,000 kr. for each individual) was liable to tax: 30% of the first 10,000, 50% of the next 20,000, 70% of the next 40,000 and 95% of any higher amount.

The Norwegian government took over German factories and plants bought or built up in Norway during the war, thus giving the state a greater direct interest in indus-

try than it had before. Similarly, the storting in July 1946 approved the organizing of great government-owned iron works (in Mo in northern Norway), the building of which with transmission of electric power would cost about 300,000,000 kroner.

To meet the housing problems which were very acute, particularly in Oslo and Bergen and all devastated areas, a provisional law was passed by the storting giving municipal authorities the right to requisition rooms or buildings to lodge homeless, and limiting the number of rooms at the owner's individual disposal in new houses to be built.

Another problem which caused some anxiety immediately after the liberation was the future of children born of Norwegian mothers and German fathers during the occupation. There were about 8,000, but, mainly through the Norwegian Red Cross, all had been adopted within 18 months after the liberation, some by Swedish but most by Norwegian families, except those whose mothers were allowed to go to Germany to join their husbands.

There was a very strong revival of interest in national defense. The storting appropriated 300,000,000 kroner to buy war materials, including U-boats and corvettes; the ordinary expenditures for the armed forces voted were six times the prewar amount. And the Norwegian government accepted its modest share in the occupation of Germany with about 4,000 men.

A great expansion of the diplomatic and consular services took place. In recognition of Norway's war effort Pres. Franklin Del-

ano Roosevelt on May 17, 1942, raised the U.S. minister to the Norwegian government to ambassadorial rank. The United Kingdom, the U.S.S.R. and later China and France followed the example, and the Norwegian ministers to Washington, London, Moscow, Paris and Chungking were appointed ambassadors.

General municipal elections were held in Nov. 1945; they showed the same tendency as the national elections, considerable gains for Communists and Christian Popular party, corresponding losses to the older parties giving as a result a Labour-Communist majority in large sections of the country.

Norway participated in the London assembly of the United Nations in Jan. 1946; in the last assembly of the League of Nations in Geneva, Switzerland, in April 1946, in the Peace conference in Paris, France, July–Sept. 1946, and in the New York city meeting of the general assembly of the United Nations in Oct. 1946. Unanimously the starting ratified Norway's membership in the United Nations Educational, Scientific and Cultural organization. The national policy was to support every effort of co-ordinated international collaboration and at the same time make clear a determination not to belong to any bloc—eastern or western.

Nova Scotia

Jutting far out into the Atlantic ocean in relation to the rest of Canada, the 21,068 sq.mi. of Nova Scotia, one of the dominion's four original provinces, are almost entirely surrounded by salt water. Inland there are 325 sq.mi. of fresh-water lakes. Only the 15-mi.-wide Chignecto isthmus joins the provincial peninsula to the mainland, and most of the north and all of the east and south coast line is exposed to Atlantic gales. The west side, washed by the bays of Fundy and Chignecto, and the northeast side, washed by the Strait of Northumberland, are more protected.

Steady but unspectacular growth marked Nova Scotia's population from 1931 to 1941, with the cities expanding at a slightly faster rate than the rural areas. But World War II accelerated this trend greatly, and the 55% rural composition of the 1941 census was markedly reduced by 1946. The figures were as follows: (1931) 512,027; (1941) 577,962; (1946 estimate of the dominion bureau of statistics) 621,000. Halifax, the capital, suffered severely from overcrowding during the war years: (1938) 65,889; (1941) 70,488; (1943 estimate) 126,000. Other centres were Sydney (28,305) and Glace Bay (25,147).

Basically, in 1941, the population was about 75% British, 19% French, 3% Dutch, 2% German. Four smaller groups shared the balance. The 1941 census also revealed 5 major religious denominations—Roman Catholic (188,944), United Church of Canada (124,301), Anglican (103,393), Baptist (89,272), Presbyterian (47,415) and several much smaller denominations.

Lieutenant governors for the 1937–46 decade were: Robert Irwin (May 1, 1937–June 10, 1940); Frederick F. Ma-

thers (June 10, 1940–Nov. 30, 1942) and Lt. Col. H. E. Kendall (after Nov. 30, 1942). Premiers were: Angus L. Macdonald (Sept. 5, 1933–July 10, 1940); A. S. MacMillan (July 10, 1940–Sept. 8, 1945) and Angus L. Macdonald (after Sept. 8, 1945).

For more than half of the 1937–46 decade Nova Scotia played a front-line role in Canada's war activities, and during the entire period it was governed by Liberal administrations very largely endorsed by the electorate. In the 1937 election the Liberals won 25 of the 30 seats in the legislature; in the 1941 election 23 seats; in the 1945 election 28. Efforts by the Conservatives to return to power, and the Co-operative Commonwealth Federation to establish itself, came to nothing.

Much Liberal legislation during the period was aimed at promoting industrial expansion, since manufactures accounted annually for the lion's share of the province's production. A department of labour was organized in 1936; in 1937 it authorized collective bargaining rights throughout the province; by 1938 it had full control of conditions and hours and rates of pay for employment and had set up industrial standards.

In 1943 a royal commission on provincial development and rehabilitation was appointed to study problems relating to postwar expansion of industry and markets, and re-employment of ex-servicemen and war workers. In 1944 a committee on rehabilitation of agriculture studied rural electrification, land conservation, flood control. The government worked out a detailed plan for postwar expenditures of \$40,000,000 on highways, public buildings, education, rural electrification and the development of natural resources.

In 1945 a research council was established with an endowment of \$1,000,000 to explore the province's natural resources, determine potential industries, expand existing industries and find more markets. In the same year the department of industry increased its financial service to fishing, agriculture and other major industries, and to smaller home industries such as weaving, pottery, wood carving and the production of Irish moss.

Nova Scotia processed more raw materials from mine and forest, manufactured more goods, grew more food and caught more fish during World War II than in the preceding years. At the start of the 1937–46 decade annual production was about \$150,000,000; by 1943 it had increased to \$333,000,000 with the peak still to come. The number of industrial employees doubled and capital investment increased by 50%. The per capita national income in 1939 was \$277; in 1944 it was \$562. The number of radios and telephones per hundred went up about 40% during the period.

Curtailment of war-generated activity was sharply felt throughout the province toward the end of the decade, notably in port tonnages handled and in shipbuilding and repair. Mining, particularly coal mining, however, suffered during and because of World War II. Shortages of skilled labour, when many miners enlisted, pulled down production. In an effort to restore output and yet not create depressed areas, the mine operators began a higher degree of mechanization in 1945.

Despite labour shortages and shipping problems and even despite a decrease in farm capital investment over the decade, Nova Scotia's farm production soared. With from one-third to one-half of Canada's apple supply coming from the Annapolis valley a further increase in farm income came when a \$250,000 apple cold storage plant was erected in the valley with government help. In 1946 the provincial agriculture college was enlarged to provide fur-

ther training in scientific farming and thus capitalize on war-made gains.

Although fishing was only fifth in dollar value in Nova Scotian economy during the 1937-46 decade, it was nevertheless the livelihood of many communities because of the province's extended shore line. Moreover, wartime demands for food expanded the market, and the catch went up from \$9,000,000 in 1936 to \$23,000,000 in 1944. To hold this gain the government offered scholarships to train fisheries leaders, set up a permanent fisheries survey division and established publicly-owned facilities for processing and marketing the catch. Most notable assistance was financial help for construction of offshore trawler choppers controlled by the fishermen who manned them. The draggers increased the per manday catch. A far-reaching private enterprise development came in 1945 when a large group of financiers organized National Sea Products, Ltd., a co-ordination of about 40% of the privately-owned fish com-

panies of the province. An international fisheries problem arose in 1946 with the invasion of the Quero banks by large-tonnage Portuguese and French trawlers which threatened to deplete the areas.

In common with the other maritime provinces, Nova Scotia turned attention to tourism. In 1945 the government set an example for other provinces by creating a \$250,000 fund from which it made cheap long-term loans to tourist resort operators to increase their facilities. In the same year biological survey parties were sent into the lake and stream-dotted forests to increase the salmon and trout for sport fishing.

(C. Cy.)

Novikov, Alexander Alexandrovich

Novikov (1905–), Russian air officer, was an infantryman at the beginning of his military career, but transferred in the late '30s to the air force. When Germany invaded the U.S.S.R. in June 1941, Novikov was a major general directing air planning operations. He considered his main task that of saving the Red air force from complete extermination by the numerically superior luftwaffe. He ordered Russian aircraft factories to concentrate on the construction of fighter planes, and manoeuvred the air forces under his command with telling effect and skill. Novikov was promoted to the rank of lieutenant general

in Nov. 1941, and in 1942 he succeeded Lt. Gen. Yakov Smushkevich as chief of the Red air force. He personally conducted soviet air operations during the battle of Stalin-grad, and was made a colonel general in Jan. 1943. In Feb. 1944 Stalin appointed him Russia's first marshal of the air forces, a post especially created for him. Under Novikov's direction Russia's air force was built principally for tactical purposes. He committed his air fleets to close support of ground troops, and strategical long-range bombing attacks occupied only a minor position in his concepts of air strategy.

Novikov, Nikolai V.

Novikov (1903–), Russian diplomat, was born on Feb. 7, 1903, in Leningrad. A graduate of the Oriental institute in Leningrad in 1930, Novikov also studied at the Institute of Professors of the World's Economics and Politics at Moscow from 1935 to 1938. Entering the soviet diplomatic service, he was first attached to the foreign office in Moscow, and was appointed in Oct. 1943 minister to Egypt. In addition, he was named ambassador to the governments in exile of the Balkan countries then centred in Cairo. Novikov served as a delegate to the United Nations San Francisco conference in March 1945, and acted as chargé d'affaires and minister-counsellor in the soviet embassy in Washington. On April 10, 1946, he succeeded Andrei Gromyko as ambassador to the United States. During the Paris peace conference in that year Novikov was a member of the Russian delegation.

Nursing, War

In 1870 the United States had only 1,200 professional nurses. In following years their number steadily increased until by 1941, 365,000 were on duty or in nursing schools. Major fields of nursing developed during this period, including institutional, industrial, private practice and public health nursing.

With the coming of World War II, the nation was no more prepared to meet the serious drain on nurse power than on other specialized types of manpower. As early as 1939, however, nursing authorities were on the alert as war spread from one foreign country to another. In 1940, representatives of professional nursing organizations, and of government agencies concerned with nursing, met to plan a nursing service as part of the national defense program.

This group organized a Nursing Council on National Defense which later became the National Nursing Council for War Service. A subcommittee on nursing was established as a part of the Health and Medical committee in the Office of the Defense Health and Welfare Services. The function of this subcommittee was to make over-all plans for war nursing needs and to co-ordinate war nursing activities.

For many years the American Red Cross had been the official recruiting agency of nurses for the armed forces. With the formation of the subcommittee, a concerted effort for immediate recruitment was made through the co-operation of all the member organizations of the National Nursing Council for War Service. This led later to the establishment of the Procurement and Assignment Service for Nurses in the War Manpower commission.

As the first step in the recruiting program was a determination of available nursepower, a national inventory of nurses was begun in 1940 by the U.S. public health service at the request of the National Nursing Council for War Service. By 1941, almost 300,000 registered nurses returned questionnaires. In June of that year, congress appropriated more than \$1,000,000 to be administered by the U.S. public health service to assist schools of nursing in the preparation of nurses for national defense.

Refresher courses were offered with the result that many older nurses and many married nurses returned to full or part-time duty. Nursing schools made an effort to enrol more students than ever before. Training courses were telescoped so that graduate nurses would be available sooner. Scholarships and other inducements were offered to augment enrolment.

In order to relieve professional nurses of duties which could be performed by other personnel, the American Red Cross began in 1941 to train volunteer nurses' aides. By April 1944, about 120,000 women had completed the 80-hour course. Later, the civil service commission recruited nurses' aides for paid positions in hospitals.

Lack of Nursepower.—To equalize the withdrawal of nurses for war service from all areas and types of work, and at the same time to secure more efficient utilization of those who remained in civilian areas, the National Nursing Council for War Service requested that a division

of nursing be set up in the War Manpower commission. This division was established in 1943.

In 1942, the National Nursing Council for War Service, having declared military needs to be paramount, urged that the services of private duty nurses be restricted to the care of acutely ill patients. The civilian nurse shortage became more and more serious; demands upon those who were still available became greater and greater. Civilian hospitals lost many of their physicians to war service and had to rely more and more on their depleted nursing staffs. This shortage of both medical and nursing services in civilian hospitals occurred at a time when unprecedented demands were being made for such services. For example, in 1943, 1,000,000 more patients were treated and 500,000 more babies were born than in 1941.

Industry, too, made greater and greater demands on nursepower. The number of nurses in industry increased from 2,200 in 1937 to 12,838 in 1943—almost sixfold in six years. Shipbuilding, aircraft production, manufacture of ordnance material and associated war activities absorbed many nurses.

More nurses than ever before were needed in physical fitness programs for school children, in child-care centres, and as instructors in first-aid and home-nursing courses. Concentration of migratory workers in war industry areas created a need for nurses in temporary camps.

In addition to civilian demands for public health nurses, federal requirements outside the military expanded. Specialists in psychiatric, orthopaedic, pediatric, obstetric and communicable-disease nursing were wanted in ever-increasing numbers. By 1946, more than 20,000 public health nurses were employed in various nursing capacities in the United States and territories by local, state and national agencies.

Cadet Corps.—As it became apparent that something had to be done to stimulate the enrolment of student nurses in schools of nursing, the United States cadet nurse corps was established in July 1943 under the provisions of the Bolton Nurse Training act. Administered by the public health service, the corps provided scholarships for qualified young women and grants-in-aid to schools whose curricula and clinical facilities met the standards set up by the service in co-operation with an advisory committee on nurse education.

The Nurse Training act also provided funds to prepare graduate nurses for positions requiring advanced study. As provided by the act, grants-in-aid were given to approved schools of nursing for tuition, fees, maintenance, uniforms and monthly allowances for student nurses; and for maintenance, tuition and fees for postgraduate courses.

The function of the U.S. cadet nurse corps was three-fold: recruitment of additional student nurses, more rapid preparation under an accelerated program and more equitable distribution of nursing services. Hospitals without schools of nursing were given more nursing services through affiliations and through use of the services of senior cadets which, in turn, enabled hospitals with schools of nursing to enrol more students.

Expanded enrolment of student nurses in the U.S. cadet nurse corps also made it possible for hospitals to release more graduate nurses to the armed forces. Senior cadets gave actual service in the military hospitals as they prepared for military service on graduation. Graduate corps members formed a reservoir from which the armed services could commission nurses.

From the inception of the corps in 1943 to Oct. 15, 1945, the final date for new admissions, 177,004 young women participated in the program. More than 1,100 schools of

nursing were approved for basic programs. By Feb. 1946 corps strength was about 115,000. Both as student nurses and as graduate nurses, these young women served in essential civilian hospitals and health agencies. In the three-year period ending June 30, 1946, 19,023 graduate nurses also received aid for advanced study.

Although in May 1944 the army announced that it had reached its goal of 40,000 nurses, it sent out an urgent call in Jan. 1945, for 10,000 more. By July 1944 the navy had 8,400 nurses and needed 3,200 more, asking for recruits at the average rate of 500 a month. So desperate was the need for nurses in all theatres of operations and in military hospitals at home, that a bill to draft graduate nurses 20 to 44 years of age was passed in the house of representatives in March 1945. A spectacular increase in army and navy nurse corps enlistments was precipitated by the conviction of need created by the president's message and by the subsequent congressional hearings on the bill. Because of the magnificent response and the progress of the military campaigns, the bill was withdrawn before action was completed in the senate.

Nurses in War.—During the years of World War II, U.S. nurses showed not only professional ability but also personal bravery and devotion to duty. Awards and decorations received by army nurses totalled 1,606, and many entire units received the Meritorious Service Plaque. There were 67 army nurses interned at the Santo Tomás prison camp in Manila. Approximately 196 army nurses lost their lives during World War II from accidents, disease and enemy action. Up to May 1946, approximately 100 members of the navy nurse corps were given military awards for distinguished service in line of duty in the course of World War II; 16 were imprisoned by the Japanese; 29 lost their lives.

The status of nurses was raised during these years as indicated by the action of several government agencies. Nurses in the armed forces were given commissioned rank by act of congress. The creation of the department of medicine and surgery in the Veterans' administration, on Jan. 3, 1946, by Public Law 293, opened the way for the establishment of greater professional opportunities for nurses, physicians and dentists so that leading professionals in these fields were attracted to the Veterans' administration. By fall of 1946, the number of nurses in that agency had doubled over the number prior to World War II. Throughout the whole federal civil service, nurses received a higher rate of pay and reclassification to professional grade.

Also contributing to improvement in the status of nurses was Public Law 346, 78th congress (the G.I. Bill of Rights). Under the provisions of this law, women veterans, including nurses, were entitled to the same privileges as men. Taking advantage of the educational benefits of the bill, many nurses enrolled at universities for graduate study.

Higher Standards.—In the U.S. public health service, expansion of organized nursing activities was accelerated after Dec. 7, 1941. A permanent commissioned corps of nurse officers, including a reserve corps, became an integral part of the service. For the first time, registered nurses were appointed as commissioned corps officers. Nurses were assigned to hospitals, medical relief stations and dispensaries under the jurisdiction of the service, and to federal prisons and special projects. In nation-wide health programs of the public health service, nurses assisted in tuberculosis, mental hygiene, venereal disease control, sanitation, industrial hygiene activities and in all fields of public health nursing.

The trend was to set higher and higher educational

standards for nurses and to demand more and more academic training to enrich their practical experience. Nurses hoping to fill administrative, instructional, consultant and specialized positions such as nurse anaesthetist, research assistant and technician were expected to expand their usefulness by graduate study in colleges and universities providing programs in these specialties.

During the ten eventful years 1937-46, legislation enacted by congress authorizing programs of mental health research and of hospital construction aroused the interest of laymen, the medical profession and government agencies. To carry out the provisions of such federal legislation required an increasing number of nurses in government and nongovernment organizations. Likewise, expanding health programs in the children's bureau, the Office of Indian Affairs, the public health service and the Veterans' administration increased the demands on the nation's nursepower.

In addition to the reservoir of graduate nurses, the nation needed to draw upon a steady stream of student nurses. The number of full-time graduate nurses required for the postwar population was estimated at 359,500. To meet these needs, the National Nursing Planning committee, organized in 1944 under the auspices of the National Nursing Council for War Service, prepared a five-year plan for nursing. This plan included maintenance and development of nursing services in all fields, a program of nursing education, channels and means for distribution of nursing services, implementation of standards, and an information and public relations program.

Great Britain.—The nature of the war effort and the exposure of Great Britain to air attack in World War II made a strict line of demarcation between war and civilian nursing impossible; although army, navy and air force hospitals were set up, a far greater use than in World War I was made of all types of civilian hospitals, where service wounded were nursed with civilians. British nurses served with the British forces in every theatre of war, often working close up behind the battle. Besides state registered nurses, mobilization involved a large number of V.A.D. (voluntary aid detachment) members, enrolled by the British Red Cross society (B.R.C.S.) or the Order of St. John, who were mobile and who worked with the nurs-

U.S. army nurse checking in a stretcher case on a hospital train in England during 1943

ing services in army, navy and air force hospitals both in Great Britain and abroad.

Under the auspices of the ministry of health, an emergency medical service with a civil nursing reserve of trained nurses, assistant nurses (later enrolled under the Nursing act of 1943) and nursing auxiliaries was in readiness. A large number of the auxiliaries were members of the B.R.C.S. or the St. John Ambulance brigade. These organizations, at the request of the ministry of health, also provided a number of auxiliary hospitals and convalescent homes, largely staffed by their own members.

England and Wales were divided into 11 regions for purposes of the emergency medical service, a principal matron being appointed in charge of the nursing side, with 12 regional nursing officers; comparable arrangements under the control of the department of health were made for Scotland. In 1941 the principal matron was also appointed chief nursing officer to the newly established division of nursing at the ministry of health. A number of E.M.S. hospitals were established by taking over the whole or part of the large mental hospitals, making use of all existing hospitals available, often with the addition of hutments, and by converting suitable buildings. The area around London was divided into ten sectors, each with a medical and an administrative officer in charge and a sector matron, with one of the large teaching hospitals as the key hospital of each. Co-ordination between the voluntary and municipal nursing services was ensured by

the association of liaison sector matrons with sector matrons.

Under the auspices of the port of London authority, a river emergency service was organized, ten pleasure steamers being converted into mobile first-aid posts on the Thames. The dispersal of staffs caused by the large-scale evacuation of London hospitals often involved the concentration of large groups of nurses from several hospitals in a single sector hospital. This led to many problems of administration and to much planning to retain a satisfactory standard of nursing education. Nursing recruitment was pressed forward by both voluntary and statutory bodies; in Scotland it was undertaken by the Scottish board of the Royal College of Nursing until 1945.

Many special demands were made upon nurses during World War II. Their services were claimed in connection with first-aid posts, air-raid shelters, rest centres, refugee camps, wartime nurseries, evacuation of mothers and children to reception areas, children going abroad under government schemes, rehabilitation plans, etc. For the benefit of war workers in munition and other factories, a great increase had to be made in the number of industrial nurses.

Nuts

The four principal nut crops of the United States, pecans, walnuts, almonds and filberts, became an industry returning nearly \$100,000,000 in 1946 following a decade of steady expansion. Since nut plantations come into bearing slowly, the increase was not the result of sudden war stimulation, although the advancing price did lead to more careful picking and to some wider harvest of wild seedling varieties of pecans.

Pecans, the most widely-grown commercial nut crop, were also first to be grown for market in the United States. Wild pecans, like wild walnuts and hickory nuts, had been harvested from colonial times. In 1937 a high production of 22,900,000 lb. of improved varieties averaged 10.9 cents per pound in price. By 1945 this crop had grown to 56,979,000 lb. and the price was about 27 cents per pound. The crop of wild seedling pecans in 1937 was 53,900,000 lb. and in 1945 75,603,000 lb. Pecan growing of improved varieties was largely centred in Georgia, which produced more than half of the total crop of improved varieties in 1945. The centre of the wild or seedling crop was in Texas and Oklahoma, which produced three-fifths of the total crop in 1945. Louisiana and Alabama were also important producers of the wild varieties. The record crop of pecans was 140,165,000 lb. in 1944—54% above the 10-year average 1933–42. The total crop in 1937 was 76,800,000 lb. Pecan prices for all varieties were at a low point of 7.7 cents per pound in 1937 and rose steadily to a top of 23 cents per pound in 1943. Improved varieties reached a top of 28.5 cents in 1943. Pecans were imported up to 1935, but after that year there was a large balance of exports, amounting to nearly 4,000,000 lb. in 1944.

The Persian or English walnut crop centred in California, with Oregon increasing in importance during the decade 1937–46. Before 1937 the California crop ranged between 25,000 tons and 50,000 tons, except in a few bad years. By 1937 this crop had grown to nearly 60,000 tons. In 1941 it made a record of 63,000 tons. Oregon produced 2,600 tons in 1937 and 7,000 tons in the good year 1941. The total walnut crop was 70,000 tons in 1941 and then declined through 1946. Labour shortage at harvest affected output adversely during the later war years. Imports of Persian walnuts frequently were large, exceeding the amount of the domestic crop until 1935, when a balance of exports began. The price of walnuts ranged from \$181 per ton in 1937 to \$478 per ton in the last year 1943. The leading walnut-producing countries were France, Italy, Turkey and Bulgaria, in that order. The total production outside the United States was about 2,000,000 bags of 110 lb. each in 1937 and only 800,000 bags in 1944.

The almond crop, confined to California, ranged be-

tween 6,000 tons and 23,100 tons from 1937 to 1945. The price advanced in this period from \$275 per ton in 1937 to \$748 per ton in 1944. Almonds were also produced in large quantities in Italy, Spain, Iran and Portugal. Total production of the countries outside the United States was estimated at about 60,000 tons average before World War II, and 52,000 tons in 1944. United States imports increased from about 5,100 tons in 1937 to 37,492 tons in 1944.

More than 90% of the U.S. filbert production came from Oregon and Washington. The crop developed into an important commercial product after 1930. In 1937 Oregon produced 2,230 tons and Washington only 340 tons. By 1943 the Oregon crop had increased to 6,200 tons and the Washington crop to 830 tons, a total crop of 7,030 tons. Prices advanced from \$217 per ton in 1937 to \$540 per ton in 1944.

Tungnut production became important enough to be reported in 1940. It developed in the Gulf coast states, where the number of young trees was increasing rapidly. The census of 1930 reported 351,000 trees in the southern states and in 1940, 12,671,000 trees. The crop of 1940 was 11,000 tons; 1941, 8,750 tons; 1942, 16,350 tons; 1943, 6,200 tons; 1944, 26,680 tons; 1945, 37,080 tons and 1946 47,300 tons. Mississippi led in production, with Louisiana and Florida next in order. The price rose from \$41 per ton to \$100 per ton in 1944. Imports of tungoil amounted to 97,049,000 lb. in 1940 but declined to nothing by 1943. (See also COCONUTS; PEANUTS.) (J. C. Ms.)

Oats

The U.S. oats crop, second in importance to corn as livestock feed, increased steadily in importance until 1915, when the first crop exceeding 1,400,000,000 bu. was harvested. This record was approached again in 1917, 1918, 1920, 1924 and 1925, after which a ten-year decline began. In 1937 the crop began to increase again and expanded to a production of more than 1,547,000,000 bu. in 1945, an all-time record. The yield was high, 37.3 bu. per acre, compared with a 10-year average of 29.6 bu. during 1934–43. Oats production varied widely from year to year, and two large crops seldom came in succeeding years. The poorest year in the 20th century was 1934, when the total crop was only 542,306,000 bu. The crop declined between the two world wars because of the decreased need for oats as a horse and mule feed as numbers of these animals were replaced by the tractor, truck and automobile. But the use of oats as a feed for dairy stock and poultry increased in later years. The yield of oats was high in the 1940–45

Other states produced less than 1,000,000 bu.

period and about the same as in 1915-19, although improved seed was being more generally used. New varieties were more disease-resistant, and special varieties for the southern states increased production in that area. More commercial fertilizer was used with profitable results. The crop shifted with the competition of soybeans in the corn belt, the acreage declining in Illinois, Iowa, Ohio and Indiana while it increased rapidly in the Dakotas, Minnesota and Wisconsin. The proportion grown in the northeast and Appalachian states decreased.

The price of oats advanced more slowly than did other feed grains and did not advance to the same high levels. Through 1940 and 1941 oats averaged about the same as in the prewar period 1935-39. A sharp advance came in 1943, followed by a decline lasting through 1945, then another advance to a new high in 1946. The price of oats was supported by the government through loans on stored oats based upon the rates on corn and relative feeding values. The ceiling price of oats was raised five cents per bushel in May 1946. Stocks of oats were higher at the beginning of 1946 than in any previous year of record. The shortage of corn and barley was offset by the use of larger proportions of oats in mixed feeds, though oats were less desirable.

World oats production was confined largely to the United States, Canada and Argentina. The Argentine and Canadian crops were below average during most of the decade 1937-46, and since the grain did not enter largely into international trade, the demand was limited to that for domestic feed needs. Imports of 55,000,000 bu. to the United States were due to the feed shortage in 1942, and a larger import of 77,800,000 bu. occurred in 1944. Previous to 1939 the balance was in favour of exports. (J. C. Ms.)

BIBLIOGRAPHY.—For statistics of acreage, production see U.S. Dept. Agric., *Agricultural Statistics; Hdbk. Official Grain Standards* (1941).

Obituaries, 1937-46

The following men and women of prominence died

during the years 1937 to 1946, inclusive. The list is arranged in alphabetical order, year by year.

Name	Birth date	Death date
1937		
ABDULHALIK HAMID, Turkish poet	1852	Apr. 13
ADLER, ALFRED, Austrian psychologist	Feb. 7, 1870	May 28
ALDRICH, RICHARD, U.S. music critic	July 31, 1863	June 2
AMES, WINTHROP, U.S. theatrical producer	Nov. 25, 1871	Nov. 3

404 Ohio

A north central state of the United States, Ohio is popularly known as the "Buckeye state." Area, 41,222 sq.mi., including 100 sq.mi. of water. Population (1940) 6,907,612, of whom 2,294,626 were rural and 4,612,986 urban; native white 6,047,265, foreign-born white 519,266, Negro 339,461, other races 1,620. Capital, Columbus (306,087). Other cities of more than 100,000: Cleveland (878,336); Cincinnati (455,610); Toledo (282,349); Akron (244,791); Dayton (210,718); Youngstown (167,720) and Canton (108,401). On July 1, 1944, the bureau of census estimated the population at 6,836,667.

Ohio's flood disasters in 1937 were the greatest in its history. On Jan. 18 all river cities were inundated, from Steubenville to Cincinnati. Gas was shut off in most of the cities, and electric power plants were closed. On Jan. 22, the estimated number of flood refugees in Ohio had risen to 140,000 and the state began to raise a rescue army. One day later the American Red Cross took over the relief work. On Jan. 24, the Ohio river at Cincinnati had risen to 77.4 ft. and fire had broken out there which caused a loss of more than \$1,000,000. The next day it was estimated that 550,000 were then homeless. City Manager C. A. Dykstra was given complete control of flood activities in Cincinnati and Gov. Martin L. Davey signed an emergency act passed by the state assembly allotting \$250,000 to flood relief. On Jan. 28, the river reached a flood stage of 79.99 ft. at Cincinnati, the highest in history. By that time an estimated 750,000 had been rendered homeless, and 14 lives had been lost.

A year of labour trouble in Ohio began in Jan. 1937 with strikes at the Libbey-Owens-Ford Glass company and a gas company at Toledo. After minor labour disputes in April at Akron rubber plants, strikes broke out in the steel mills of Canton and Massillon on May 26 and immediately spread to Cleveland, Youngstown and Warren. On June 9, there were riots at the Republic Steel's Bessemer plant in Youngstown. These were followed, June 18, by riots at the plants in Canton. One man was killed and 14 were injured in Youngstown and on June 21, Gov. Davey ordered several companies of the Ohio national guard to Youngstown and Warren. Disorders continued in Canton, culminating in another riot there, July 1. Troops were sent there and later to Cleveland, where further rioting occurred. The series of disorders ended with the riot at Massillon on July 11, 1937, when one person was killed and six others were shot. A few days later, the steel mills in all cities affected by the strikes were preparing to reopen.

The Republican party won all the state offices in the Nov. 1938 election. It captured 15 of the state's 24 seats in the U.S. house of representatives and won the single contest for a seat in the senate. The party also won sizable majorities in both houses of the state general assembly. John W. Bricker (Rep.) received 1,263,678 votes to defeat Charles Sawyer (Dem.), who polled 1,146,695 votes in the race for governor. Others elected to principal offices were: Paul M. Herbert, lieutenant governor; Earl Griffith, secretary of state; Don H. Ebright, treasurer; Thomas J. Herbert, attorney general; Carl V. Weygandt, chief justice of the Ohio supreme court. Robert A. Taft (Rep.) was elected to the U.S. senate. Anti-prohibitionists won the majority of the local option elections. A dispute between Gov. Davey and the Federal Social Security board resulted in the state's losing October federal payment of

\$1,356,756 for old-age pensions. The board charged that there were politics and inefficiency in the state administration of the pensions, and the governor accused the board of playing politics. When the state administration complied with the rules, federal payments were resumed and the state borrowed from its own general fund to make the October payments to the state's 112,000 old-age pensioners.

In the last quarter of 1939, Toledo and Cleveland, industrial centres, found their relief funds at the vanishing point. They appealed to Gov. John W. Bricker to call a special session of the legislature to raise additional funds. The governor refused, holding that the cities had not done everything in their power to remedy the situation. He charged that political manipulation of the Work Projects administration was partly responsible for Cleveland's difficulty and pointed out that at a special election in Toledo a relief levy was defeated, with only 11,622 votes in favour of it although there were 11,204 cases or nearly 33,000 people on relief rolls. The governor's stand and his charges brought heated retorts from President Roosevelt, Secretary of the Interior Harold Ickes and Col. Francis C. Harrington, Work Projects commissioner. By transferring funds intended for other purposes and with temporary help from federal agencies, the cities were able to take care of the most desperate cases of need.

While President Roosevelt won Ohio's electoral votes in the Nov. 1940 election by polling 1,773,139 ballots, to 1,586,773 for Wendell Willkie, Republicans won a majority of the state offices. Governor Bricker was re-elected, defeating former Governor Martin L. Davey. Mayor Harold H. Burton (Rep.) was elected to the U.S. senate. Others elected to principal offices were: Paul M. Herbert (Rep.), lieutenant governor; John E. Sweeney (Dem.), secretary of state; Thomas J. Herbert (Rep.), attorney general; Don H. Ebright (Rep.), treasurer; and Joseph T. Ferguson (Dem.), auditor. George H. Bender (Rep.) and Stephen M. Young (Dem.) were elected congressmen-at-large. Elected to the state supreme court were: Charles B. Zimmerman, Edward C. Turner and Gilbert Bettman. Republicans retained control of both houses of the legislature but only by narrow margins. Democrats gained four house seats in congress to achieve equal representation with the Republicans, each having twelve.

Three important actions were taken by the legislature in June 1940. It voted to separate the presidential and state ballots, a Republican stratagem designed to protect Republican candidates for state and county offices from being overwhelmed by straight-ticket voters in the event of a national landslide. It increased maximum old-age pensions from \$30 a month to \$40 and appropriated an additional \$1,000,000 to provide for applicants for pensions who were then on the waiting list. A third important action was the appropriation of \$1,400,000 for poor relief. This, combined with improved business conditions and an Ohio supreme court ruling of July 17 which validated the law authorizing taxing units to issue bonds against delinquent taxes for poor relief, ended all fear of a repetition of the 1939 relief crisis. By Nov. 23, 1940, Ohio's poor relief load was down to 76,200, the lowest in three years.

The 1941 session of the legislature also passed considerable important legislation. Notable new laws prohibited the sale and use of fireworks except for public display; established a new state guard to replace the national guard, which had been made part of the U.S. army; set up uniform traffic regulations conforming with those of other states; legalized medical service associations; forbade sit-

down strikes; required applicants for marriage licences to produce certificates showing freedom from syphilis; and exempted newspapermen from revealing the source of their information in any legal procedure. As defense industries increased production there was a great demand for labour and a consequent shifting of population. A serious housing shortage resulted in some regions, where it was necessary to set up trailer camps and begin emergency housing construction. The situation was most critical in Ravenna, Sandusky, Akron, Dayton, Warren and Youngstown.

Gov. Bricker was re-elected in Nov. 1942 by the largest majority and with the highest percentage of the total vote ever won by a candidate for governor in Ohio. He was the first Republican governor to be elected for three consecutive terms. The entire Republican state ticket was elected by substantial majorities. Paul M. Herbert, lieutenant governor; Don Ebright, treasurer; and Thomas J. Herbert, attorney general, were returned to office for their third consecutive terms. Edward J. Hummel was elected secretary of state. The only Democrat holding office was Joseph T. Ferguson, auditor, who was in the middle of a four-year term. The Republicans also won overwhelming control of the state legislature. In the 23 congressional contests, only three Democrats survived the Republican landslide. Charles S. Bell was elected to the state supreme court, and Judges Roy H. Williams and Edward C. Turner were re-elected. All ran on the Republican ticket.

The 95th general assembly convened Jan. 4, 1943, and adjourned on June 24. It was one of the longest biennial sessions in the state's history. Among the most important of about 200 bills enacted were measures which approved the highest appropriation bill in the state's history; returned the state to eastern standard time; authorized liquor rationing; relaxed employment regulations for females and minors; levied an unemployment surtax on pay rolls of manufacturers expanded by war production; provided prison terms for operators of the "numbers" gambling racket; permitted the state highway director to keep secret his engineers' estimates of highway costs; increased state subsidies for schools more than \$5,000,000; required the state to relieve counties of the expense of caring for indigent patients in institutions for the feeble-minded; established a postwar planning commission and set aside about \$23,000,000 for a postwar welfare building program; increased 1943-44 old-age pension funds by \$10,000,000; and extended for two years the liquid fuel, cigarette and utility excise taxes. The assembly announced that the state's net surplus was about \$42,000,000. On Nov. 10, Governor Bricker formally announced that he would be a Republican candidate for president in the Ohio primaries, forgoing a bid for a fourth term as governor.

After Thomas E. Dewey won the presidential nomination, Gov. Bricker accepted the party's vice-presidential nomination and made extensive campaign trips in behalf of the Dewey-Bricker ticket. That ticket carried Ohio in the Nov. 7, 1944 election by 11,530 votes, polling 1,582,293 to 1,570,763 for the Roosevelt-Truman ticket. Mayor Frank J. Lausche of Cleveland (Dem.) was elected governor. Robert A. Taft (Rep.) was re-elected U.S. senator. Others elected were: George D. Nye (Dem.), lieutenant governor; Edward J. Hummel (Rep.), secretary of state; Joseph T. Ferguson (Dem.), auditor; Don H. Ebright (Rep.), treasurer; Hugh S. Jenkins (Rep.), attorney general; George H. Bender (Rep.), representative-at-large; Carl V. Weygandt, chief justice of the supreme court and Edward S. Matthias and William L. Hart, supreme court judges. The new general assembly was heavily Republican.

Two special sessions of the general assembly were held

Gov. John W. Bricker of Ohio during the 1944 Republican national convention, Chicago, Ill., in which he withdrew as presidential candidate in favour of Thomas E. Dewey to become the party's vice-presidential nominee

in 1944. The first, April 26-28, passed a law to enable Ohioans in the armed services to vote on all national and state candidates and local issues. The second, Sept. 5-6, approved an additional appropriation of \$8,860,000 for teachers' salaries and other school expenses, and suspended for the Nov. 7 election the requirement that ballots be marked with a black lead pencil. A total of 164,472 Ohioans in service voted in the election.

Gov. Frank J. Lausche (Dem.) took the oath of office Jan. 8, 1945, and announced that there would be no wholesale firing of Republicans from the state pay roll. Among the appointments he made were: John M. Hodson as director of agriculture; Perry T. Ford as director of highways; Herbert D. Defenbacher as finance director; Frazier Reams as director of welfare and James W. Huffman as director of commerce. When U.S. Senator Harold H. Burton was appointed to the U.S. supreme court, Huffman was appointed by Gov. Lausche to replace him in the senate. Robert L. Moulton was then named director of commerce.

Bakery products	105,261	84,325
Petroleum refining	97,298	84,137

The general assembly met in continuous session from Jan. 1, 1945, to July 19. Its outstanding accomplishments were: passage over Gov. Lausche's veto of a bill to increase the state contribution to local school districts; re-enactment of the liquid fuel, cigarette and utility excise taxes; advancement of the primary election and filing dates to enable members of the armed forces to participate in elections; granting of salary increases amounting to about \$5,000,000 a year; and establishing of library survey and code revision commissions. A special session was called

Sept. 5 at which unemployment compensation benefits were increased from a maximum of \$16 a week for 18 weeks to \$21 a week for 22 weeks. The state administration was able to make substantial progress in providing housing for the mentally sick and in adding to and developing state parks and forests.

Thomas J. Herbert, Republican, was elected governor in the election of Nov. 1946, polling 1,166,550 votes to 1,125,997 cast for Gov. Frank J. Lausche, Democrat of Cleveland. Former Governor John W. Bricker, Republican of Columbus, defeated Senator James W. Huffman, Democrat of Columbus, in the race for the United States senate seat, 1,275,774 votes to 947,610. Elected at the same time were: Paul M. Herbert (Rep.) as lieutenant governor, Edward J. Hummel (Rep.) as secretary of state, Don. H. Ebright (Rep.) as treasurer of state, Hugh S. Jenkins (Rep.) as attorney general and George H. Bender (Rep.) as congressman-at-large.

Herbert announced the following appointments before taking office: Chester W. Goble, adjutant general; Frank Farnsworth, agriculture director; Dale Dunifon, commerce director; H. D. Defenbacher, finance director; Murray D. Shaffer, highway director;

Charles L. Sherwood, welfare director; William J. Rogers, industrial relations director.

The general assembly met in special session of June 24, 1946; the principal measures adopted before adjournment on July 8 were those restoring civil service rights to war veterans and appropriating \$5,000,000 for the use of local governments.

The legislature also made additional appropriations of \$4,469,869 for operation of the state universities, \$750,000 for poor relief, \$2,577,420 for operation of the welfare department and \$1,150,000 for construction and improvements of state hospitals.

Okamura, Yasuji

Okamura (1884–), Japanese army officer, was born in May 1884 in Tokyo. After being graduated from the military academy in 1905 he became adviser to Sun Chuang-fang, Chinese military leader of the 1920s. He later became chief of the military research department of the general staff office and vice chief of staff of the Kwantung army. Okamura was behind most of the intrigue which led to the invasion of Manchuria in 1931 and the occupation of that territory, as well as the northern Chinese provinces, in the ensuing years. Named commander in chief of Japanese forces in north China, he replaced Shunroku Hata as commander in chief of all Japanese armies in China on Nov. 22, 1944. On Sept. 9, 1945, Okamura formally surrendered his forces, variously estimated as upward of 1,000,000 men, to Gen. Ho Ying-chin, supreme commander of Chinese ground forces.

O'Kelly, Seán Thomas

O'Kelly (1882–), Irish statesman, was born Aug. 25, 1882, and was educated in the O'Connell schools, Dublin. One of the founders of the Sinn Fein, he was honorary secretary of the organization, 1908-10 and was general secretary of the Gaelic league, 1915-20. He was Republican member of the Dail from the College Green division of Dublin, 1918-24, and was speaker of the first Dail Eireann, 1919-21. O'Kelly was the Irish Republican envoy to the Paris peace conference and pleaded for recognition of Ireland's independence in 1920. He was also envoy to Rome in 1920 and to Washington, 1924-26. In 1927, he was elected to the Dail Eireann for Dublin North and from 1932 to 1939, he was vice-president of the executive council and minister for local government and public health in De Valera's government.

O'Kelly, who was minister of finance and education in De Valera's cabinet, 1939-45, was unanimously selected by the Fianna Fail, the government party, as its candidate in 1945 for the presidency of Eire to succeed Dr. Douglas Hyde. He defeated the opposition candidates and took office June 25, 1945, for a seven-year term.

Okinawa

Okinawa is the largest island and former seat of Japanese administration of the Ryukyu archipelago, a chain of islands located between 24° and 30° N. and 123° and 130° E. The northernmost of the Ryukyus is 80 mi. S. of Kyushu, the southernmost 73 mi. N.E. of Formosa.

The Okinawa Campaign, 1945.—The U.S. drive across the central Pacific to the Japanese home islands had started in the Gilbert Islands and extended by the summer of 1944 through the Marshalls to the Marianas. In the fall of 1944 Adm. Chester W. Nimitz, commander in chief, United States Pacific fleet, was directed by the joint chiefs of staff to occupy Okinawa and other positions in the Nansei Shoto in order to provide bases for supporting the final attack against the Japanese islands. The Nansei Shoto invasion that immediately followed the Iwo Jima campaign in 1945 was the largest amphibious operation of the Pacific war, with more than 1,400 ships involved. Overall command was assigned to the commander of the U.S. 5th fleet, Adm. Raymond A. Spruance. The joint expeditionary force was commanded by Vice-Adm. Richmond Turner, and the expeditionary troops, the U.S. 10th army, by Lieut. Gen. Simon Bolivar Buckner. The 10th army was composed of the 24th army corps and the 3rd marine amphibious corps.

After months of planning, operations began on March 17, 1945, with preliminary naval air and surface strikes against the entire Ryukyu chain, co-ordinated with strategic army air force bombings of the home islands of Japan and other parts of the empire and of Asia, which succeeded in establishing air and naval supremacy in the Nansei

Front line troops in Okinawa stood quietly in the rain to hear the news of victory in Europe, then returned to battle

Shoto. Naval bombardment and fire support groups arrived off Okinawa on March 25, and in conjunction with naval aviation commenced the destruction of the fortifications which constituted the framework of the defenses of Okinawa. A series of operations to confuse and deceive the Japanese and systematically reduce the outlying defenses was conducted prior to the main landings on Okinawa. On Easter Sunday, April 1, 1945, the 10th army landed its two corps, each employing two divisions abreast, on an eight-mi. stretch of beach south of the centre of the west coast of Okinawa. Initial resistance was light, and two airfields were overrun by noon the first day. One army division advanced rapidly across the breadth of the island. The 3rd marine amphibious corps turned north, while the 24th corps compressed Japanese forces in southern Okinawa. By April 21 the 3rd marine amphibious corps had eliminated all resistance in the north and initiated movement southward to join the 24th corps in its task of destroying the Japanese forces which were resisting with fanatical tenacity from elaborate fortifications along a line across the island just north of Shuri. After repeated assaults hindered by heavy rain and mud which complicated supply problems and hampered all movements, the Shuri position was shattered and the remnants of the Japanese 32nd army, originally a force of about 126,000 men, were cornered and destroyed on the southwestern tip of Okinawa. All organized resistance ended on June 21 after 82 days of struggle. Supporting naval units were subjected to repeated bombing and suicide plane (Kamikaze) attacks throughout the course of the land campaign.

The development of Okinawa as a naval and air base proceeded concurrently with the seizure of the island, and by the time of the surrender of the Japanese in Aug. 1945, planes based on Okinawa were bombing the Japanese islands daily, severing their sea and air communications and preparing the way for the final invasion of the homeland. (See also WORLD WAR II.) (R. S. G.)

Oklahoma

A west south-central state, Oklahoma was admitted as the 46th state Nov. 16, 1907. Its popular name "Sooner state" was derived from the term "sooner" applied to those who entered and staked claims sooner than the law allowed when the first public lands were opened by the run for homesteads, April 22, 1889. Area, 69,919 sq. mi., including water surface (265 sq. mi. in artificial lakes). Population (1940) 2,336,434, of which approximately 62% were rural; approximately 87% were white, 7% Negro, 4% Indian, 2% foreign born. On July 1, 1944, the bureau of the census estimated the population of the state at 2,064,679. The two largest cities were Oklahoma City (204,424), the capital, and Tulsa (142,157).

The governor in 1937 was Ernest W. Marland, elected in 1934 to serve for a four-year term. By action of the 16th legislature (1937) the run-off primary was abolished, the candidate with a plurality in the party primary advancing to the general election.

The year 1938 was marked by an unusually stormy July primary campaign climaxed by a visit of Franklin D. Roosevelt. In the Democratic primary for governor, Leon C. Phillips, former speaker of the state house of representatives, barely defeated W. S. Key, former state Works Progress administrator, by a vote of 179,139 to 176,034. William H. (Bill) Murray, former governor, ranked third with a vote of 148,395. In the Democratic primary for U.S. senator, incumbent Elmer Thomas defeated Gomer Smith by

252,550 votes to 190,774. In the Republican primary Ross Rizley and Harry O. Glasser were nominated for governor and U.S. senator, respectively. In the November election, comparatively the quietest after 1918, Phillips defeated Rizley 355,740 votes to 148,861; and Thomas defeated Glasser 307,936 to 159,734. To the other elective offices all Democratic incumbents were returned. With the exception of the 5th district, the incumbent Democratic U.S. representatives were re-elected. Leon C. Phillips was inaugurated Jan. 9, 1939.

The 17th legislature in 1939 remained loyal to the new governor and the session ended with little change in the way of taxation or increased appropriations. The heavy debt of the state had been constantly criticized by the governor and steps were taken in an attempt to bring about a more economical state government. In August the state forced all oil production to cease and for two weeks all wells were shut down. The situation came as a result of similar action taken in Texas and was widely heralded as a price-fixing scheme. However, state officials stoutly maintained that production exceeded the market demand and that the purpose was conservation, since state statutes define any production of oil over market demand as waste. On the educational scene strife developed between the governor and the state department of education over issuance of the \$11,000,000 common school fund. In addition, control of the state teachers colleges was wrested from the state board of education and placed in the hands of a college board of regents. As a result of laws passed by the 17th legislature the so-called teachers colleges were changed to state colleges and in many instances changes were made in the administration of the schools.

Politically, 1940 was comparatively quiet as far as state affairs were concerned. The term of neither senator expired and no important state office was to be filled. In the presidential race Pres. Roosevelt easily won the state's 11 electoral votes with a vote of 474,313 compared with 348,872 for Wendell Willkie. With the exception of the 8th district, all incumbent Democrats were returned to the house of representatives by large majorities. Perhaps the outstanding event of 1940 was the contest between the federal government and Gov. Leon C. Phillips over the flood-control projects in the state. In March the Grand River dam authority ordered the flood gates of a dam in northeastern Oklahoma to be closed, thus flooding acres of farm land and state highways. Gov. Phillips did not feel that the state had been reimbursed properly for the lost highways and attempted to halt the flooding until proper settlement had been made. The governor had called out the national guard and placed the area under martial law before the gates could be closed. However, a federal court order was issued restraining the governor, and the gates were closed before a settlement agreeable to the state was reached.

As 1940 ended the chief interest in Oklahoma was national defense. Plans were being completed for a bombing squadron base for Oklahoma City and an aeroplane assembly plant for Tulsa. In an attempt to thwart any possible fifth column activities several members of the Communist party were indicted by the Oklahoma county grand jury on charges of criminal syndicalism under a law passed during World War I. By the end of 1940 two of the accused had been convicted and sentenced to ten years in prison.

Shocks of wheat gathered on a grain field in Oklahoma. Oklahoma's abundant contributions of wheat and oil were representative of the natural wealth which helped to insure victory for the Allies in World War II

The adoption, at a special election on March 11, 1941, of a constitutional amendment sponsored by Gov. Phillips, provided for the financing of the state government. This amendment required the state to operate with a balanced budget by making unlawful any appropriations or expenditures in excess of current income. Since the state's revenue could not be secured from ad valorem taxes—the income from these going to local units—the state legislature found it necessary to increase the revenue from various tax sources to maintain the functions of government and to pay off the debt resulting from the deficits piled up from 1930 to 1940. As a result of the new levies and the rise in prices and volume of business, revenues during the first quarter of the fiscal year 1941-42 were \$4,000,000 more than those of the preceding year. Two other constitutional amendments were adopted at the March election. The first made possible more liberal old-age pensions. The second established a nine-member board of state regents for higher education, to co-ordinate all state educational institutions. Under Gov. Phillips in 1941 were the following other state officers: James E. Berry, lieutenant governor; C. C. Childers, secretary of state; Frank C. Carter, auditor; Mac Q. Williamson, attorney general; Carl B. Sebring, state treasurer.

Perhaps the most important development of 1942 was the adoption in November of a constitutional amendment making women eligible for election to all state offices. Another constitutional amendment was adopted in July authorizing the legislature to provide for retirement pensions for teachers.

The fiscal year 1941-42 ended with a large surplus and tax collections indicated a surplus for the fiscal year 1942-43.

(R. GTR.; X.)

The administration of Gov. Phillips ended with the beginning of 1943. At the Nov. 1942 election the following officers were elected for four-year terms: Robert S. Kerr, governor; James E. Berry, lieutenant governor; Frank C. Carter, secretary of state; C. C. Childers, auditor; A. S. J. Shaw, treasurer; Mac Q. Williamson, attorney general; A. L. Crable, superintendent of public instruction; John Rogers, state examiner and inspector; W. A. Pat Murphy, commissioner of labour; Mabel Bassett, commissioner of charities and corrections; Jess G. Read, commissioner of insurance; Robert H. Brown, chief mine inspector; Joe C. Scott, president of state board of agriculture.

In the elections, Nov. 1944, the total vote cast for presidential electors was 722,636, the Democrats carrying the state by a plurality over the Republicans of 82,125. Elmer Thomas (Dem.) was re-elected U.S. senator. Representatives in congress, six Democrats, two Republicans. Mac Q. Williamson, attorney general, resigned to enter the armed forces and Randall S. Cobb was appointed to succeed him.

Ontario

With 412,582 sq.mi. of territory, Ontario is Canada's second largest province and is 17,000 sq.mi. greater than France and Germany combined. Of its total 12%, or 49,300 sq.mi., is fresh water. Although an inland province it has 680 mi. of ocean shore line along Hudson and James bays in the north, and 2,362 mi. of fresh-water shore line along the Great Lakes in the south.

During the 1937-46 decade the province's population increased notably and there was a slight but significant modification in its composition. Though only fourth in density, Ontario had more people than any other Canadian province. The figures are: (1931) 3,431,683; (1941) 3,787,655; (1946 est. by the dominion bureau of statistics) 4,004,000. Population centres in 1941 were: the capital, Toronto (667,457); Hamilton (166,337); Ottawa (154,951); Windsor (105,311) and some smaller cities. All of these grew at twice as fast a rate as the rural areas, especially during World War II when industrial activities required concentrations of population.

Lieutenant governors in office during the decade were: Col. H. A. Bruce (Oct. 25, 1932-Nov. 23, 1937); Albert Matthews (after Nov. 23, 1937). Premiers were: Mitchell F. Hepburn (July 10, 1934-Oct. 21, 1942); G. D. Conant (Oct. 21, 1942-May 18, 1943); H. C. Nixon (May 18, 1943-Aug. 17, 1943); Col. George A. Drew (after Aug. 17, 1943).

At the beginning of the 1937-46 decade Ontario had 33% of Canada's population, 50% of its mineral wealth and was capable of producing 50% of its manufactures. About 45% of the dominion's national income went to Ontario. These economic facts made the political history of Ontario during the decade especially significant.

After nearly 40 years of Liberal administrations, from its creation as a province in 1867 to 1905, Ontario experienced first an upsurge of conservatism (1905-19) and then a flurry of agrarianism (1919-23). In the latter year the Conservatives were returned to power and held office, under two premiers, until 1934. Then Mitchell Hepburn led the Liberals back to office, beginning a ten-year Liberal regime marked chiefly by sound financing. Other Liberal legislation during the 1934-43 period included expansion of the province's social services, compulsory pasteurization of milk, venereal disease control and compulsory recognition of the bargaining agencies among workers. The police courts of the province were reorganized and stipendiary magistrates introduced. A spirited battle took place with the large power interests and a significant reduction in electrical rates resulted. The provincial hydroelectric system was extended widely to include 821 municipalities and many rural areas got electricity for the first time. Uniform insurance laws were enacted. This reform legislation was important because it affected the lives of all the people.

Actual political events, in terms of elections, threw some light on trends of political thought during the period. In 1934 the Liberals had dominated the scene with 66 seats, with the Conservatives retaining only 17, the Co-operative

Commonwealth Federation (C.C.F.), making its first bid for provincial power, winning only 1 and independents taking the remaining 6. Three years later the Liberals retained power with 63 seats, the Conservatives started their road back with 23 seats, while the C.C.F. was routed. The other four seats went to independents. In 1942 there was a brief political skirmish when the Liberals extended the life of the legislature a year beyond its legal limit of five years, which may have indicated a feeling that public support was waning. At any rate, after two switches in premiers the Liberals finally went to the country in 1943 and were severely beaten. They retained only 15 seats, the Conservatives climbed to 38, the C.C.F. staged a surprising comeback by winning 34 seats and there were 3 independents.

After the election the Conservatives and the Liberals toyed with the idea of joining forces but rejected the notion, while the C.C.F. resolutely refused to have anything to do with either of the older parties. Col. George A. Drew, Conservative leader commanding the largest single block of seats, was, therefore, called on to form a government; he succeeded, by careful manoeuvring, in avoiding introduction of legislation which would draw the combined opposition of the Liberals and the C.C.F., and retained office until 1945. A sudden decision to appeal to the people resulted in a sweeping victory for the Conservative forces. They won 66 seats, the Liberals were reduced to a corporal's guard of 11, the C.C.F. was greatly eclipsed and held only 8 of the seats won in 1943 and there were 5 independents.

Part of the reason for the great swing in the 1945 return was perhaps a desire by the electorate to achieve stable government. There was another factor, however. In the brief period 1943-45 the Conservatives indicated they were prepared to introduce and enforce major reforms, and this attracted public support. Chief among these reforms was the setting up of a department of planning and development with divisions of conservation, town and community planning and trade and industry promotion. Conservation took jurisdiction over all natural resources except coal, oil, gas and minerals; town and community planning gave aid in problems of growth and administration; trade and industry promoted industrial engineering and fostered postwar trade with foreign countries (Ontario house was re-established in London, England, in 1944). In 1945 the government announced a \$192,000,000 road-building program to be completed by 1950. Important legislation of 1946 was the Minimum Wage act for men and the establishment of a Farm Products and Grades act which set up minimum requirements for farm produce.

It is interesting to consider Ontario's abundant natural resources—such as having 54% of Canada's copper, 60% of its gold, 100% of its nickel—against this lively political background. The province advanced economically throughout the period. Already the foremost industrially, its industry received further impetus from the requirements of World War II. On every hand investment in factories and equipment increased; the number of workers, the total amount of money received in wages and the gross value of the goods produced expanded amazingly. In the single year of 1944 Ontario's industry used 12,000,000,000 kw.hr. of electrical energy, with the demand so great on the developed hydroelectric sites that amusement and non-essential uses of power had to be curtailed.

As the largest single mineral producer among the

Canadian provinces, Ontario contributed notably to the nation's war effort. Essential nickel, copper, zinc, magnesium, dolomite, gypsum, silver, platinum, iron ore poured in vast volume from the rich pre-Cambrian belt of the province. There were some spectacular developments. The need for war-vital pig iron led to the diversion of a river, the draining of Steep Rock lake in the northwest and open-pit mining of high-grade hematite iron ore. A railroad had to be built, huge automatic ore-loading docks erected at the head of Lake Superior and other large-scale developments undertaken. Recognizing the increasing importance of mining, the government in 1945 set up an Institute of Mines at Haileybury, Ontario, and thus provided for the first time a technical school for the mining industry.

Expansion of the pulp and paper industry in the northern areas involved large construction projects, such as the building during 1945-46 of new mills and new towns at Red Rock and Blind River.

With the close of World War II Ontario, which had

reaped its industrial harvest of expansion and new wealth during the fighting, was the first province to face difficult industrial problems arising out of the conversion of industry from war to peace. Strikes in key industries, such as shipping and steel, paralyzed other industrial output, and dislocations were widespread. Agriculture, however, because of postwar food requirements both in Canada and abroad, more than held the gains it had made during the war, and continuing wartime shortages of farm help were successfully offset by using the wartime tactics of encouraging urban dwellers to spend their holidays on farms and operating fruit-belt farm camps for boys and girls.

During the 1937-46 decade Ontario maintained its lead as the wealthiest province, its population driving more cars, listening to more radios and using more phones than any other province. The per capita share of the national income moved from \$540 in 1936 to \$824 in 1944, which was direct evidence of the profound impact of World War II on Ontario.

Oppenheimer, J. Robert

Oppenheimer (1904-), U.S. scientist, was born April 22, 1904, in New York city. He was graduated from Harvard university, Cambridge, Mass., in 1925, and later studied at Cambridge university, and at Goettingen university, Germany. He became professor of physics at the Uni-

versity of California in Berkeley, and at the California Institute of Technology in Pasadena in 1929. During World War II the U.S. government placed Dr. Oppenheimer in charge of a special laboratory for the development and construction of the atomic bomb at Los Alamos, 20 mi. from Santa Fe, N.M. Henry L. Stimson, then secretary of war, declared in his statement of Aug. 6, 1945, that the development of the bomb itself was "largely due to his (Dr. Oppenheimer's) genius." In addition to his duties as chief of the atomic bomb laboratory, he was a member of a four-man advisory group of leading U.S. scientists that worked with a government interim committee on the establishment of postwar organizations to direct and control the use of atomic energy; this committee drafted the May-Johnson bill providing for the strict domestic control of atomic energy. In April 1946 Dr. Oppenheimer returned to his post at the University of California.

Oregon

A Pacific northwest state of the United States, Oregon was admitted to the union Feb. 14, 1859, the 33rd state. Area, 96,981 sq.mi., including 631 sq.mi. of water. Population (1940) 1,089,684. On July 1, 1944, the bureau of the census estimated the population of the state at 1,214,226. Capital, Salem (1940 census), (30,908); chief city, Portland (305,394).

The normally Republican state legislature was in Democratic hands at the beginning of the decade 1937-46. The legislature concerned itself primarily with stricter hunting and fishing laws; with forwarding the state building program; with attempting to meet the requirements of the Roosevelt social security program. The state was in a favourable position, except that the jurisdictional difficulties of the American Federation of Labor and the Congress of Industrial Organizations had closed many logging camps and lumber mills and some industries. The state's chief officers in 1937 were: governor, Charles H. Martin; secretary of state, Earl Snell; treasurer, Rufus C. Holman; attorney general, I. H. Van Winkle; superintendent of public instruction, Rex Putnam; and chief justice, Henry J. Bean.

The year 1938 opened with the labour situation greatly improved. Vigorous action by Gov. Martin and by Mayor Joseph K. Carson of Portland and by the law enforcement groups at their command had resulted in the arrest and trial of many "goon" squad leaders. The trial and sentencing of the leaders in the violence, however, while it restored order, had a strong reaction politically. The legislature did not meet during 1938; so this reaction centred around the primaries in May and the general election in November. Gov. Martin, who had incurred the ill will of much of organized labour, was defeated in the primaries by Henry L. Hess, whom labour viewed more kindly. Willis E. Mahoney, who also had the favour of labour, won the Democratic nomination for the U.S. senate. This difficulty, combined with the general Republican resurgence, gave the Republicans practically a clean sweep of the state in the November elections. Charles A. Sprague, Salem newspaper publisher, defeated Hess for the governorship by 55,318 votes. At this election the state passed, by initiative, a measure regulating picketing by unions and laying other restrictions upon them. Organized labour

throughout the country was united in its determination to fight the measure through the courts.

Labour peace was established in Oregon in 1939. The so-called anti-picketing law went into effect. The law prohibited picketing where less than 50% of the employees were involved. As the year ended the A.F.L. was trying out an experiment—using a large "unfair" headline on its own publication and having the paper offered for sale in front of any establishment where there was difficulty. This was held to be the sale of a newspaper rather than picketing, despite the obvious intent of the displayed headline.

The legislature moved into the capitol in Jan. 1939 after a regular and a special session in the Salem armory because of fire in 1935. The lawmakers did little, making minor changes in the income tax. Again they rejected all attempts at a sales tax, voted down repeatedly by the people of the state.

In the presidential election of 1940, Franklin D. Roosevelt received 258,415 votes as against Wendell L. Willkie's 219,555. A Republican state treasurer, Leslie M. Scott, was elected, as was a Republican attorney general, I. H. Van Winkle. Three new representatives were elected to congress: two Republicans, James W. Mott and Homer D. Angell, and one Democrat, Walter M. Pierce. The year 1940 saw Oregon making progress industrially; new manufacturing plants had been attracted by cheap power provided by the federal Bonneville power administration and private electric plants and to increased production demanded by the rearmament program. At the year's end the state's chief industry, lumbering, was employing the greatest number of workers in its history. Established plants were operating night and day and many new, small sawmills were getting into operation. The plywood branch of the industry expanded greatly during the year.

The state's financial situation being favourable, the legislature left taxation approximately as at the beginning of 1941. This restraint proved wise as the year advanced, for the income tax and unexpected inheritance taxes piled up a surplus. Under existing constitutional limitations the money could not be spent. As far as the defense program was concerned Oregon's chief contributions in 1941 were shipbuilding and expansion of lumber production to meet the nation's construction needs. At the end of 1941 there were many thousands of persons at work in the Portland shipyards.

(P. H. P.; K.)

In the Nov. 1942 election Oregon took a leading position in the return to the Republican party. Republican congressional, state and legislative tickets were almost all successful, in some cases by record-breaking pluralities. Earl Snell, Republican, was elected governor. Oregon's contribution to the war effort continued to be largely in shipbuilding and lumber production. The Portland area, including Vancouver, Wash., became the centre of a highly organized ship-construction program, producing a variety of vessels in many different yards. The U.S. Maritime commission announced that the Oregon Shipbuilding corporation, operated by Henry J. Kaiser, held the record for 1942 by turning over to the commission 113 completed Liberty ships. Two large army camps were put into service in 1942 and another the following year.

Oregon was the second state of the continental United States to be attacked in World War II and the first to be bombed from the air. On June 21, 1942, several explosive shells were fired from the sea, presumably from a Japanese submarine. They landed south of the mouth of the Colum-

bia river in the northwest part of the state. On Sept. 9 a very small plane was seen flying eastward in the vicinity of Brookings and shortly thereafter explosions were heard and some bomb fragments and incendiary material were found. The plane was apparently based on a Japanese submarine.

The legislature met in Jan. 1943. Total appropriations for the biennium of 1943-45 amounted to \$23,723,365, an increase of about \$2,800,000 over the previous biennium. An act was passed providing for a reduction in the state personal income tax rates. Late in 1943 the tax commission announced that the rate applicable for the 1943 tax would be reduced by 75%. The legislature also referred a sales tax proposal to a popular vote to be held at the general election in Nov. 1944. The year 1943 was Oregon's centennial year for the first large immigration over the Oregon trail in 1843. Public and civic organizations of Portland subscribed a fund of \$100,000 and employed Robert Moses of New York city to investigate Portland's postwar problems. Moses and his staff presented a detailed plan calling for the expenditure of \$75,000,000 for postwar projects, most of them designed to improve local traffic conditions.

Oregon: Statistical Data
Table I.—Education (Public)

	1936	1938	1940	1941	1942	1944

Sand and gravel	1,075	927	1,233	860
Stone	1,443	2,025	1,682	2,235

On Nov. 7, 1944, Oregon, traditionally Republican, gave the Democratic electors a total of 248,635 votes and cast 225,365 for the Republican ticket. The Roosevelt-Truman plurality was 23,270. At the same time voters returned a complete Republican congressional delegation, including Wayne L. Morse and Guy Cordon as senators for the six- and four-year terms, respectively. The four representatives re-elected were James W. Mott, Lowell Stockman, Homer D. Angell and Harris Ellsworth. Republicans were generally elected to other positions, including a majority of the posts for the state legislature. At the November election a bill for a sales tax, submitted to popular vote, was defeated. A modified form of the Townsend plan was also defeated. A legislative act to return the sale of fortified wines to the state liquor stores was approved by the people. The budget for the biennium beginning July 1, 1945, was prepared for the 1945 legislature, calling for an expenditure of \$26,777,500 for the administration and operation of state activities supported by the general fund. It was planned to finance the budget without a state property tax, sufficient funds being available for budget requirements. The tax commissioner announced that the rate applicable to the 1944 personal income tax would be 70% of par, or a discount of 30%.

The 1945 session of the legislature appropriated \$40,616,150 as compared with \$24,164,706 in 1943. The increase was mainly for new buildings, improvements at state institutions and for the state system of higher education. At a special election on June 22 voters ratified the acts concerned with these buildings and improvements, but a bill to levy taxes on cigarettes failed of popular support. The state highway commission tentatively adopted a three-year highway construction program calling for an expenditure of \$35,000,000. In addition a federal program was adopted, calling for about \$5,000,000 for forest highways and similar roads on federal lands in the state.

Toward the end of 1945 a large part of the lumber industry in Oregon was stopped by strikes. In July and August there were unusually severe forest fires in the Tillamook burn area, the scene of a devastating fire in 1933. The 6 major shipyards in the Portland area produced 232 seagoing ships in 1945. After the end of hostilities ship production was greatly reduced, and in December it was estimated that there were fewer than 25,000 people working in Oregon yards. During the 4-year war construction period 1,174 ocean vessels were built in Portland and vicinity with total payroll outlays of \$1,088,000,000. In 1945 it was announced that Portland had been the principal shipping port for lend-lease goods to the U.S.S.R. and that cargo valued at about \$750,000,000 had moved out in this activity.

On May 5, 1945, a party of picnickers discovered a contrivance which turned out to be a Japanese bomb carried into the country by a balloon. It exploded, killing one woman and five children, the only known casualties by axis attack in the continental United States during World

The Oregon state capitol building at Salem was designed in modernized Greek architecture and completed in 1939. The statue of a pioneer, rising 40 ft. above the tower, was executed in bronze by Ulric H. Ellerhausen

War II. On Nov. 12 James W. Mott (Rep.), congressional representative from 1933, died after a short illness. At a special election held on Jan. 11, 1946, Walter A. Norblad (Rep.) was elected to succeed him.

At the election on Nov. 5, 1946, Oregon elected Republican candidates by almost a clean sweep. Governor Earl Snell and Secretary of State Robert S. Farrell, Jr., were re-elected by large majorities. Four Republican representatives in congress were also re-elected; the new state senate and house of representatives were predominantly Republican. By popular vote, an amendment to the state constitution was adopted revoking a provision of 1859 which prohibited Chinese from holding Oregon real estate. (L. A. Mc. A.; X.)

Ortiz, Roberto M.

Ortiz (1886–1942), Argentine president, was born Sept. 24, 1886, in Buenos Aires. While a student at the University of Buenos Aires he joined the Radical party, then under the leadership of Hipolito Irigoyen. He was a member of the city council of Buenos Aires, 1918–20, sat in the chamber of deputies, 1920–24, and was minister of public works, 1925–28. Following the split of the Radical party, he joined the Anti-Personalist faction led by former Pres. Marcelo Alvear, under whom he held a cabinet post.

Ortiz was finance minister in the Justo cabinet from 1935 to 1937, when he was elected president of Argentina. He launched his country upon a policy of democracy and a continuation of its friendship with the United States. Owing to ill health and approaching blindness, Ortiz temporarily gave up his duties of office in July 1940 and resigned from the presidency in June 1942. He died the following month (July 15, 1942) in Buenos Aires.

Oslo

The capital of Norway, known for 300 years under the name of Christiania, Oslo resumed its ancient name in 1924. Situated at the head of Oslo fjord, it has long been one of Scandinavia's leading seaports. At the 1937 census its population numbered 272,496; in 1943, this figure had fallen to 265,600 (est.). The population of the adjoining suburb of Aker numbered 130,000 (est.) in 1946. Although the foundation of the town goes back to the 11th century, it was, in 1946, essentially a modern town, its new town hall and its university being remarkable for their murals and decorations.

The Germans occupied Oslo on April 9, 1940. Airborne troops were the first to enter the city following the bombing of Kjeller airfield and Akershus fortress. Further troops arrived by sea after the outer defenses in Oslo fjord had been forced by the German navy. In the fighting the German cruiser "Blücher" was sunk. German and quisling headquarters were set up in Oslo, the royal palace and the parliament building being used as offices. In Sept. 1940, the first executions of Norwegian patriots occurred in Oslo, and these increased in number as the occupation proceeded. Sabotage increased correspondingly. In

one night of Dec. 1944, 53,000 tons of ships were damaged or sunk, and in March 1945 the headquarters of the railway administration were blown up. The Germans took mass action against patriots, including the arrest and deportation of all the students of Oslo university. After the Germans had announced their capitulation on May 8, 1945, Norwegian home forces took control. Constant celebrations marked the next few months, with the return home of king and government. In most respects, conditions in Oslo rapidly returned to normal. Housing, however, remained an acute problem, Oslo being, at the end of World War II, short of 15,000 homes. To overcome this shortage, the municipality launched extensive building schemes. (H. K. L.)

Osmeña, Sergio

Osmeña (1878–), Philippine statesman, studied at the University of Santo Tomas, P.I., and was admitted to the bar in 1903. After serving in various positions of importance in the island government and on Philippine independence missions to the United States he became vice-president of the Philippines commonwealth in 1935 and was re-elected to this post in 1942. Osmeña fled in Feb. 1942 when Japanese forces were overrunning the country, and followed Pres. Manuel Quezon to Washington, where the latter set up a government-in-exile. After the death of Quezon, Osmeña was sworn in as president of the commonwealth on Aug. 1, 1944. Immediately after U.S. troops invaded Leyte Island on Oct. 20, 1944, Osmeña stepped ashore and subsequently established his provisional headquarters at Tacloban. Continuing as president after the liberation, he was nominated for this office by the Nationalist party but was defeated by Manuel A. Roxas in the elections held on Apr. 23, 1946.

Osteopathy

Research in the osteopathic concept of disease advanced steadily in osteopathic colleges and other centres during the decade 1937–46, but progress was slow because of World War II and the resultant lack of personnel and finances. Notable among research projects were those by Dr. J. S. Denslow and associates of the Still Memorial Research Trust, Kirksville, Mo., in the fields of electromyography (electrical currents in muscle), reflexes in the spinal cord of man and in the dynamics of the human skeletal system.

In 1938 Frederick A. Long and Paul T. Lloyd published their monograph, "The Use of the Roentgen Ray in the Study of Vertebral Mechanics with Special Reference to Its Adaptation in Osteopathic Procedure," based on research work done at the Philadelphia College of Osteopathy.

Low-back pain and its causes were studied continually at the clinic of the Chicago College of Osteopathy, where a special technique for taking X-ray pictures of patients in the standing position was developed. A difference in leg lengths was noted in 91% of the first 150 cases studied.

Another important research project started previous to

the war in the Institute of Animal Genetics of Edinburgh university, Scotland, concerned the effects of mechanically induced lesions of the lumbar spinal joints on the ovaries of rats. A report, published in *The Journal of Osteopathy* (Kirksville, Mo.), Feb. 1937, indicated that such structural disturbances affect normal gestation time and fertility of rats.

Early in the decade, the six approved colleges of osteopathy, located in Chicago, Des Moines, Kansas City and Kirksville, Mo., Los Angeles and Philadelphia, began requiring for entrance a minimum of two standard years of successful preosteopathic study, including specified basic science subjects, in an accredited university or liberal arts college. The standard minimum curriculum in osteopathic colleges for the professional course continued to require at least 4,000 hours through the standard four college years.

The decade was marked by increased recognition on the part of both the U.S. congress and many state legislatures of the educational qualifications of osteopathic physicians and surgeons for the complete practice of the healing art. The U.S. congress on May 31, 1938, amended the U.S. Workmen's Compensation act to authorize specifically payment by the government to osteopathic physicians and surgeons and in osteopathic hospitals, for the care of government employees sick or injured in line of duty.

Despite specific deferment directives from Selective Service, approximately 575 osteopathic students and physicians enlisted or were inducted in the armed forces. Many of these served in hospital corps or in administrative capacities in the medical corps.

An army appropriation bill, approved June 30, 1941, included a provision for the employment by the medical corps of osteopathic physicians as interns in army hospitals. The same provision was included annually as long as hostilities continued, but the surgeon general of the army failed to appoint any doctors of osteopathy as interns.

Throughout the war, navy appropriation bills included funds for the payment of osteopathic physicians as commissioned officers in the navy medical corps, beginning with the one approved Oct. 26, 1942, but the surgeon general of the navy failed to commission any doctor of osteopathy. By virtue of a law, enacted Aug. 2, 1946, the president of the United States was authorized to appoint graduates of approved osteopathic colleges as commissioned medical officers in the navy.

When congress appropriated funds for the obstetrical care of servicemen's wives, a specific provision included osteopathic physicians among doctors to be paid by the government. Thousands of servicemen's wives were delivered by osteopathic doctors participating in this plan. A law relating to the U.S. public health service, approved July 1, 1944, made osteopathic physicians eligible for appointment as reserve officers, and some were so appointed. The Veterans' administration authorized osteopathic hospitals to treat veterans with service-connected disabilities in emergencies.

Under the provisions of a law approved Aug. 8, 1946, federal departments and agencies were authorized to establish health service programs, with osteopathic physicians expressly eligible to render the professional services involved. In addition, the United States Civil Service commission adopted a ruling to accept medical certificates executed by licensed doctors of osteopathy under the same conditions as those accepted from other private physicians.

While great strides were being made in the recognition accorded the osteopathic school of practice by the U.S.

government, several state legislatures also were amending or completely rewriting their medical practice acts to increase the scope of practice of osteopathic physicians and surgeons commensurate with their education. The following states were added to the list of those giving full practice rights, including the use of major surgery and narcotics and other drugs, to qualified doctors of osteopathy: Indiana, Nebraska, New Jersey, New York and Ohio. Doctors of osteopathy were now qualified to practise major or other forms of surgery under the laws of 42 states and territories. In a similar number of states they could use drugs.

The 1946 Directory of the American Osteopathic association listed 11,175 osteopathic physicians, surgeons and specialists in the United States, Canada, the British Isles, the European continent, South America, India, China and other parts of the world. This represented a gain of 2,184 during the decade. Membership in the American Osteopathic association was 7,852 or 70%.

During the decade, the number of students in the six approved colleges of osteopathy varied from 1,977 before the war to 556 during the war. To give the best possible training under curricular requirements, the total number of students was limited to 1,500.

Expansion programs to increase the faculties and facilities of osteopathic colleges and their associated hospitals began in 1942. The osteopathic profession contributed more than \$1,000,000 to the support of its colleges. In 1946 there was an acceleration of the campaign for funds with a five-year goal of \$7,500,000.

In 10 years the number of osteopathic hospitals and clinics had increased from 260 to more than 300. In 1936, only 18 were approved for the teaching of interns by the American Osteopathic association and the American College of Osteopathic Surgeons, jointly. At the end of 1946, there were 58 hospitals approved for intern-training following rigid annual inspection, and 129 hospitals on the registered list. The intern-training and registered hospitals had a total of 5,489 beds and 1,383 bassinets.

Osubka-Morawski, Edward Boleslaw

Osubka-Morawski (1904?-), Polish government official, was a member of the Polish Socialist party before the outbreak of World War II. He had been associated with the Warsaw housing co-operative and was active, although not widely known, in the co-operative movement. In 1943 Osubka-Morawski left the Socialist party to join a more leftist faction, the Polish Socialist Workers party; he published an underground paper during the German occu-

pation. Later he left for Moscow and on July 23, 1944, he became head of the Polish Committee of National Liberation, to administer the areas of land freed by the Red army. He was selected as premier of the Polish provisional government in Dec. 1944 and was retained in that post in the permanent government formally installed in Warsaw on June 28, 1945. Known as an advocate of government ownership of all industry of national importance, he was also committed to the abolition of all large estates in Poland, except for land owned by the church. Osobka-Morawski, approved by and sympathetic toward the soviet union, frequently came into conflict with his democratic vice-premier, Stanislaw Mikolajczyk, during 1945 and 1946.

Ottawa

First settled in 1800, called Bytown in 1827, incorporated as a city and renamed Ottawa in 1854 and designated capital of Canada in 1857, Ottawa, Ont., in 1946 covered 8.3 sq.mi. of land surrounding the confluence of the Ottawa and Rideau rivers. It is 120 mi. west of Montreal, Que., and 290 mi. northeast of Toronto, Ont.

During the 1937-46 decade the population of the city itself and of the area known as Greater Ottawa (comprising the surrounding townships and the city of Hull in Quebec across the Ottawa river) increased at more than twice the average Canadian rate. The figures were as follows: (1931) 126,872, (1941) 154,951, (1945) 195,223; Greater Ottawa (1931) 175,988, (1941) 215,022, (1945) 224,826. In 1941 the population was 60% British and 31% French and was almost evenly divided Protestant and Roman Catholic.

The outstanding effect of World War II on Ottawa was the enormous expansion of the civil service population to handle the special war-needed government departments—munitions and supply, national war services, army, air services, naval services and, toward the end of the war, reconstruction, veterans' affairs, health and welfare.

Although there was some permanent building prior to the outbreak of war—the new Supreme Court, for example—most of the wartime building consisted of utilitarian wooden structures, called "temporaries," to house the government's new departments.

There was some increase of wartime industrial activity within the city. The 203 factories listed in 1937 increased to 212 by 1945, the 6,000 employees almost doubled and the value of production went from \$21,000,000 to more than \$53,000,000. Trans-Canada Air Lines made Ottawa a port of call in 1937, and in 1946 Colonial Air Lines established direct service to Washington, D.C.

King George VI and Queen Elizabeth attended parliament May 19, 1939, when for the first time in Canadian history royal assent in person was given to bills. The king unveiled World War I memorial on Connaught circle. Other visitors to the city during the decade were: 1941, Winston Churchill; 1943, Madame Chiang Kai-shek, Franklin D. Roosevelt; 1944, John Curtin, Charles de Gaulle; 1945, Jan Christiaan Smuts; 1946, Dwight D. Eisenhower, Bernard Montgomery.

During the decade many new foreign legations and embassies were established, including those of the Netherlands, Brazil, Argentina, China, Poland, Yugoslavia, Czechoslovakia, Chile, U.S.S.R., Turkey and Mexico. High commission offices were opened by Eire, Australia and New Zealand. Ottawa grew as a diplomatic centre.

In 1946 the federal government projected the develop-

ment of Ottawa and a large block of surrounding land into a district designated as a national memorial to Canada's World War II dead. The government consulted Jacques Greber, noted French city planner, included Hull and Quebec's beautiful 16,000-ac. Gatineau park in the plan, gave expropriation notice to industries adjacent to Chaudière falls and voted \$3,000,000 for the first part of the memorial proposals.

Oxford Group

The Oxford group, already recognized in 1937 for its attempt to inspire "a Christian revolution for remaking the world," and active in 60 countries, articulated its world philosophy in 1938 when its initiator, Dr. Frank N. D. Buchman, launched the program of Moral Rearmament (M.R.A.) in East Ham, London.

From 1938 to 1946 M.R.A. sought to become the ideological spear point of Christian democracy, proposing a program of sound homes, teamwork in industry and national unity.

Condemned by the gestapo, who described M.R.A. as the "pace-maker of Anglo-American diplomacy" and as supplying "the Christian religious garment for world democratic aims," group leaders in occupied countries served in resistance movements. Fredrik Ramm, Norwegian editor, died after two years in a concentration camp. Men trained in M.R.A. served on every battle front.

On the industrial front the M.R.A. program was welcomed by Pres. Truman. He described *The Forgotten Factor*, one of the dramatizations of M.R.A. used in the U.S., Canada, Great Britain and the British empire, as "the most important play produced by the war." John R. Steelman, special assistant to the president, called M.R.A. "the most effective single force for industrial conciliation in the country."

Over 5,000,000 copies of Oxford group books were distributed during World War II in Great Britain alone.

Moral Rearmament was defined by Buchman as "the answering ideology, the overarching philosophy that will answer global selfishness, fear and greed, and unite the world."

Paasikivi, Juho Kusti

Paasikivi (1870-), Finnish statesman, was born Nov. 27, 1870, at Tampere, Finland. He studied law at Finnish, Swedish and German universities, was a law instructor in Helsinki university, 1899-1902, and then went into the banking and insurance business. In 1907, he entered politics as a member of the Finnish diet and the following year he became minister of finance in the semi-autonomous government of the grand duchy of Finland. After the Russian revolution and Finland's declaration of independence, Paasikivi headed the Finnish delegation that signed the treaty of Dorpat on Oct. 14, 1920; this action ended Finland's first war with the soviet union and

established its existence as an independent nation.

During Soviet-Finnish negotiations in 1939, Paasikivi was recalled from his post as Finnish minister to Stockholm to head another Finnish delegation which sought to negotiate a peaceful settlement of the soviet union's territorial demands. His mission ended in failure, however, and the following month, soviet troops invaded Finland, touching off the Russo-Finnish war of 1939-40. After the end of this "winter war," Paasikivi again headed a Finnish peace delegation that went to Moscow and there signed the peace of March 13, 1940. He was subsequently appointed Finnish minister to Moscow, staying at his post until Finland joined the Germans in the axis invasion of the U.S.S.R. that started June 22, 1941. For the following three years, Paasikivi was virtually retired from politics, but on the defeat of his country, he was called back in Nov. 1944, this time as prime minister, because Paasikivi was then considered the only statesman able to negotiate with the soviet diplomats. Following Baron Carl Gustav von Mannerheim's retirement as president of Finland Paasikivi was elected his successor, on March 9, 1946.

Pacific Islands, British

Under this heading are described the British crown island colonies and native protectorates in the Pacific.

Fiji.—Crown colony, comprising all islands, rocks and reefs lying 18° S. and 178° E. There are about 250 islands, 80 inhabited. Area: 7,083 sq.mi.; pop. (est. 1937) 205,397, (est. 1940) 220,787, (est. 1945) 254,676 including 5,277 Europeans, 115,724 Fijians, 117,256 Indians, 2,490 Chinese, 5,909 persons of mixed European and native descent, 3,432 Rotumans, 3,146 Polynesians and 1,442 others. Chief towns: Suva on Viti Levu (cap., pop. 15,522 in 1936). Religion: Christian: Methodist 93,577; Roman Catholic 20,005 (1943). Governors of Fiji and high commissioners of the western Pacific: Sir Arthur F. Richards, (1936-June 26, 1938); Sir Harry C. Luke, (June 26, 1938-June 16, 1942); Major General Sir Philip E. Mitchell (June 16, 1942-Oct. 12, 1944); Sir Alexander Grantham (after Oct. 12, 1944).

A new constitution based upon letters patent issued by the British government on April 2, 1937, became effective on the dissolution of the old legislative council on June 13, 1937. The old semirepresentative system was abolished and a purely nominative system substituted. The colony was henceforward administered by the governor assisted by an executive council comprising the governor and five official members and two unofficial members nominated by the governor. The legislative council consisted of the governor and 16 official members, plus five Europeans (three elected and two nominated), five Fijians (nominated), and five Indians (three elected and two nominated). The European and Indian population was directly controlled by the governor's administration, though in each of the 11 Indian districts there was an Indian advisory committee with considerable authority. The Fijians enjoyed a fair measure of local self-government under a system of village and district councils, which was extended in 1944 by the substitution of a Fijian affairs board for the native regulations board. The Fijians administered their own revenue and made all Fijian appointments with the exception of Rokos (high chiefs) and magistrates. In 1940 a native land trust board was created to protect the interests of natives by reservation of land for their needs.

In 1941 and 1942 the threat of Japanese invasion hung over the colony, and the military forces were greatly ex-

Betio Island, where some of the fiercest fighting in the Gilberts took place early in 1944, after U.S. troops had repaired the ravages of battle. Only the broken trees remained as evidence of the heavy bombardment of the island

panded. Many units distinguished themselves in the campaigns in the Solomons. Taxation was heavily increased after 1941, and the output of rubber was stepped up to aid the Allied war effort. In 1943 a strike by Indian labour in the sugar industry held up production and was bitterly

resented by both British and Fijians.

On the whole the constitution of 1937 had reduced political friction, but there were inevitably some signs of discontent under the existing system. In Aug. 1943 a body known as the European electors' association introduced a motion in the legislative council which aimed at abolishing the system of nominated unofficial members in the council, thus giving the electors a greater measure of control. This motion was defeated. Similar demands were made by representatives of the Indian community. In July 1946 hostility among Europeans and Fijians and Indians was reflected in an acrimonious debate in the legislative council on the subject of "Fiji for the Fijians."

Gilbert and Ellice Islands Colony.—This comprises the Gilbert group, Ellice Islands and Phoenix Islands. These three groups form a rough triangle the approximate position of the vertices of which are: Gilbert Is., 1° S. and 175° E.; Phoenix Is. 4° S. and 171° W.; Ellice Is. 8° S. and 175° E. Area: 345 sq.mi.; total pop.: (est. 1940) 34,202; Gilbert Islands 26,180; Ellice Islands 4,613; Phoenix Islands c. 300; Fanning Island 255; Washington Is. 99; Christmas Is. 11 and Ocean Is. (1938) 2,744. Religion: Christian.

In 1937 and 1938 the islands of the Phoenix group sprang into prominence because of the development of transpacific aviation. Both the United States and Britain needed bases here, and on Aug. 21, 1937, three uninhabited islands near Pitcairn were annexed for Great Britain by a naval landing party; on March 6, 1938, President Franklin D. Roosevelt signed an executive order taking over Canton and Enderbury in the name of the United States. It had always been assumed in London that the whole of the Phoenix group belonged to Britain even if not formally occupied, whereas the United States held that sovereignty depended on occupation. These differences were resolved on Aug. 10, 1938, when the two governments agreed that an Anglo-U.S. condominium should administer Canton and Enderbury for 50 years and "thereafter until such times as it (the agreement) may be modified or terminated by mutual consent." The air companies of both countries had equal rights to the facilities of these islands. Canton became a Pan-American fuelling station and the Honolulu-Canton-Nouméa service began on July 10, 1940.

In 1941 the native government ordinance set up a native land court to deal with the simpler of the land claims, the legacy of the wars which preceded the advent of British rule. Some measure of legislative, executive and minor judicial powers were also vested in the native local councils.

The Gilbert Islands (*q.u.*) of Butaritari (Makin), Mara-kei and Abaiang were occupied by the Japanese on Dec. 9, 1941, Tarawa and Abemama in Jan. 1942, and Ocean Island on Aug. 10, 1942. The treatment meted out to the islanders by the Japanese varied in the islands but was particularly bad in Ocean Island. Generally the food situation was poor, but health remained surprisingly good. Education was handicapped by lack of supplies and European staff but was somehow carried on. Copra, normally used as currency for the payment of land tax, was destroyed or allowed to deteriorate, while the land tenure system itself became completely disorganized.

Tarawa, Butaritari and Abemama were recaptured by U.S. forces on Nov. 20, 1943, after a bitter and costly battle, and British rule was re-established. There was later a certain amount of unrest in Butaritari and Tarawa, largely owing to the demoralizing influence of the Japanese occupation. In Oct. 1944 proposals for future government of the colony were promulgated by the high commissioner.

Wading ashore under fire from Japanese machine guns on their right flank, U.S. infantrymen are shown advancing on Makin atoll in the Gilbert Islands during the invasion of Nov. 20, 1943

These aimed at ultimate self-government and specified that no European or foreigner should be appointed to a post for which an islander was fitted or could be trained.

British Solomon Islands.—A protectorate situated between 5° and 12° 30' S. and 155° and 165° E. Area: c. 11,458 sq.mi.; pop. (1937) 94,094 including 478 Europeans, 89,568 Melanesian, 3,847 Polynesian and 192 Chinese.

From early 1942 until the end of 1943 a bitter campaign was fought in the Solomon Islands (*q.v.*). The Japanese had established bases at Tulagi and Guadalcanal which were constantly attacked by U.S. and Australian naval and air forces. By Nov. 1943 almost all the Japanese in the Solomons had been driven out. Not all the islands had been occupied, and the British administration had continued functioning in Malaita and San Cristobal, working side by side with the United States military authorities. As

the campaign drew to a close and the U.S. forces withdrew, British officials returned to the liberated islands to begin the work of rehabilitation.

New Hebrides.—Condominium of Great Britain and France, situated 17° S. and 160° E. Area: c. 5,700 sq.mi.; pop. (est. 1942) 43,008 including 40,000 natives, 144 British and 710 French. (*See PACIFIC ISLANDS, FRENCH.*)

Tongan Islands.—Monarchy and British protectorate situated 20° S. and 175° W. Area: c. 250 sq.mi.; pop. 1937 census: 32,861; (est. 1942) 39,200 including 300 Europeans and 38,000 Tongans. Capital: Nukualofa. Religion: Christian: Wesleyan 21,400; Free Church of Tonga 7,050; Church of Tonga 4,000; other Protestants 1,700; Roman Catholic 5,000. The queen of Tonga: Salote Tubou; prime ministers: Prince Uliame Tugi (1937–1941); High Chief Ata (after 1941).

The prince consort and premier, Uliame Tugi, was created a commander of the British empire in the New Year's honours list of 1937. During World War II a Tongan de-

Pacific Islands, French

The French territories in the Pacific comprise archipelagos scattered over thousands of miles in the tropical zone of the southern hemisphere between Central America and the Australian continent. The most important of these islands are New Caledonia (capital: Nouméa), Tahiti (capital: Papeete), and the New Hebrides (main post: Vila), the last-named a Franco-British condominium. In 1937 the territories had a population of 160,000 composed as follows:

	Europeans		Natives	Total
	French	British		
New Caledonia and dependent islands	16,000	—	44,000	60,000
French Oceania (Tahiti)	1,500	—	45,000	46,500
New Hebrides	766	234	52,000	53,000

Economic Aspects.—New Caledonia's wealth consists in its nickel and chromium mines, of which the first exported an annual average of 8,107 short tons, the second an annual average of 62,527 short tons, during the seven years 1939–45.

Other exports were copra, coffee and cotton. Local meat canneries produce canned meat from cattle bred on the islands.

French Oceania (Tahiti) continued to draw its resources mainly from copra (annual export average, 1939–45, 17,945 short tons), vanilla, mother of pearl and phosphates (annual export average, 1939–45, 208,151 short tons). The following table summarizes foreign trade figures (quantities) for the period 1937–45 inclusive (in short tons, 000s omitted):

	1937	1938	1939	1940	1941	1942	1943	1944	1945
<i>New Caledonia:</i>									
Imports	157.7	203.3	245.3	198.0	177.6	153.3	225.9	203.0	168.3
Exports	112.2	103.4	221.1	329.3	202.4	106.4	56.4	28.2	62.8
<i>Oceania (Tahiti):</i>									
Imports	24.2	24.2	26.4	17.4	16.0	17.7	13.7	33.5	34.7
Exports	112.2	148.5	202.4	198.7	228.3	199.6	240.1	246.2	275.0

These figures reflect two factors which counteracted each other during the period, viz., (1) the temporary isolation of these territories from their French markets during World War II and (2) the role played by them as military bases after they had joined the Allies, in the early autumn of 1940.

Political Organization.—In 1937, New Caledonia formed a colony administered by a governor, a privy council and a general council. In addition, Nouméa had its own municipal council, and there were various municipal commissions in the interior of the island. In 1940 the general council was for a time brushed aside, but a decree of July 5, 1944, re-established it together with the privy council. After Oct. 21, 1945, New Caledonia was represented in the French (metropolitan) parliamentary assembly by one deputy (ordinance of Aug. 22, 1945).

The French establishments in Oceania (Tahiti) were, in 1937, administered by a governor assisted by economic and financial delegations. In 1946 these territories possessed a privy council and a representative assembly elected by universal direct suffrage. After Oct. 21, 1945, they were represented in the French (metropolitan) parliamentary assembly by one deputy (ordinance of Aug. 22, 1945).

The Franco-British condominium over the New Hebrides (*see* PACIFIC ISLANDS, BRITISH) was based on the Franco-British protocol of Aug. 6, 1914. The co-sovereignty of the two powers took the form of joint control and protection of the population of the island group, natives and immigrants, neither of the two powers enjoying exclusive advantages.

Role During World War II.—In the French possessions of the Pacific the shock produced by the defeat of the Allied armies and the capitulation of France in June 1940 was felt as strongly as elsewhere in the world. These territories decided to continue in the war, to contribute to the liberation of France as much as was in their power, and to preserve for the Allies a zone of the greatest strategic importance at a time when the coming conflict with Japan could already be foreseen. They joined the Free French movement officially on Sept. 2, 1940.

In relation to their small population the economic effort of the territories was considerable during World War II. Their military effort produced the dispatch to Africa of the *Bataillon du Pacifique* which fought in Libya and at Bir Hachém (June 1942). More than 150 sailors joined the ships of the Free French navy. Other islanders served in the Free French air force, after training in the royal air force.

Strategically, the French territories in the Pacific were of first-rate importance. The Japanese offensive extended into the neighbourhood of the New Hebrides which, like New Caledonia, became forward bastions of the Allied armies, both for defensive and offensive purposes. On March 9, 1942, General Alexander M. Patch arrived at Nouméa. On March 14, 1942, the first 30,000 U.S. troops disembarked on New Caledonia, where the general commanding in the South Pacific established his headquarters. The fleet which won the victory of the Coral sea sailed from Santo Island (New Hebrides), and the planes which bombed the Japanese in the Solomon Islands, there to halt their advance, took off from Pecoa airfield.

In 1946 New Caledonia experienced economic difficulties consecutive to wartime developments, in particular shortage of labour (previously imported from Indonesia and Indo-China) and of coal because of strikes in Australia. Hence there was a slowing-down of nickel and chromium mining operations. On Tahiti, however, industrialization continued to progress (sugar refineries, rum distilleries). The direct representation of the Pacific territories in the French parliamentary assembly, never hitherto conceded, had favourable repercussions on the political climate of the islands.

Pacific Islands, Mandated

The Pacific mandated islands are those taken from Germany and mandated to Japan under Article 119 of the treaty of Versailles following World War I. They included "all the Pacific islands north of the equator where the German flag was flown in 1914." They comprised the Marshalls, the Carolines, including Yap and Palau, and the Marianas with the exception of Guam, which the United States had held after its victorious war with Spain in 1898. In violation of provisions of the mandate, Japan fortified the islands, in comparative secrecy, after withdrawing from the League of Nations. The rising empire of Nippon kept the rest of the world in the dark about the nature and extent of such fortifications, prohibiting visitors and restricting Christian missionaries to non-strategic atolls.

After the bombing of Pearl Harbor and the subsequent seizure of Guam (*q.v.*), these three island groups gave the Japanese imperial navy a 2,000-mi. chain of "anchored aircraft carriers" sweeping in an arc from the home islands to the shipping lanes between Hawaii and Australia. Throughout the early part of World War II, these islands, used as air, submarine and naval bases, made supply and troop movements from the United States to the Southwest Pacific extremely hazardous.

However, the number and wide expanse of these scattered points of land in the vast Pacific proved a liability to the Japanese as Allied forces took the offensive, the Nipponese being unable to maintain sufficient forces at all points for adequate defense against concentrated attacks. Allied island-hopping strategy singled out principally Eniwetok and Kwajalein in the Marshalls, Palau and Ulithi in the Carolines and Saipan, Tinian and Iwo Jima in the Marianas as stepping stones to the Land of the

Rising Sun. Other islands were kept neutralized by frequent bombing and shelling and were by-passed to "die on the vine." Japanese forces resisted with such fanaticism that few escaped and few were taken alive. Only the atoll and anchorage of Ulithi was surrendered without resistance, the Japanese evidently having insufficient strength available to make a stand there. Losses by the Allies (almost 100% U.S. forces) were heavy, despite unprecedented concentrations of bombing and fire power in softening up each island preceding a landing. Among the strong points by-passed by the Allies were Truk and Yap, both of which surrendered after the end of the war.

With the exception of Saipan and Tinian, where Japan had developed extensive sugar plantations and refineries, the commercial value of the mandated islands was negligible. In fact (with the exception of Guam, which was not one of the mandated groups), few persons other than military and naval strategists even knew of the existence of the hundreds of atolls dotting the central Pacific.

Japan encouraged emigration from Okinawa and from over-crowded Honshu to many of these islands, and as the Japanese influx grew the native population decreased. During the generation ending about the time of the outbreak of World War II, the native population of the Carolines, which had stood at about 50,000 for a century, dropped to an estimated 40,000. The population of Yap, one of the Carolines, had dropped from 13,000 in early Spanish times to about 4,000 in 1939. Disease, limited diet, sex perversion and witch-doctor care of the sick, as well as huts that remained damp throughout the rainy season, were believed to be principal causes of the decrease on this particular island. Elsewhere, native losses were recorded but to a lesser degree than on Yap.

The Japanese instituted a medical program for all the mandated islands, especially against communicable diseases, and education in sanitation and health had made some progress at the outbreak of the war. Elementary education, though very limited, was instituted by the Japanese primarily as an aid to health education.

While commerce between the islands (excepting the Marianas) was of little volume and value, the Japanese had established, during the 1930s, small dairies on Yap, Truk, Panope and Palau and had given some agricultural aid to

natives where the nature and area of tillable soil made agriculture promising.

In the taking of Saipan and Tinian, the sugar industry, which had employed most of the 30,000-40,000 inhabitants and produced as much as \$6,000,000 worth of sugar for export in 1937, was completely destroyed, as air fields, roads, hospitals, repair and supply dumps and living quarters spread over nearly every acre of ground. In the larger islands of all the mandated archipelagoes, thousands of Okinawans and Japanese were returned to their native lands, and many of the remaining peoples were employed by the armed forces of the United States.

Specially trained U.S. staffs were sent to the islands under the military government to help restore damaged property, improve the health and sanitation of the natives, to aid them in establishing self-governing communities, to establish an educational program adapted to their needs and capabilities and to improve their agriculture and island industry, including handicrafts.

All the islands formerly mandated to Japan were placed under exclusive U.S. strategic trusteeship by unanimous vote of the United Nations security council on April 2, 1947. The United States was given full administrative powers and the right to fortify the islands (comprising a total area of 846 sq.mi.).

Eniwetok and Kwajalein in the Marshalls and Saipan (with Guam) in the Marianas became main points on transpacific commercial and military airways almost immediately after the end of the war. But it was clear that the principal value of the mandated islands in the future, as in the recent past, was considered by all nations to be military rather than commercial. Pacific Islands, U.S.

After 1935 there was much activity in the Pacific ocean by the great powers to complete their somewhat tenuous

Hangar for shore-based planes on Midway smouldering after a Japanese air raid in 1942. The hangar was empty at the time of attack, with all planes out on missions aimed at the Japanese fleet

claims to certain strategically located islands. It was considered by perhaps the majority of international lawyers that mere discovery of an island was not sufficient to give title to the discovering power. Actual possession together with a settlement on or some actual use of the island was considered necessary to complete the title in the discoverer.

Of the small unpopulated Pacific islands owned by the United States, many had long been recognized as United States territory. The following small islands, which by presidential executive order were placed under the secretary of navy for purposes of administration, are in this category.

Midway.—Midway consists of two small islands, plus numerous islets, surrounded by a coral reef five miles in diameter. These two islands are known as Sand and Eastern Islands and comprise 750 and 328 ac. respectively. In 1935, Midway became a regular stopover point for transpacific flights.

During World War II, the Japanese made two efforts to seize Midway. The first attempt was on the fateful day of December 7, 1941, and the second attempt culminated in the great battle of Midway in June 1942 which marked the turning point of the war. (See MIDWAY ISLANDS.)

Kure.—Only 56 mi. northwest of Midway lies Kure or Ocean Island. This coral reef encloses a lagoon in which are two tiny islets, Sand and Green, which together comprise about 500 ac. of land area. Kure was originally discovered by a U.S. citizen, but the record is not clear as to who was the first to do so. Between 1874 and 1891 it was taken possession of for the kingdom of Hawaii and came to the United States upon the annexation of Hawaii in 1898.

Wake.—Wake Island, probably the most isolated island in the Pacific, lies about halfway between Midway and Guam. The atoll consists of three islets, Wilkes, Peale and Wake, arranged in a horseshoe shape, separated by narrow shallow channels, enclosing a lagoon approximately four and one-half mi. long. After 1935, in addition to its function as a cable station, Wake Island was used as a base for commercial transpacific flights.

Wake Island was an early objective of the Japanese upon the outbreak of war in the Pacific. The assault began on Dec. 8, 1941, but it was not until December 22 that the gallant defenders of Wake Island were finally overpowered by overwhelming numbers. (See WAKE ISLAND.)

Johnston.—Johnston Island was originally discovered by H.M.S. "Cornwallis" on Dec. 14, 1807, and named after her captain, Charles James Johnston. On July 27, 1858, the island was claimed by the kingdom of Hawaii. It was then leased to private individuals for purposes of exploiting the guano deposits. Upon the annexation of Hawaii, Johnston Island became a possession of the United States.

Johnston Island, 600 mi. southwest of Hawaii, is only about 1½ mi. long by ½ mi. wide. It is considered a native bird sanctuary.

Sand.—A few miles northeast of Johnston Island lies Sand Island. This tiny island is only about 500 yd. wide and is also used as a bird sanctuary. It is considered by many as forming a part of Johnston Island inasmuch as it lies within a large coral reef which surrounds both Johnston and Sand Islands. It also came to the United States upon the annexation of Hawaii in 1898.

Kingman Reef.—Kingman reef had the distinction of being the smallest land area over which the United States had sovereignty at the end of 1946. It is approximately

150 ft. long and 120 ft. wide at high tide. Two other islets in this V-shaped atoll appear at low tide. Including submerged shoals the reef is about 8 mi. long by 5 mi. wide. The lagoon formed by the reef was used by commercial air lines until the better facilities on Canton Island became available in 1939. Kingman reef is approximately 1,000 mi. south of Hawaii along the route to Samoa and New Zealand. It was discovered by Captain W. E. Kingman of the "Shooting Star" in Nov. 1853.

Palmyra.—Palmyra, 30 mi. south of Kingman reef, is a U-shaped atoll comprising 53 islets totaling about 500 ac. in area and surrounding a lagoon about 5½ mi. long and 1½ mi. wide. It is probably the most beautiful of all the U.S. Pacific islands.

Captain F. A. Sawle, a U.S. citizen, discovered the island on Nov. 7, 1802, and named it for his ship, the "Palmyra." The American Guano company also filed bond in 1860 under the Guano act of 1856, claiming the island for the United States. Notwithstanding these claims the kingdom of Hawaii in 1862 granted one Zenas Bent authority to take possession of the island on behalf of King Kamehameha IV. In 1889 the British, finding the island unoccupied, laid claim to it. When the United States annexed Hawaii in 1898, however, it specifically included Palmyra Island.

Baker, Howland, Jarvis.—It was not until May 13, 1936, that the United States perfected its claim to Baker, Howland and Jarvis Islands when Pres. Roosevelt placed these islands under the control and jurisdiction of the secretary of the interior for purposes of administration.

With the advent of long range over-water air transport the importance of these islands immediately became apparent. Howland and Baker Islands are on the great circle course from the United States to Australia and Jarvis Island lies along the route to Samoa and New Zealand. While none has a lagoon and is, therefore, not useful for seaplanes, all are flat and may be used by land planes. They also have value as meteorological stations. In March 1935 Baker, Howland and Jarvis Islands were colonized by Hawaiian-Americans thus bringing them under U.S. control.

Baker Island is rectangular in shape, having an area of approximately 1 sq.mi. with an elevation of 20 ft. It lies near the intersection of the equator and the international date line.

Howland lies a few miles to the north and is a low, flat, sand and coral atoll. It is approximately 1½ mi. long and ½ mi. wide with a maximum elevation of 18 ft. It was on Howland Island that Amelia Earhart was to land in 1937 on her ill-fated flight from New Guinea to Hawaii.

Several hundred miles to the east along the equator lies Jarvis Island, a very low bare coral plateau approximately 2 mi. long and 1½ mi. wide.

Canton and Enderbury.—The United States agreed to exercise sovereignty jointly with Great Britain over Canton and Enderbury Islands. These islands belong to the Phoenix group which, it is claimed, was discovered by U.S. whalers at the turn of the 18th century. Representatives of both the United States and Great Britain had alternately exploited the guano resources of these islands.

By coincidence, U.S. and New Zealand scientific expeditions chose Canton as the proper location from which to observe the total eclipse of the sun on July 8, 1937. More, however, than the eclipse was observed. Both were greatly impressed by a splendid lagoon on which seaplanes might land. In addition there was sufficient surface on the flat

coral rim surrounding it for land planes. Each expedition made a monument and displayed the flag of its nation.

On March 7, 1938, a U.S. party of seven colonists landed on Canton. There they found two British agents erecting a radio station.

After negotiation between Washington and London it was agreed in April 1939 that both Canton and Enderbury Islands would be under joint British and U.S. control for 50 years and thereafter until such time as the agreement might be modified or terminated by mutual consent. Air lines of both nations were to have equal rights to such facilities as the islands might offer.

Canton Island is the largest and most northern of the Phoenix group. It lies about 1,600 mi. southwest of Hawaii. The island consists of a narrow flat rim of land surrounding a large shallow lagoon, which is approximately 4 mi. wide. Enderbury lies about 35 mi. southeast of Canton. The island measures about 3 mi. long and 1 mi. wide and has an elevation of about 20 ft. (See also GUAM; HAWAII; PHILIPPINES, REPUBLIC OF THE; SAMOA, AMERICAN.)

Pacifism

The beginning of the decade 1937-46 clearly marked the end of one period and the beginning of another for pacifists and the pacifist movement throughout the world. The period when large numbers, especially among the youth of various countries, considered themselves pacifists and signed pledges never to take part again in war "for king or country" and when governments were not averse to having their policies described as "pacifistic," was over or rapidly drawing to a close. The period of the late '20s and early '30s had been marked also by popular and highly optimistic movements for universal disarmament and world organization for peace through the League of Nations.

The Spanish Civil War which broke out in the summer of 1936 had often been characterized as the beginning of World War II. That year saw a definite distinction growing up between various types who had participated in the struggles to abolish or prevent war without having thought their way through to a clear pacifist position—including those who opposed international wars as capitalistic or imperialistic but believed in class or revolutionary war, those who believed in defensive but not aggressive war and those who would participate in a war on behalf of collective security against aggressors—and, on the other hand, the pacifists proper who on religious, humanitarian, philosophical, political or other grounds refused insofar as they were free to determine their course to take any part in war. This was the case in Europe, Japan and China as well as in the United States.

The Product of 1914-18.—The pacifist movement which faced the onset of war was almost entirely the creation of World War I and the years immediately following. The Fellowship of Reconciliation with groups in 25 or more

countries, the War Resisters International with 54 affiliated sections in 24 different countries, the Women's International League for Peace and Freedom founded by Jane Addams, the National Council for the Prevention of War in the United States, were all founded in 1914 or later. The Peace Pledge union in Great Britain was founded by Canon H. R. L. Sheppard in 1934. The British and American Friends Service committees and their counterparts in other countries, the Brethren (Dunkards) Service committee and the Mennonite Central committee were similarly post-1914 products, pacifism even in the Historic Peace churches having been largely dormant in the decades before 1914 when it did not face a major test. Neither in the Roman Catholic nor the Protestant nor the Jewish churches, except in rare individual cases, had there been any awareness for a long time of the Biblical, early Christian and mediaeval pacifist heritage. In the orient Mohandas Karamchand Gandhi did not become a national figure in India until World War I, and he became a world figure, and of course the foremost modern pacifist, only after 1919. Toyohiko Kagawa, who had an immense influence on pacifism, especially in Christian circles throughout the world (though there was some question as to his exact position after World War II), likewise was a post-World War I figure.

In Great Britain and the United States these pacifist groups, though they were distinctly in the minority, for the most part experienced substantial growth in membership and activities in the years just before and during World War II. In these and other countries pacifists opposed the entry of their respective countries into the war to the end and laboured to increase the number of those who would take the conscientious objector's position once war was declared.

Pacifism remained a powerful factor, especially in the Protestant churches, in the two great English-speaking nations. A crucial moment was the Oecumenical conference in Oxford, 1937, which for the first time in the history of the leading Protestant bodies declared pacifism one of the positions Christians might hold in conformity with the Scriptures and the traditions of Christianity. Furthermore, the conference as a whole declared war to be "a defiance of the righteousness of God" and stated that "The Universal Church . . . must pronounce a condemnation of war unqualified and unrestricted." In contrast to the pre-1914 period the leading denominations all declared that if war came they would support individual members who on conscientious grounds refused to participate and they called upon governments to make the same provisions for such members as might be made for traditionally pacifist Quakers, Brethren and Mennonites.

Though exact comparative figures were difficult to obtain, the number of conscientious objectors in the two chief English-speaking countries was several times greater than in World War I. In the United States the number of Protestant ministers adhering to a definite pacifist position was 30 times as large.

The numbers and influence of pacifists were reflected in the treatment of conscientious objectors by the British and U.S. governments and in the general popular attitude toward pacifists and pacifist activities. The provisions for the former, especially in Great Britain, were far more liberal than in World War I and in neither country was there, save in very rare instances, the brutality at the hands of the military or prison officials which prevailed in the earlier war. Likewise, there was no such public hysteria against pacifists. When early in the war such hysteria threatened in England, William Temple, then

archbishop of York and unquestionably the foremost Protestant churchman of his day, made a ringing declaration that persecution of men for conscience' sake would mean that the English had themselves succumbed to nazism, which put a stop to any general trend toward hostility which may have existed.

It should be noted here that the pacifist groups which are being described and which had waxed in importance were predominantly middle class and religious in their orientation. For a variety of reasons, certainly including the influence of the Communist party after 1941, there was less antiwar sentiment and activity in labour and left-wing circles than in 1914-18. The labour and radical opposition to war policies in those years was a much more direct and formidable political threat than pacifist groups offered in World War II. This may, in part at least, have accounted for the fact that governmental policies were less harsh and oppressive.

Specific National Movements.—In Canada, except for the Doukhobors and Mennonites, the pacifist movement was small, but after the early stages of the conflict it experienced some growth. Governmental policy toward conscientious objectors was marked by moderation. In South Africa, Australia and New Zealand the pacifists were few in number and government policy was less liberal.

In continental European lands pacifist groups were relatively weaker before World War II than in Great Britain and the United States. There was virtually no provision for alternative civilian service for conscientious objectors. For several years during the war contact between pacifists in these countries and their British-U.S. fellows was broken. These contacts were restored in the postwar period. In March 1946 the International Council of the Fellowship of Reconciliation convened in Stockholm, Sweden, with a dozen countries represented. In August a representative gathering of the Women's International League for Peace and Freedom was held in Luxembourg in the Netherlands. During the war religious pacifists in the war-ridden countries apparently earned general respect for a position which combined steadfast refusal to collaborate with foreign or native dictators and considerable material and spiritual aid to Jews and to the resistance forces, with an equally steadfast refusal to resort to hate and violence. Both governments and churches were calling them to responsible positions in the work of reconstruction.

It was practically impossible to obtain information about pacifists in the soviet union. No organized pacifist movement was possible. The laws against those who refused or evaded war service were extremely severe, but it was impossible to tell whether or not this argued for the existence of considerable numbers who opposed war on conscientious grounds.

After 1936 the pacifist movement was small in both China and Japan, especially in the former. Contacts with the west were just being restored in 1946. In Japan some groups survived and there were a number of conscientious objectors in the Japanese forces who if thrown into combat refused to shoot and died without attempting to defend themselves.

There was a nascent pacifist movement in Latin America at the end of the decade, including small groups of Quakers, Brethren and members of the Fellowship of Reconciliation and a communal settlement in Paraguay called Bruderhof.

The situation in India continued to be unique. The fact that the country achieved its independence chiefly under the leadership of Mohandas Gandhi and by nonviolent means added to the prestige of pacifism generally. The

number of Indians, however, who accepted Gandhi's religious pacifism and made a personal commitment to it had always been small. In spite of this, the Indian National congress adhered substantially to nonviolent methods. There were indications that elements with a more radical economic policy than Gandhi's and which did not subscribe to nonviolence wielded increasing influence.

Thus the modern pacifist movement, largely a product of World War I, emerged from its first great test. If the pattern of the '20s and '30s were to be repeated, it might be expected that there would be many additions to pacifist ranks from ex-soldiers who vowed "never again," but that movements for disarmament and world government in which nonpacifists predominated would tend to grow much more rapidly and would absorb the energies of many pacifists also. If men were more deeply convinced than ever of the futility and irrationality of war "now that

Home-made library built by U.S. conscientious objectors at Camp Patapsco, Md., in 1941

it had become total and atomic," there were also indications that they felt a profounder skepticism about the possibility of abolishing it. In western countries there were pacifists devoting their energies in the effort to develop mass movements for world government and general disarmament, convinced that catastrophe impended if this were not achieved in five or ten years after World War II. Others were convinced that nothing but a profound spiritual revolution could stay the forces of disintegration in modern life and that pacifists should concentrate, therefore, on converting more individuals to an outright renunciation of war and practice of a life which ruled out violence and would "suffer on behalf of evil doers" in accordance with "the teachings of Jesus." Among the latter were some who believed there was a chance (if a sufficient minority was won to an uncompromising Christian or pacifist position) that the masses might be caught up in the new current and a nation or nations might renounce war. Others believed this was utopian and that the real justification for making religious pacifists was that, like

the early Christians, they would keep themselves "unspotted from the world" and thus constitute the seed out of which eventually a new order might be born.

Attitude of the Churches.—Perhaps the crucial question was that of the churches' attitude on the issue of atomic war. The issue, so far as the Protestant churches were concerned, was clearly posed in two important documents issued by a commission of theologians under the auspices of the Federal Council of the Churches of Christ in America. The first was issued during the war in 1944 and entitled "The Relation of the Church to the War in the Light of the Christian Faith." Though the majority of these theologians were nonpacifists, they agreed that "the church dare not approve a supposition that military expediency of necessity can ever rightfully become the supreme principle of human conduct." Some of the signers of the report believed, however, that certain measures, "such as rigorous blockades of foodstuffs essential to life and obliteration bombing of civilian areas, however repugnant to humane feelings, are still justifiable on Christian principles if they are essential to the successful conduct of a war that is itself justified." They warned, however, that even this should not be taken as making "military necessity" supreme. Under no circumstances could the church acquiesce "in the view that modern war may properly, even in case of extreme peril to nation, church, or culture become total war."

In the spring of 1946 substantially the same group of theologians made a report which the Federal Council of Churches published for study on "Atomic Warfare and the Christian Faith." In this document the theologians announced: "We are agreed that, whatever be one's judgment of the ethics of war in principle, the surprise bombings of Hiroshima and Nagasaki are morally indefensible." They added further that "the policy of obliteration bombing as actually practiced in World War II is not defensible on Christian premises."

It appeared from the report that some of the members of the commission had now moved, or were moving, toward the position that obliteration bombing and atomic bombing could under no circumstances be justified on ethical or Christian grounds and that "the atomic bomb has revealed the impossibility of a just war." Consequently, they held that "the necessity for repudiation of all support of war by the church" had been demonstrated.

Others in the group, however, though agreeing "that what has been done is wrong, and that it would be wrong for any nation in the future to take the initiative in using such measures for its own advantage . . . believe that the way should be left open to regard the use of atomic weapons under some circumstances as right." For under present circumstances "if plans for international control of aggression should fail, the only effective restraint upon would-be aggressors might be fear of reprisals," and this possible restraint "should not be removed in advance."

A substantially similar position was taken in a statement issued later by British Protestant theologians. It was clear that discussion on both the practical and the ethical implications of the position here taken would have to proceed in the Protestant churches. Whatever its outcome, this discussion was certain to have a profound effect upon the future of Protestantism.

In the immediate postwar period there were as yet no indications that a comparable discussion had been undertaken in Roman Catholic circles. There were, however, isolated voices, including those of leading lay writers,

which were proclaiming that indiscriminate and "total" atomic war could not possibly meet the requirement of a "just" war as laid down by the church, and that since no conceivable modern war could now meet these standards, Roman Catholics must necessarily be conscientious objectors.

Padilla, Ezequiel

Padilla (1890–), Mexican statesman, was born on Dec. 31, 1890, in Coyuca de Catalan, Mex. He studied law in Mexico and abroad, fought under Pancho Villa in the revolution of 1914 and fled the country after Villa's defeat in 1916. Returning to the country, he served his first of three terms as federal deputy in 1922. He twice held office as senator and in 1926 received an appointment as professor of law at the University of Mexico. He was also attorney general of the republic in 1928, secretary of public education in 1929 and minister to Hungary and Italy from 1930 to 1932. When Manuel Avila Camacho was elected president in 1940, he made Padilla his foreign minister. A skilled diplomat, he was outspokenly anti-axis and urged a firm policy of hemispheric solidarity. Immediately after the Japanese attack on Pearl Harbor Mexico severed diplomatic relations with Tokyo. When the axis powers ignored Padilla's protest against the submarine sinking of Mexican ships, the Mexican chamber of deputies declared war on Germany, Italy and Japan on May 29, 1942. Elected president of the Inter-American conference in Feb. 1945, Padilla attended the San Francisco conference of that year. He resigned the foreign ministry in July and was nominated for the presidency by the Mexican Democratic party in Nov. 1945. Padilla was defeated by Miguel Alemán in the presidential elections of July 1946.

Paget, Sir Bernard (Charles Tolver)

Sir Bernard Paget (1888–), British army officer, was born Sept. 15, 1888, son of the bishop of Oxford. Educated at Shrewsbury school, he served in World War I as a brevet major and was awarded the distinguished service order, the military cross and the Italian silver medal for military valour. He was commandant of the Royal Staff college of Camberley, 1938–39. In May 1940 he di-

rected the successful withdrawal of a British force in the disastrous Norwegian campaign. That same month he was appointed chief of the general staff of British home forces. Gen. Paget was made commander in chief of the home forces on Nov. 18, 1941, and commander in chief of British forces in the middle east under Field Marshal Lord Wilson, then supreme commander of the Mediterranean (Dec. 27, 1943). In late May 1945 Gen. Paget was ordered by Churchill to intervene in the fighting between French troops and natives in the Levant.

Pahlavi, Mohammed Riza

Mohammed Riza Pahlavi (1919–), shah of Iran, was born Oct. 26, 1919, in Tehran. Educated in Switzerland, he was given thorough military training and commanded his own regiment while in his teens. In Sept. 1941 his father, Riza Shah Pahlavi, failed to comply with British and soviet ultimatums that he oust all axis nationals from Iran. As a result troops from both countries overran Iran and Riza Shah renounced the throne in favour of his 21-year-old son on Sept. 16, 1941. The young shah made few public statements, although he did declare, Dec. 31, 1943, that he approved the Allied Tehran declaration concerning Iran as the "first application of the principles of the Atlantic Charter."

Painting

If in future times someone tried to read the events of the decade 1937–46 from the paintings of that period, he

Pablo Picasso (seated centre left) with a company of friends in his studio. As an exponent of abstract art, he was one of the dominant influences on painting throughout the decade 1937–46

would probably arrive at the following conclusions: people who lived and created during those ten years were somewhat neurotically plagued by an increasing awareness of the motivating forces of their own egos, void of a common creed but bravely striving to rid themselves from outworn beliefs and empty forms. These people were working in an experimental mood because they did not really know what they were working for and they must have had much time on their hands to explore so devotedly the relations of colours and forms, of space and light and to invent or revive remote symbols. Viewed geographically, the occident must have been culturally divided between the central and eastern part, adherent to a strongly conservative cultural and aesthetic pattern, and the western part, characterized by a revolutionary and somewhat chaotic situation. Especially France must have been the most powerful state in the world, judging from the number of French pictures abroad.

These, approximately, may be the impressions gained from an examination of the artistic production of the decade. While they would not be totally wrong, they would not permit an immediate conclusion that the most terrifying of all wars had devastated for five years and more the surface of the earth, that political systems built for "a thousand years' realm" had collapsed, that resulting from it famine and mental despair had swept over the world and that complete uncertainty about the future of this planet had gripped innumerable minds. Little of these facts could be observed directly from the study of art.

This is stated here at the beginning in order to warn

against a cheap parallelism between art and the political-historical field. People are all too inclined to project into the art work what is already known from other sources and to dictate a uniformity of expression which is foreign to history. To believe that painting and sculpture, philosophy and poetry should, with necessity, reflect the happenings in the field of political history would presuppose man to be unfree, completely determined by the outside and make paintings merely an illustration of actions.

Seduced by such a mistaken belief in a complete parallelism of history and art, some have, for instance, projected the political decline of the Roman empire into its artistic production and seen in it nothing but the disintegration of classical beauty. While this was not completely erroneous, students learned to recognize in it rather the transformation of Hellenistic-Roman art into new styles such as Islamic art in the orient, Sassanian art in Persia, Byzantine and migratory art in Europe. Artistic production is a continuous process and it depends on the point of view chosen whether a phenomenon is seen as an expression of the decline of old forms or as an announcement of the rise of new concepts.

This example has been chosen in order to make clear that the sphere of artistic creation is half autonomous, is in advance or behind the other problems, has its own problems with its own evolutions and with its own rhythm of evolution. Only after this has been understood can people begin to isolate those factors in painting which can be used as a bridge between the history of the epoch at large and the history of art in general. This sociology of painting is not dealing with the most pertinent factor of art, which is the solution of its artistic problems, but it is an adequate one for a handbook on the general history of a certain period.

* * *

THE MOST APPARENT reflection of political history on the art of the period 1937-46 was the fact that the artist in the dictatorially governed countries, whether fascist or communist, was not free to express without restriction what seemed important to him. For the first time in history the censorship of the state was not only concerned with the subject matter, that is, the ideological content of an art work, but also with the style—the form in which ideas should or should not be expressed. The U.S.S.R. and Germany agreed in their official disapproval of abstract and expressionist art, with the result that the observer of the future would not find paintings of this type, so characteristic of the artistic production of the same period in the western democracies, in the exhibition catalogues or publications of those states. The reasons for such condemnation were, however, different: in Germany the advanced trends of modern painting were curbed first of all because Hitler, the amateur artist, disliked them, secondly, because the small businessmen and lower employees who constituted the rank and file of the Nazi party, once raised to power, could make their retarded cultural standards the official will of the state and finally because abstract and expressionist art were neutral toward or unconcerned about the political revolution of the country. Consequently, modern art was branded “Jewish,” “Asiatic,” “degenerate,” “subhuman.” The pictures of the leading artists of an antinaturalistic art, regardless of which nation, were taken down from the museum walls, sold at public auctions in Switzerland (with the result that many of them found a permanent place in U.S. collections) or toured in special

propaganda exhibitions through the country in order to make the people aware of the “degeneracy” of the pre-Hitler period. This last opportunity for seeing publicly works by such artists as Lionel Feininger, Paul Klee, Franz Marc, Emil Nolde, etc., was grasped eagerly by the more advanced public while it offered the aggressive elements an opportunity to join in with the official ridicule.

Some of the best modern artists like Kaethe Kollwitz (1863-1940) were not only forbidden to exhibit but interdicted to work. Jewish painters were excluded from the state-organized professional league and their works were eliminated from museums and exhibitions. Some of the leading painters of Germany and Austria fled their countries, unwilling to betray their human and artistic convictions, and created abroad. To name only a few: Max Beckmann went to Holland, Oscar Kokoschka to England, Feininger (although born in the U.S. but living most of his life in Germany) and George Grosz to the U.S. On the other hand, art was fostered which expressed a positive attitude towards the new state and its racial-biological philosophy in an academically correct form. Idyllic landscapes, representations of the workman, the soldier and the storm trooper, but most of all, nude men and women glorifying the Nordic race and stimulating the sense of propagation, rendered in a style of minute realism or academic generalization, abounded.

While in the U.S.S.R. at the beginning of the revolution until the middle '20s the most advanced forms of abstract art were put into the service of a new revolutionary concept of society, this attitude of the government was later reversed by Stalin. The different branches of abstract art were declared to be “formalism.” The task assigned to art in the Soviet republics was, primarily, to illustrate the positive aspects of the social revolution and to glorify the health and strength of the Soviet people. As the adequate style one considered the academic bravura manner which characterized Russian painting in the epoch between 1870 and 1900 and which found its most typical representatives in Ilja Repin and Wassili Wertschagin. Another group worked in an out-of-door impressionism, modified by broad poster-like effects, such as were typical for the handsome travel posters of Scandinavia. Perhaps the most advanced artists of this group, eulogizing the out-of-door sports, the army and women, was Alexander Deyneka. Other more advanced impressionists were S. V. Gerasimov, K. C. Petrov-Votkin, N. Kupreanov and V. Lebedew.

Both governments in fostering academic-naturalistic art turned the clock back artistically by from 30 to 50 years. Recognizing the academically correct and the nationally positive as the highest standards of value, they legalized the conservative. Consequently, future research would have to look for two arts in order to understand the period: the officially recognized art as displayed in public and the art of the “forbidden” masters as practised secretly in their studios or created abroad.

In Italy the official attitude was different. Since in fascism the will of the dictator was turned into the will of the state, it was of importance that Mussolini showed some understanding of the more advanced trends of contemporary art. He was personally acquainted with Filippo Marinetti, one of the leaders of the abstract futurist movement, who had joined the ranks of the early fascists. Marinetti's “Futurist Manifest” of 1910 contained those elements of dynamism which later found political release in the fascist movement. Consequently, there never existed a censorship in regard to style (or form) in Italy, and the “Biennale” in Venice, one of the largest international exhibitions in Europe, admitted freely every type of art.

Italian painters could, of course, not criticize pictorially institutions of their country nor express a "subversive" philosophy, but they were not limited in their manner of painting and only indirectly influenced in their choice of subject matter. But the absence of "problematic" themes was clearly noticed in the work of Carlo Carra, Felice Casorati and other of the leading painters.

Mexico was the only other country in which, although gradually receding, the impact of political life upon painting could be noticed. The concern with the national revolution and its aim of emancipating the Indian peon and the proletarian native city dweller was expressed by a continuous stream of frescoes which flowed forth after Diego Rivera and José Orozco began to work for the revolution in 1923. The revival of the Indian past, furthered by archaeological studies in which many artists took an active part, brought about an enrichment of form and content which made Mexican art a unique and forceful phenomenon.

The artists of the western democracies expressed the political events which transformed the globe during the decade by an individually chosen vantage point from which the artist either looked in the direction of the great conflagration or remained unconcerned. Official influence was not exerted and the self-evolution of the main themes of western painting was not disturbed. An important stimulus from government was given to painting in 1935 when the Works Progress administration's Federal Arts project was introduced in the United States. Part of the general program to counteract unemployment and stimulate production, it initiated a government-sponsored program for providing artists with workshops, tools and materials. More important, it provided the opportunity for murals and paintings to be executed in post offices, schools, government agencies, etc. This program brought about a revival of fresco painting, occasionally influenced by the style of the Mexican school, and directed the attention of the artist to the realities of the daily life and the scenery of his own country. Far beyond the material support, the WPA program represented one of the most far-reaching and fruitful cultural actions of any government in modern times. In bringing together artist and community it helped temporarily to bridge a gap which had been widening from the time the French Revolution broke the affiliation of the artist with court and church. How many of the artists charged with the task of monumental painting were able to find an original solution, or were even prepared for the merely technical problems, was another question.

* * *

WORLD WAR II called a large number of the younger artists to arms. How many valuable talents were lost on the battlefields and in air raids was unknown. In all countries painters served as pictorial recorders of military events either for the government or for the armed forces directly or for private organizations, especially for newspapers and magazines. In England an interesting volume was compiled: *War Through Artists' Eyes* (London, 1945) from which the paintings of Richard Eurich, Paul Nash, John Piper and Graham Sutherland may be mentioned. In the United States official war artists and artist correspondents accompanied the navy, the air corps and the army into all four corners of the world. Exhibitions by the artists of *Life* magazine, of the Abbott laboratories on army medicine and other enterprises showed, in general, a high level of truthful observation and of skilful rendering. The former type of battle scenes and national glorification pictures yielded to an interpretation of small instances in which the fear,

agony and destruction suffered by the individual were recorded. The pictures by Millard Sheets, Joseph Hirsch, David Fredenthal and Richard Breinin may be mentioned as moving and effective documents.

In a few powerful works artists, beyond the task of recording, contributed to an interpretation of the spirit of the great cataclysm. They created symbolic images, in which the horror and despair of mankind was expressed by forms betraying the inner conflict of the period. Like a premonition of the events to come, the Mexican David Alvaros Siqueiros painted in 1935-36 the panel entitled "Collective Suicide," in which the pending catastrophe appears in the form of a visionary holocaust. The same artist created a picture of haunting intensity entitled "Echo of a Scream," a free translation from a cover of *Life* magazine, in which, by means of exaggerated plasticity, a surrealist effect of the mental and physical agony of a child (crying for all children in the world) was achieved. In 1937 Pablo Picasso, the Spaniard who had lived from 1901 in Paris, painted "Guernica," a monochrome canvas, 11 ft. high and 25 ft. long. The name of the picture referred to a small Basque town which was totally destroyed by German bombers under Gen. Francisco Franco in a punitive action. In it is seen the disjointed fragments of men, women, children and animals which by the violence of their gestures and the exaggeration of their forms cry out the protest of a violated humanity. The different motifs of this painting had their roots in earlier works of the artist, back to 1925, and one may therefore say that the painter as the most sensitive seismograph of a period had already created signs which pointed towards the essential experiences of an epoch. Not only does this picture speak of aggression and protest; it is in itself by power of its imagination and form aggressive and exhorting.

In the same year another visionary monumental picture was completed, "The Eternal City," on which the Russian-born U.S. painter Peter Blume had worked from 1934. While in Picasso every form is abstracted to its most pungent expression, in Blume a microcosmic universe is created which has the over-precision of a dream. But as in a dream it shows also the gradual fusion of many realities arousing a surreality of experience. The ruins of the Forum, from the caverns of which people are emerging, the jack-in-the-box-head of Mussolini intentionally out of scale with the rest of the picture, the grotto image of the "Man of Sorrows" and fascist soldiers beating up people form as in Picasso's painting an interpretation of the disfigurement and disjointment of a formerly noble and beautiful world. Looking for parallels in the past, one thinks of Matthias Gruenewald in front of Picasso's picture, of Hieronymus Bosch in front of Blume's work.

A truly transformed and evocative work of art which grew from the experiences of the war was the series of sketches which the English sculptor Henry Moore did in the subways of London during the German bombing attacks; these were published under the title *War Shelter Sketch Book*. Pen drawings and water colours, they represent the denotation of a sculptor who had seen people return to the most primitive functions of life and had watched the misery and the promise of existence in the sleeping, crouching and huddled poses of the modern cave dweller. In Picasso and Moore is noticed that return to the primitive and basic in form and spirit which the artist felt aroused to defend in time of crisis. In such works the war was not represented from without but from within; that is, the artist was experiencing as an individual im-

pulses similar to those which, in mankind at large, are responsible for the breakdown, the defense and the rise of ideals.

* * *

THE TWO most challenging artistic problems posed to the artist were those of abstract art and surrealist art. Abstract art went back to about 1910, surrealist art to about 1920. But both of them still held the centre of attention in the period 1937-46.

Abstract art "abstracted" more or less the potentialities of pure form from outer visual images and either related them to the otherwise invisible realm of emotions or created with purely formal configurations. There was no doubt that this advanced position of abstract art had not yet been understood nor accepted by the majority of the people, who instinctively connected painting with the depiction of visible objects. But abstract art was no longer what it was in the beginning. Not only had it advanced its own problems, it had absorbed elements of surrealist art and created a pictorial language of symbolic images. This development was to a large extent because of a single personality who exerted a powerful influence upon his time such as had not occurred in European art from the days of Jean Ingres and his studio. He was Pablo Picasso, who from the beginning of the century had excelled in originality of invention and execution. Picasso's often changing manners became the starting points for innumerable artists and established an international pictorial idiom which became spoken everywhere. He stimulated the growth of nationally modified painting styles, as could be seen in Cuba or in Mexico. After he stopped painting the inhabitants of the fringe of human society in the early blue and rose period (1901-05), he rarely created works which were outwardly pleasing in colour or line or unusual in subject matter. If one discounts the tremendous propaganda of the press and the dealers which must have had some influence, it was perhaps the uncompromising radicalism and its consistent artistic realization which contributed to the leadership of this Spanish-French artist. His explorations of abstract form and colour relations and his interpretation of the human figure and the introduction of enigmatic symbols (broken swords, bulls, classical busts, etc.) immediately become accepted by artists all over the world.

The pictures which Picasso produced during the decade 1937-46 did not represent a new departure but paraphrased the style formed about 1930. With the exception of "Guernica" and its predecessor "Minotauremachie" (1935), they were not visibly concerned with contemporary happenings, but they explored patterns and signs demonstrated on still lifes and female figures primarily. Triangular and lozenge shapes pieced together with deep, unmodulated colours recall the effect of stained glass windows. Sharp angles make the forms recede strongly into space. An irrational total concept is carried out with utmost lucidity. Pieced-together frontal and profile views translate the homogenous human face into a haunting mask utterly distorted and yet, as a mask, strangely complete. The disintegration of the former concepts of reality and the dissolution of their inherent evaluations seems to be playfully demonstrated in Picasso's paintings.

When in 1946 the British resumed cultural exchange with other countries, they invited as the first to exhibit in the Tate gallery in London Pablo Picasso and Henri Matisse. Both were in a way the "old masters" of Europe and

yet so challenging appeared their paintings across the channel that a heated controversy was stirred up in the English art journals and newspapers. Matisse, then a man of 77 years of age, was just as youthful as Picasso in his products. His art, aesthetically in the tradition of a Renoir, combined sense appeal with high artistic intelligence. It was the outgrowth of pleasure and its aim was pleasure. Matisse continued to paint dressed and nude women posed against richly ornamented backgrounds, to paint interiors and still lifes with sweeping abbreviations and in colour combinations which became the delight of the fashion designer. In fact, Matisse's paintings grew from the same ground as French fashion design. They are not explorations of unknown fields of mind and soul but the independent interpretations of the things everyone has seen and known as pleasant. Consequently, his influence upon decorative painting and decoration in general was very great. Raoul Dufy continued along the line of Matisse with enchanting stenographic pattern-landscapes of the French scene which by their staccato rhythm and gay elegant colours convey a feeling of wit and delight.

Jean Lurçat, the painter of empty imaginary ruin landscapes, turned toward a more realistic and highly decorative approach. This turn toward the decorative and the pleasing could be observed in several of the older and formerly more rigid artists; it may have been because of the orders received for tapestries and furniture covers which after 1935, under the sponsorship of Mme. Marie Cutoli, brought about a fruitful co-operation between painter and applied arts. The continuity of a great tradition from mediaeval times could be studied well in the exhibition of French tapestries in the Musée d'Art Moderne in Paris in the summer of 1946.

A few of the French painters found a domicile in the United States during World War II. Fernand Léger worked on large wall paintings, some of them executed for U.S. sponsors (Nelson Rockefeller, Wright Ludington, etc.) and in them went a step beyond his former static abstractions. Under the impact of Picasso's art of the early '20s he also began to show a concern with three-dimensional plastic forms fitted together in more flexible designs which recalled the action of pistons and wheels in a starting locomotive.

André Masson pursued a style in which free dynamic line drawing emerged from a rich inner imagery. Thus, a combination of free abstractions, in the manner of the late works of Wassili Kandinsky, and symbolism was created, the influence of which was strongly reflected in some of the younger artists of the United States.

Of the younger French artists who emerged during World War II none had acquired the stature of his predecessors by the end of the decade. It was too early to give a judgment on them. One may mention the work of André Marchand.

In England, more conservative in its paintings than most other countries, abstract and surrealist art showed a rejuvenating effect. Even though most of the country's artists were dedicated to representation of actual scenes, abstract art had been helpful in organizing design, emphasizing the essentials and admitting the imaginative. With its support Paul Nash developed his primarily lyrical landscape painting, while John Piper created architectural scenes of an extraordinarily intense mood. Graham Sutherland increasingly yielded to the fascination of Picasso's pictures and after depicting the devastations of wartime England created tormented symbols of struggle and pain in his thorn tree pictures. All of these artists challenged the tendency of English painting to render only the pleasing

Below: Cossacks charging nazi invaders, as sketched by the Russian artist Adriana Yermolaeva, and reprinted in *Your Defenders*, a collection of soviet war art

and sociable aspects of human life. No less lyrical than the English pre-Raphaelites, they deepened their emotions by delving into the depths of human existence. In spite of the influx of enhanced vitality, their paintings are more delicate in colour and more fragile in design than those of painters of other nations. A place of its own belongs to the water colours of the sculptor Henry Moore, among the most original creations of the period. With the eye of the sculptor he reduced human forms to rudimentary moulds and casts which live their silent, prenatal existence in the space of an aboriginal nature. A modern mythology is re-connected with the spirit of the columns of Stonehenge.

In the Netherlands abstract art found an uncompromising representative in Piet Mondrian, who died as a political refugee in New York in 1944. His rectilinear compositions of well-spaced black lines, interspersed by coloured cubes somewhat comparable to a musical score in line and colour, not only found successors in the United States such as Rice Pereira, but had a strong effect on typography and other fields of design. This was understandable because an art exclusively based on proportion and relation of forms free of reference to nature or to the mind is by its very character a decorative art.

In the United States abstract art arrived 20 years later and therefore was reaching its full impact at the decade's end. It had half-expressionistic, half-abstract pioneers in John Marin and Lyonel Feininger. Both formed their styles under the influence of German expressionism and French Fauvism. Both showed a consistent maturing of their work which, in spite of its semiabstract nature, is based on an intimate observation of nature.

From the younger generation a few stood out by the same consistency and technical ability: Charles Howard, Stuart Davis and Karl Knaths built their paintings in the spirit of architectural structures while William Baziot, Robert Motherwell, Hans Hoffmann and Ashile Gorky produced in the spirit of freely-flowing musical associations with an emphasis on rich colour textures.

In Latin America Carlos Merida translated the mythical world of pre-Columbian civilizations into hieroglyphic abstract compositions. The Chilean Matta Echaurren, also influenced by Picasso, was concerned with phosphorescent colour—spaces out of which never-before-seen emanations burst forth. In Cuba quite a number of followers of Picasso blended the tropical colour scheme with semi-abstract designs imported from Paris on a high level of artistic refinement. Amelia Pelaes, Wilfredo Lam and Ponce de Leon may be mentioned.

* * *

EXPRESSIONISM developed at the same time as abstract art in France and Germany. But while abstract art harked back to the late paintings of Paul Cézanne, expressionism grew on the field prepared by Vincent van Gogh and Eugène Gauguin. This primarily northern style lost one of its originators and greatest representatives with the death of the Norwegian Edvard Munch in 1944. With its emphasis on emotional strengthening of colour and expressive distortion of forms, such as Matthias Gruenewald and El Greco had shown centuries earlier, it had found a strong incentive in the challenging atmosphere of war and revolutions from 1914.

In France George Rouault alone developed the expressionist elements of the Fauve period of Matisse and Picasso (1905–06) to a brilliant although monotonous climax. His clowns and men of sorrow, his harlots and oriental prin-

cesses transcend their destiny expressed in the harsh stamp of their immobile masks by the grace of precious colours of the quality of molten glass pastes. Rouault was termed a religious painter and his art was likened to that of the stained glass windows of mediaeval cathedrals. His art was enthusiastically greeted in England and the United States by private collectors and museums.

The impact of the serious work of some of the leading expressionist exiles of Germany, living during World War II in the Netherlands and England, was felt in the U.S. Oscar Kokoschka did not paint much during his stay in London, but many of his former paintings sold by the Nazi government from the walls of German museums found a new place in U.S. collections and contributed to the growing respect for this inspired painter. The same was true of Max Beckmann, several of whose large triptychs were immediately absorbed by U.S. museums and private collectors. Both were emphatic colourists and dramatic interpreters of their time.

Mexico gave the world a number of expressionist painters of rank in whom, as in Europe, the ideology of their own world deeply fused with the form expressive of it. It is unnecessary here to write about Rivera and Orozco, who pursued the line of their revolutionary and national ideals in murals and paintings. Orozco's "Divebomber and Tank" combines the rhythm of Aztec decoration with the organization of abstract painting into an expressive symbol. David Siqueiros' art dealt prevalently with social problems in somber and monumental compositions. Rufino Tamayo, who worked in the United States, became perhaps the foremost expressionist painter of his nation. In colour and design the very spirit of Mexican pre-Columbian art seemed reborn. The fresco in the art library at Smith College showed him eager to emulate his Mexican predecessors. But his true gift seemed to be in the direction of painting without any ideological tendency, in the display of his brilliant colour sense and his inventive compositions.

Another Latin-American expressionist of brilliant gifts was the Brazilian Candido Portinari, whose frescoes in the Library of Congress in Washington, D.C., are among the most impressive executed in the United States. His fanciful interpretations of Brazilian mulatto life have less weight and conviction than Mexican painting in general, but enchant by their witty and skilful realization.

In the United States Jack Levine showed a forceful expressionism dedicated, like that of George Grosz, to aggressive commentaries on contemporary society. Ivan le Lorraine Albright was an expressionistic realist or a realist expressionist, looking at the world with a magnifying glass and enjoying the horrors of his distorted vision. Elements of magic, realism and expressionism were fused in Ben Shahn's paintings, which proved a keen sense for original composition applied to sharp focused interpretations of city life. The unifying element in most expressionists was that they were actively concerned with humanity, that out of this concern there was often an aggressive or revolutionary attitude in their art expressed by a declamatory richness of texture and form. Exceptions to this were Mark Tobey and Morris Graves, who gave the visionary's response to the outside world in exquisite creations which independently continued what Paul Klee first had created in western art: emotional diagrams in which dreams and play flow together after the manner of a world-wise child.

* * *

A LATER ARRIVAL on the European scene, developed around 1920–25, was surrealism. Its main representative, Salvadoré Dali, went in 1938 to the United States, followed

by Max Ernst, Yves Tanguy and others, and thus helped to spread the style of surrealism over another continent. It was based on the same contradiction as that experienced in dreams: the creation of incoherent and translogical images rendered with minute precision of details which lend by their exactitude conviction and emotion to otherwise inconceivable appearances. The medium for such precision in the service of the fantastic or unusual was the revival of a painstaking, even microscopic, draughtsmanship, an "old masterly" approach to a contemporary problem. The ikonography of the surrealists was derived, to some extent, from sex symbolism but was related to fears and fascinations which had their roots in the experience of time and space. In other instances the fantasies of surrealist painting were of a merely literary nature, a modern form of 19th century entertainment art. As such, it had considerable influence on modern advertisement and window decoration.

A side branch of surrealism was neoromanticism. The same emphasis on "old masterly" techniques and skills was put in the service of painted romances. Instead of the surrealist "defaitism" we see ruins and people of a beautiful past conjured upon a fantastic scene. This approach had its origin in France, but again because of political events some of its best representatives emigrated to the United States: the Italians Rico Lebrun and Corrado Cagli, the Russian-French Eugène Berman. The latter was especially creative as a stage designer.

In addition to the exponents of the newer trends in art there were still a number of excellent impressionists and naturalists active during the decade in different parts of the world: Prince Eugene of Sweden; Pierre Bonnard, Dunoyer de Segonzac in France; Muirhead Bone in England; Charles Burchfield, Alexander Brooks, John Carroll, Peter Hurd, Eugene Speicher, Boardman Robinson, Maurice Sterne, Henry V. Poor in the United States. While their work did not reflect the ten years primarily, it very well mirrored the broader aspects of the contemporary age.

* * *

Looking for a common denominator in painting of the decade, the critic would have to mention the increasing influence of abstract art. This withdrawal from the task of representing and interpreting visual impressions was the deepest break with a 2,000-year tradition of western art. It apparently had its reasons, partially in the ever-increasing awareness of the motivations and the resulting motives, symbols and designs which led to similar self-consciousness and dissolution of formerly naively accepted realities in psychology and literature. It may also have had a relation to the dissolution of the concept of reality in modern physics. Where every constant in time and space is but a relation, dependent on the point of view from which judged, art itself may easily turn to the exploration of relations of a primarily formal nature. The instability and revolutionary atmosphere of the decade also found expression in the experimental character of its art. While subject matter, a common point of reference between onlooker and artist, disappeared in abstract art, it took on a new importance and transcended reality in surrealism. (See also SCULPTURE.)

Paints and Varnishes

Production of protective and decorative coatings practically doubled during the decade 1937-46. The technical program kept the paint industry apace with modern developments of other industries. Finishes and finishing methods underwent continuous evolution in line with the needs of the consumer, and with the new and improved raw materials which became available to the coating manufacturer. The wartime emergency brought forth many new products and re-examination and utilization of older materials that otherwise might have become obsolete at an earlier date.

Because of the military need, many special fields were studied. In the case of anti-fouling paint for marine use, a hot plastic composition was developed which gave much greater protection against marine growth and thus increased the efficiency of naval ships. The necessity for frequent dry-docking was greatly reduced, permitting longer cruising periods. Flame-retardant compositions for tarpaulins and tenting were other important wartime developments with real value for civilian use in peacetime. Circus tents presented much less fire hazard as a result of this work. The efficiency of the coating was largely dependent on its chlorinated paraffin and antimony oxide content.

Metal treatment and metal protective paints received a great deal of attention and were considerably improved through these studies. The importance of proper metal preparation had been illustrated many times, and chemical treatment of metal as well as mechanical cleaning became well established during the decade. Chemically-prepared coatings such as phosphates and chromates proved themselves on metals such as galvanized iron, steel, magnesium and aluminum in improving both adhesion and corrosion resistance of the painted surface.

A thick protective "strip coat" was developed for use on mechanical parts such as gears to eliminate corrosion and mechanical injury during shipment. This composition was unique in that it could be applied hot by dipping; it quickly solidified to a moisture-resistant coating. The material exhibited little adhesion to the part being coated and could be peeled off easily just prior to assembly. Not only was the coating of great value for shipment of spare parts to military bases, but in some cases it proved valuable for inter-factory shipments of highly machined parts. The desirable properties, rust protection and low adhesion, were secured by using mineral oil and ethyl cellulose in

Luminous paint filled many needs in blackouts during World War II. This "blacked out" scene shows an air raid warden's luminous helmet, belt, arm band, stick and warning signs, all visible for approximately 150 ft. in the blackout

the composition.

Camouflage.—Camouflage and blackout paints were of real value during the war. They were prepared from non-critical available materials whenever possible, notably wool grease in Britain and asphalt and other emulsions in the United States.

The necessity of having proper photographic value, particularly in the near infra-red, received a great deal of attention. Since infra-red photography was widely used by observation planes because of its better haze penetration as well as camouflage detection, it was necessary to have all military camouflage exhibit the same infra-red reflectance or brightness as the surrounding natural terrain. The coloration should also be the same, to confuse visual observation. This was particularly a problem in the necessary range of green colours, since most trees and grasses photograph a very light gray in the infra-red, and the common chrome green paint pigments photograph black by infra-red methods. Desirable green colours matching in both the visual and infra-red regions were produced by combination of special green pigments such as chromium oxide and antimony sulphide black.

Paint in Industry.—In the field of industrial application of finishes, the use of electrostatic spray and electrostatic "detearing" methods stood out. Through the use of a high potential electrostatic field, an article being sprayed conserved a great deal of material, but more uniform coats could be applied in a shorter time. This method was more efficient on small irregularly shaped articles than on items

with large plane surfaces such as household refrigerators, etc. Electrostatic "detearing" was especially valuable in dip-painting of certain articles, for example, toys or chair seats where the removal of a soft bead or heavy ridge of paint which may stay soft or gummy is desirable.

Infra-red baking as a means of commercial finishing of painted products gained wide acceptance during the decade. Originally started as an automotive production method, the method had considerable popularity before World War II. Increased production speeds urgently needed for the war emergency gave real impetus to infra-red baking methods; one of the main advantages of this process was the relatively low cost of equipment installation as compared to the convection type oven. Infra-red baking by no means displaced the more conventional baking methods, but it augmented and supplemented them greatly. The method became particularly useful where rapid heat-converting resin compositions could be used and where it was possible to design the oven to give fairly uniform heating of the metal or other surface being coated; for example, a stamping or other article where the metal was of fairly uniform thickness. In certain instances the tendency to produce uneven heat was of little consequence, as in the case of automotive primers.

Composition.—The composition of coatings was, of course, under continuous study by the industry. Improvement and advances in synthetic resins was the byword of the decade. Alkyd resins became predominant; most popular alkyds were made from phthalic anhydride chemically reacted with glycerine or other polyhydric alcohol and modified with various proportions and types of vegetable oils. For example, when linseed oil was used, the resin dried in air without heat, whereas if coconut oil was used, the resin was usually cured or dried by baking. They were available in an almost unlimited number of variations designed for specific uses. Special alkyds were designed for metal protective paints where the material had to be applied by brushing, as to bridges. Here the resin content from the phthalic anhydride and alcohol would be low (possibly 12%) in order to have easy brushing properties; linseed oil would probably be used to have an air-drying finish.

In the case of spraying materials, such as automotive finishes, the resin content might well be considerably higher—in the range of 40–50%—to secure greater durability, hardness and speed of drying.

Special resins were widely used for high temperature baking whites, such as those used on refrigerators; they practically displaced nitrocellulose lacquers for this work. Because of their versatility, good performance and reasonable cost, there was hardly a major finishing field not affected by the utilization of alkyd resins.

One of the newcomers that proved very popular and useful was the urea-formaldehyde type of resin, including melamine resin. These materials could convert or harden quickly with heat and thus were important in infra-red baking; they became widely used with special alkyd resins for appliance whites and other hard, tough baking materials.

Hydrocarbon resins synthesized from petroleum and turpentine made a place for themselves and continued to gain popularity. In the field of high chemical resistance, phenolic resins, chlorinated rubbers and vinyl materials continued to be predominant.

Silicone resins were another development of the decade; they combined excellent resistance to high temperatures found in domestic stoves with extremely good resistance to household food and cleanser materials. The silicone resins

were produced in a variety of consistencies for various types of application; their relatively high cost was their principal drawback.

Although drying oils continued to constitute a major portion of commercial coatings, the shortages of tung, perilla and other imported drying oils promoted major developments and improvements in domestic oils such as linseed, soybean and fish by removing much of their non-drying components, either by using a solvent to extract them or by fractional distillation of their fatty acids. These oils could also be improved by isomerization so that their drying character and resistance of their drying films more nearly approached those of tung oil. The availability of large amounts of raw castor oil from Brazil permitted large commercial exploitation of a process of dehydrochlorination whereby the completely non-drying character of raw castor oil was changed to superior drying characteristics between those of linseed and tung oils.

Home Paints.—While industrial finishes underwent continued improvement, trade sales materials for the painter and home owner also were improved through use of the new materials, particularly the alkyd resin finishes. These products, in general, exhibited greater durability, better gloss retention under exterior exposure, easier washability and better colour retention for interior finishes.

The decade saw the introduction of resin emulsion paints, which gained great popularity. The fact that these materials were easy to use on a great many surfaces contributed greatly to their acceptance, and their substantial lack of solvent odour and fire hazard plus easy washability of brushes used with them made them exceptionally popular with the home owner.

The British Industry.—Great Britain's paint industry during the decade had an unusual problem of raw material supply, for it, unlike the United States, imported a major portion of paint materials. Homemade substitutes were sought particularly for the bulky, low-cost materials such as carbon black, iron oxides, barytes, talc, asbestos and diatomaceous earth among the pigments. Petroleum spirits were replaced in many cases by solvents derived from home-produced coal tar.

Proximity to military operations and the constant probability of air raids with consequent damage to industrial as well as military establishments demanded wide and quick interchangeability of paint supplies. Performance specifications for coatings were inadequate to insure complete interchangeability, so manufacturers, formerly with competitive formulas, co-operated with governmental agencies to produce military coatings on standard formulas.

Lanolin, as a by-product of the British wool industry, was used in camouflage and other emergency paints of low-drying requirements. Fluorescent paints were reasonably successful in signs and markers for guidance during blackouts. Temporary identification markings for aircraft and other purposes were permanently soluble in gasoline for easy removal.

Palaontology

Invertebrate Palaontology.—Judging by number of publications, invertebrate palaontology was steadily expanding in volume and scope until the outbreak of World War II. In 1939, more papers were published and probably more persons were engaged in palaontological studies than ever before. From 1937 through 1939 about five-sixths of the publications recorded studies in eight countries which, in order of importance of their contributions, were: United States, the U.S.S.R., Germany, Great Britain, France, Australia, Italy and Japan. The remainder was produced in 25 or more other nations. The relative position was similar to that prevailing in previous periods except for the greatly increased importance of soviet palaontology.

The United States led the world in research published from 1937 to 1946. It exceeded every other nation in importance of its work in most of the broader fields of palaontology and was particularly outstanding in the study of Tertiary and pre-Carboniferous faunas and in micro-palaontology. Soviet research equalled or excelled U.S. research in the Carboniferous and Permian, and both France and Germany exceeded the United States in Mesozoic studies. Although the rate of U.S. publication fell off after 1939, the decline was slight compared to the other principal nations, but research lagged behind publication.

The great strides made by the soviets in science were nowhere more obvious than in invertebrate palaontology. Almost all soviet palaontologists belonged to a post-revolutionary scientific generation; they had advanced rapidly from an insignificant to a commanding position. After the German invasion, soviet publication declined greatly and steadily but not as rapidly as might have been expected. Continued government support of palaontology indicated a far-sighted policy, probably equalled in no other country, recognizing the indispensable aid of this science in solving problems encountered in the rapid expansion of mineral industry.

Germany and France had long held important positions in invertebrate palaontology which were maintained until the outbreak of war. Thereafter their publications declined rapidly in number and importance and by 1943 practically ceased.

English and Australian publications declined after 1940 to about one-half of their prewar volume but continued to appear fairly steadily at the latter level.

Japanese publication increased steadily in the later pre-war years. The number of Italian publications was somewhat smaller but, in general, of greater importance. Both nations practically ceased publishing after they entered the war.

A very serious loss to palaontology, not yet fully assessed, was incurred by the destruction of museums in western Europe. These housed many famous and important collections, some of which were scattered, damaged or lost.

Most research in invertebrate palaontology conducted between 1937 and 1946 was systematic, and most publications were descriptive. Some studies were biopalaontological, but few of the world's great faunas were adequately known and much more basic data had to be collected before such studies were likely to achieve wide significance.

Finer discriminations were made between species and

genera, and the tendency increased to raise various groupings in taxonomic rank. Old species were raised to genera and subdivided, and old genera became subfamilies or families composed of numerous new genera. New groups were based on differences not always clear-cut or easily observed, and identification became increasingly difficult so that many groups now required the attention of specialists.

Classification of several important groups, in categories above genera or families, was broken down by new discoveries. Generally accepted classification did not exist or was recognized to be more or less unsatisfactory for most of the invertebrate phyla. Newly proposed classifications were built on supposedly phylogenetic lines and mostly ignored the consideration of practical usefulness. Basic data were too few at the end of the decade, however, to indicate most phylogenetic lines with desirable clarity.

Invertebrate palaeontology during the decade apparently was in an advanced stage of its descriptive development, but interest in biometric, ecological, bionomic and biogenetic fields was evident and increasing. (See also *GEOL. OGY.*) (J. M. Wr.)

Vertebrates.—A revised edition of A. S. Romer's *Vertebrate Paleontology* in 1945 provided a readable, profusely illustrated account of the evolution of the vertebrates. G. G. Simpson's *Tempo and Mode in Evolution* achieved a stimulating synthesis of palaeontology and genetics; it was particularly valuable for the attention it focused on the probability that short periods of rapid and profound evolution in comparatively small populations led to the emergence of the vertebrate classes. This work took its place with other syntheses (Theodosius Dobzhansky, Ernest Mayr, J. S. Huxley) that reflected an active trend toward integration of various sciences in the endeavour to obtain a better understanding of evolutionary processes. The second part of Hans Böker's *Comparative Biological Anatomy* appeared during the decade. Böker's method should exert considerable influence on vertebrate palaeontology, his theoretical outlook not affecting the usefulness of his approach. In the field of methodology, Simpson and Anne Roe's *Quantitative Zoology*, illustrating the application of statistical techniques to zoological and palaeontological problems, and a series of studies by J. A. Kälin on basic comparative anatomical methodology may be cited.

The view that the earliest fishes were provided with an extensive dermal armour, rather generally accepted, regarded the lampreys, hag fishes and even *Amphioxus*, as degenerate descendants of once-armoured ancestors. E. I. White's account of *Jaymoyti*, an unarmoured, primitive member of the Agnatha from the late Silurian, suggested the possibility that not all forms went through a bony stage. The classification of all fishes remained in a state of flux. Contributions to knowledge of the jawless fishes, class Agnatha, were made by E. H. O. A. Stensiö and Anatol Heinz. G. M. Robertson and T. S. Westoll did not regard the lateral fields in the Osteostraci as electric organs. D. M. S. Watson greatly clarified the conception of the primitive jawed fishes (Placodermi) by his thorough account of the acanthodians. Other contributors included Stensiö, Heinz, Tage Nilsson, D. H. Dunkle and J. A. Moy-Thomas. The relations of the Placodermi to the Agnatha on the one hand and to both the classes Chondrichthyes (sharks and allies) and Osteichthyes (bony fishes) on the other were as yet quite uncertain. Stensiö and

Westoll sharply contrasted the Placodermi with other primitive fish groups and, among the placoderms the acanthodians with the Arthrodira, Antiarchi, etc. The same authors discussed the origin of paired fins, modifying some views of W. K. Gregory and H. C. Raven and Walter Gross. Moy-Thomas showed that the two main lines of development within the shark class are the Selachii and the extinct Bradyodonti, Holocephali being a probable offshoot of the latter. Much was done on the ray-finned fishes (Actinopterygii) by James Brough, Hermann Aldinger, Moy-Thomas, Westoll, D. A. Rayner, R. T. Wade, A. S. Woodward, Eigel Nielsen and others. The old, orderly succession of the subclass from chondrosteans to holosteans to teleosteans was broken down. The Holostei, and Brough's "Sub-Holostei," now appeared to be unnatural groupings composed of independent offshoots from palaeoniscoid complex. Romer, Westoll, C. Forster-Cooper, Stensiö, Gunner Säve-Söderbergh, Moy-Thomas, Bobb Schaeffer, Erik Jarvik and others contributed to the knowledge of the fishes of the group Choantichthyes and of their relations to the Tetrapoda. The ancestry of the Amphibia appeared to be in the crossopterygian family Osteolepidae, and the separate origin of the salamanders from the lungfish group (Nils Holmgren, Säve-Söderbergh) was discounted.

During the decade, it was possible here and there to fill the apparent gaps between the quite distinct groups of amphibians and reptiles, and thus suggest closer relationship between them. This came about partially with the discovery of new faunas in new territories, e.g., a Permian fauna in the U.S.S.R., that seemed to be intermediate between the Clear Fork of Texas and the *Tapinocephalus* zone of South Africa. This fauna included mammal-like *Deinocephalia*, which filled the structural gap between the pelycosaurs and the sphenacodonts of Texas and the titanosaurs and the tapinocephaloids of South Africa.

But it was not merely the discovery of hitherto unknown faunas that greatly widened the knowledge of fossil amphibians and reptiles; of equal importance were numerous efforts to further knowledge of previously discovered faunal assemblages, to subject individual groups to monographic review and to deepen the foundation upon which phylogenetic relationships could be suggested by comparative morphological studies. Foremost among the monographs on individual groups were the review of the *Pelycosauria* (Romer and L. I. Price), R. S. Lull and Nelda Wright's unarmoured, *Hadrosaurian Dinosaurs of North America* and C. W. Gilmore's *Fossil Snakes of North America*.

For the interested nonspecialist a noteworthy, semi-popular "vertebrate palaeobiology" was prepared by E. H. Colbert, written around the attractive topic dinosaurs, hence its name *The Dinosaur Book*. It gives interesting back-stage information on general palaeontological study-methods and pictures the dinosaurs against the impressive background of the history of vertebrate evolution. S. P. Welles reviewed the long-necked plesiosaurs of North America and reviewed the order as a whole. A comparative study by C. L. Camp on the osteology of the *Mosasauroidea*, based on California forms, included much needed information on cranial anatomy, especially of the brain-case.

Significant faunal studies of the Permo-Triassic period include Friedrich von Huene's of the fauna of the southern Gondwanaland, that of the Permo-Triassic beds of the U.S.S.R. (J. A. Efremov), of Madagascar (Jean Piveteau) and of East Greenland (Säve-Söderbergh). Although 20

years of extensive excavation had passed, Bernhard Peyer's *Fauna der Tessiner Kalkalpen* appeared far from completion. These and other studies brought forth a great many interesting forms, among them a Permian frog from Madagascar (Piveteau, Watson), *Dvinosaurus*, a neotenic stegocephalian (A. P. Bystrow) and several Labyrinthodonts from Spitzbergen, Greenland and the U.S.S.R. (Säve-Söderbergh, Efremov, Bystrow). Among reptiles should be mentioned *Venjukovia*, a forerunner of the dicynodonts (Efremov), *Deinocephalia* and *Pareiasaurs* (A. P. Hartmann-Weinberg), *Kotlassia*, a seymourid (Bystrow), *Stahleckeria*, a Triassic Brazilian dicynodont (Romer and Price) and *Paranothosaurus*, the first nearly complete, articulated specimen of a large *Nothosaurus*-like sauropterygian (Peyer). Interesting new turtles included a pleurodiran (*Podocnemis*) and two thalassemyids from the late Cretaceous of Arkansas, (K. P. Schmidt), a Miocene *Macrochelys* (Rainer Zangerl) and others (F. M. Bergounioux, C. W. Gilmore). A few additions were made to the growing list of Tertiary and late Cretaceous Crocodilia (C. C. Mook, Kälin and others). Redescriptions of previously poorly known forms based on additional materials were equally as significant as new discoveries; only a few can be mentioned. H. G. Sawin studied the braincase of *Eryops*. Colbert described new materials of the genus *Hypognathus*, a procolophonid from the Triassic of New Jersey; the protorosaurian genera *Prolacerta* from the early Triassic of South Africa (Camp), *Macrocnemus*, a short-necked form close to *Tanystropheus* from the marine middle Triassic of Switzerland (Peyer) and *Trilophosaurus* from the late Triassic of Texas (J. T. Gregory) were subject to thorough redescription. L. D. Boonstra's work expanded knowledge of the *Deinocephalia* and *Bauriamorpha*, and White's of the osteology of *Seymouria*; E. C. Olson worked on the comparative cranial morphology of the therapsids and mammals, F. R. Parrington studied the tooth replacement in theriodonts, Nilsson wrote on the anatomy of the lower jaw in primitive amphibia from Spitzbergen, Schaeffer studied the structure of the tetrapod foot and Gregory suggested *Pareiosauria* as possible ancestors of the turtles.

Birds remained the least well represented vertebrate type in the palaeontologic record. No outstanding discoveries were made during the decade. Samuel Schaub recorded a probable ostrich relative in the Eocene of Europe. Alexander Wetmore, L. H. Miller, Hildegard Howard and H. I. Fisher described North American Cenozoic birds, and Angel Cabrera, Lucas Kraglievich and Bryan Patterson published work on the South American phororhacoids. Carl Wiman and Tilly Edinger discussed the Madagascan *Aepyornithes*.

In Simpson's *The Principles of Classification and a Classification of Mammals*, the classification was carried to genera, and succinct resums were given of each order and higher group. Mammalian history now dated essentially from the Jurassic, removal of the *Tritylodontoidea* to the *Reptilia* (C. C. Young, Oskar Kuhn, Watson) leaving only a few dubious mammals of uncertain affinity to represent the class in the Triassic. W. D. Matthew's monograph on the earliest Palaeocene faunas established two basic divisions of the placentals—the carnivore-ungulate group and the insectivore—bat-primate-edentate group. Recognition of the fact that animals so different as the modern carnivores and hoofed mammals are descended from a common stock constituted one of the major triumphs of palaeomammalogy. Simpson formalized these two divisions as the cohorts *Ferungulata* and *Unguiculata* and added two more—*Glires* (rodents and rabbits) and

Mutica (whales).

These four grand divisions remained distinct as far back as they could be traced.

Much was written and discovered bearing on the ancestry of man and his near relatives. Although perhaps a majority of students, (e.g., Gregory), inclined to the belief that man and the great apes evolved from the mid-Tertiary dryopithecine group, authority could be cited (e.g., Robert Broom) for a belief that the human line was independent of the anthropoid for a much longer period of time. Much was added to knowledge of the African australopithecines by Broom's discoveries in South Africa. These forms were more apelike than manlike in skull structure but more manlike than apelike in the dentition and in the few known scraps of the skeleton. It was uncertain whether these forms were Pliocene or Pleistocene in age. If Pleistocene, they were very evidently not on the direct human ancestral line.

New discoveries of *Pithecanthropus* in Java by G. H. R. von Koenigswald, studied by Franz Weidenreich, emphasized the practical identity of this form and Peking man (*Sinanthropus*). Truly gigantic hominids were described by Weidenreich from the Pleistocene of southeastern Asia. Additional information on Neanderthal man was made available, particularly by Sir Arthur Keith and T. D. McCown. Discovery of scanty remains indistinguishable from those of modern man in deposits of penultimate or Great Interglacial age at Swanscombe, England, suggested that the species went back at least as far as mid-Pleistocene. Chronology and correlations of Pleistocene deposits received considerable attention (Friedrich Zeuner, H. L. Movius, Jr.).

As regards palaeogeography, the evidence afforded by the Mammalia appeared to favour the view that during the Cenozoic era the relations of the continents were essentially the same as in the contemporary period. South America was isolated from early to late Tertiary, and North America and Eurasia were periodically united by a land connection at Bering strait. The evidence from earlier eras was much less complete. Close similarity of North American and European Palaeozoic faunal assemblages lent some support to the hypothesis of continental drift (Westoll, Romer), but this was not yet conclusive. The discovery of *Bothriolepis*, a Devonian fish, in China (C. C. Young) and the occurrence of Permian reptiles similar to those of South Africa there and elsewhere in the far east, suggested the possibility that the faunal assemblages in question may have been world-wide in distribution, thus requiring no great geographical changes to account for their distribution.

Advances in vertebrate palaeontology during the decade were numerous and far reaching. It was encouraging to reflect that these advances had taken place despite the fact that during more than half of the period under review the world was suffering from the most destructive war in history.

Palaeobotany.—The following areas of palaeobotanical investigation received particular attention during the decade 1937-46:

Microfossils as Indices in Stratigraphy.—Many kinds of spores and pollen grains reflecting the vegetation of the period occur as isolated bodies in shales, clay, peat and coal. Appropriate masceration methods free these microfossils for investigation. Thus pollen spectra or the statistical analysis of the microfossils of various coal deposits, for instance, may be used as an aid in the identification and correlation of coal seams of both the Palaeozoic and Mesozoic and apparently to later deposits of various kinds. The evidence indicated that many, if not all, coal seams possess a recognizable difference in microfossil content by means of which specific deposits might be recognized. Many microfossils were described, figured and classified into genera and species, but their proper assignment to the specific plants which bore them was not generally possible at the end of the decade, particularly when dealing with older horizons. In studies of later deposits (Tertiary and after) in addition to other types of plant remains, microfossils were generally used as an aid in interpreting problems of distribution, succession and ecology of fossil plants and their relationships to modern floras.

Studies emphasized potential difficulties of interpretation based on pollen analysis such as misidentification of critical specimens, distortion of size or structure due to masceration methods, preservation differences of various spores, inadequate sampling methods, etc. The recognition of these and additional problems and the development of techniques for their solution represented significant advances.

Palaeoecological Method.—The study of past floras based on ecological concepts and methods (palaeoecology) presented new possibilities in the interpretation of the occurrence, composition and migration of fossil floras and the closely related problems of climate and topography. The palaeoecological method continued to depend upon an accurate knowledge of modern plants which might then prevent incorrect inclusion within fossil floras of species incompatible with the other members of the group from the point of view of climate or distribution. In correcting the single greatest source of error—the misidentification of fossil plants—it was found to be necessary not only to become familiar with similar plants in the modern flora, but also to identify diagnostic differences between plant parts which were in general quite similar.

Relative abundance of species in a fossil flora increases the significance of the list, but numerical dominance alone may give a false picture, as it is influenced by such aspects as the size and shape of the leaf, its ability to withstand destruction, the deciduous nature of the plant and its distance from the place of deposit. It was found that the nature and general conditions under which a fossil flora lived could best be estimated by a study of conditions in which an ecological equivalent flora exists. Estimates as to temperature, precipitation and topography based on this approach appear to have been more soundly proposed.

Palaeobotanical Techniques.—Techniques in the preparation of plant fossils for most efficient study received considerable attention. Refinements of J. Walton's nitrocellulose "peel" method and critical comparisons of these peels with thin ground sections of the same petrification indicated the value of the nitrocellulose peel in securing close serial sections and was in general satisfactory if checked against an occasional thin rock section. Added experience in the masceration of coal and peat and in the use of various synthetic resins as mounting media for

spores, peels and thin sections was gained. Brief experience in the use of dyes in the differentiation of tissues of petrified plants indicated the need for further investigation of its possibilities, as did the use of infra-red photography in the elucidation of structure of opaque compressions. A most useful technique was the substitution of the wire-cutting technique for sectioning small petrifications or when the critical area of a petrification might be destroyed by the kerf of the usual lapidary diamond or carborundum saw.

Fossil Algae.—Although the preservation of fossil algae from the pre-Cambrian and older Palaeozoic was often such that definite determinations had been difficult, the general effect of researches was to strengthen the certainty of the algal nature of many of the described forms. Carroll Lane Fenton in 1946 placed the older algae into five families with the probable earliest occurrence: Cyanophyceae, pre-Cambrian; Chlorophyceae, lower Cambrian; Phaeophyceae, Ordovician; Nematophyceae, Silurian; Rhodophyceae, Ordovician, or if the stromatolites or spongiostromes are accepted as algae, then back to the Archean.

The Charophyta, represented in fossil form by the characteristic oogonia and occasionally by antheridia and fragments of the plant body, were classified by Raymond E. Peck in 1946 into four families: Syncidiaceae, Devonian and Mississippian; Trochiliscaceae, Devonian and Mississippian; Clavatoraceae, Upper Jurassic and Lower Cretaceous; Characeae, Pennsylvanian and after. The value of fossil algae as ecologic indicators was presented with the suggestion that they might well be considered an additional aid in palaeoecology.

Fossil Bryophytes.—The record of fossil Bryophytes in the older periods remained scanty. Tom M. Harris (1939) in describing from structure a new liverwort, *Naiadita lanceolata*, from the British Rhaetic as possibly allied to the modern *Riella*, listed but four species of hepatics from the Palaeozoic and four from the Mesozoic in which the structure of both thallus and rhizoid was known. The record for mosses during the Palaeozoic is even less extensive. William C. Steere (1946) in summarizing North American Bryophyta of the Mesozoic and Cenozoic listed the following genera with their geologic range: *Hepatites*, Triassic, Jurassic; *Metzgeriites*, Jurassic; *Marchantites*, Lower Cretaceous, Eocene; *Sphagnum*, Upper Cretaceous; *Muscites*, Upper Cretaceous, Miocene; *Jungermannites*, Upper Cretaceous-Miocene; *Palaeohypnum*, Eocene, Miocene; *Plagiopodopsis*, Miocene; *Polytrichites*, Miocene. This list indicated the incompleteness of the record. The evidence did, however, indicate a continuous evolution of the Palaeozoic groups through the Mesozoic and Cenozoic and after.

Among many other general areas of investigation of note the following may be listed: (a) the notable expansion of the early vascular flora of the Lower and Middle Devonian; (b) the structure and reproduction of Coal Measure plants elucidated by many papers based on studies of petrified plants obtained from "coal balls," especially from the collections from the Eastern Interior and Mid-Continent coal deposits of North America and (c) the critical consideration of Cenozoic floras as a foundation for modern plant geography. Palestine

The Class "A" mandate of Palestine, under Great Britain as administrator, was approved by the League of Nations in July 1922. Palestine is bordered by Lebanon and Syria to the north, Syria and Transjordan to the east, Egypt (Sinai peninsula) to the south and the Mediterranean sea to the west. Its area is 9,193 sq.mi. The administrative center is Jerusalem. Tabulation of the population of the main cities is as follows:

	1942	1945
Jerusalem	142,800	150,000
Tel Aviv	142,200	170,000
Haifa	114,000	125,000
Jaffa	85,000	95,000
Gaza	27,400	29,000
Nablus	21,500	25,000
Hebron	21,500	25,000

The Mandate recognized three official languages: English, Arabic and Hebrew. Arabic is the spoken language for about two-thirds of the population. Jews, however, use German, Polish, Yiddish or other European languages as their home language while Hebrew is stressed in educational institutions. Almost no Arabs know Hebrew, and few Jews speak Arabic freely. There are small Armenian (4,000) and Greek communities who speak their national languages in addition to Arabic.

Islam of the Sunni sect is the religion of almost 1,000,000 Arabs. But there are numerous small sects, such as the Shia'h (about 5,000), the Druze (11,000) and the Bahai (450). The more orthodox Jews are members of the Mizrahi and the Agudath Israel organizations, but all shades of Reformed and Liberal Jews exist side by side with members of socialistic political parties such as Poale Zion and Hashomer Hatzair, which consider religion merely a phase of cultural development. Practically every sect of Chris-

tianity has its representatives in Palestine.

Official statistics showed the following population changes:

	1939	1944	1946 (est.)
Arab Moslem	927,000	1,064,000	1,100,000
Jew	446,000	525,000	600,000
Christian	117,000	136,000	140,000
Others	12,000	14,000	14,000
Total	1,502,000	1,739,000	1,854,000

British high commissioners during the decade 1937-46 were: Sir Arthur Wauchope (1935-Feb. 1938); Sir Harold MacMichael (March 3, 1938-Oct. 30, 1944); Lord Gort (Oct. 31, 1944-Nov. 7, 1945); Sir Alan Gordon Cunningham (after Nov. 8, 1945).

Peel Partition Plan.—On Aug. 27, 1936 King George V had empowered a royal commission headed by Earl Peel to study and make recommendations concerning the situation in Palestine. But so fierce was the violence there that it was mid-November before they arrived. They found "two nations warring," separated by a wide gulf difficult to bridge. There had been four previous "Arab revolts," in 1920, 1921, 1929 and 1933 but the fifth, which began in April 1936 and ended with a truce on Oct. 12, had been the most intense. The basic causes of all the revolts had been the same: viz, (1) Jewish immigration which threatened eventually to inundate the Arab majority and (2) Jewish land purchases which might alienate their lands forever. Discrimination by Jews against Arab labour was an added irritant. Because the Jew was highly subsidized from outside, and decisions were imposed upon the Arab against his will, the Arab had resorted to violence, all other means having failed to halt the tide of incoming Jews. The rise of naziism in Europe had accentuated the rush of Jews to Palestine, causing a rapid fundamental change in the composition of the country's population, economy and political situation. A comparison of statistics for the years 1919 and 1936 shows what changes had occurred:

Year	Arab Moslem	%	Jews	%	Christian	%
1919	515,000	80	65,300	11	62,500	9
1936	900,000	64.3	400,000	28.5	100,000	7.2

Leaders of the Jewish Agency for Palestine in their headquarters at Jerusalem in 1943. At the extreme right is the chairman, David Ben-Gurion, a Pole

Jewish-held land had doubled, and solidly Jewish cities had appeared. Immigration had accelerated from a few thousand a year to 61,854 in 1935. David Ben-Gurion, chairman of the Jewish agency executive, proclaimed at the World Zionist congress in Lucerne in Aug. 1935 that the Zionists had plans to bring in 5,000,000 Jews in the next ten years. Other Jewish leaders, especially Vladimir Jabotinsky, leader of the Revisionist party, demanded a revision of the borders of Palestine to include all of Trans-Jordan in the anticipated Jewish commonwealth. Two incidents also exposed large-scale smuggling of modern arms from Europe to Jews. All these had combined to make the Arab national struggle far more than a local problem. The Jews interpreted the Balfour declaration to mean that they had unlimited rights to migrate to Palestine and to make it "as Jewish as England is English or France is French." In his memorandum on British policy issued in 1922, Winston Churchill had expressly denied any such interpretation.

After two months of intense study, the Peel commission returned to the United Kingdom and on July 7, 1937, published its voluminous findings. Because of its main recommendation, it became known as the Peel Partition plan. It suggested division of Palestine into three sections: (1) A Jewish state roughly consisting of northern Galilee and the coastal plain starting northward at Tel Aviv; this was to contain 300,000 Jews and 200,000 Arabs. (2) A mandated enclave including the holy places of Nazareth, Jerusalem and Bethlehem with a corridor to Jaffa. (3) An Arab state including all not delineated above, which would be united to Trans-Jordan. A transfer of populations would subsequently exchange Arabs with Jews so as to form solid racial blocs within the respective states. On July 7 the house of commons resolved to bring the proposal before the League of Nations. On July 8 the Arab Defense party rejected the plan and demanded a cessation of Jewish immigration, of land sales to Jews, a termination of the mandate and recognition of an Arab sovereign state. The Arab states were unanimously opposed to the plan. Jewish groups were split, some favouring "half a loaf" rather than none, but the World Zionist congress expressed the view that it was contrary to the Balfour declaration. A pan-Arab conference held at Bludan, Syria on Aug. 11 set up a permanent organization to combat political Zionism which they denounced as a tool of British imperialism. Amidst mounting tension a band of Arabs ambushed the British commissioner for Galilee, Yelland Andrews, on Sept. 26. His assassination precipitated the most acute phase of the "Arab rebellion."

There were in existence four types of "armies": (1) British empire troops who numbered almost 30,000 before the end of 1937; (2) legally-armed dominantly Jewish police and gendarmerie augmented by from 3,000 to 5,000 supplementary police who acted as a local militia; (3) illegally-armed Jews belonging to two organizations and numbering possibly 50,000. The larger organization later became known as the Hagana (Defense) and was passive in nature at that time. Its purpose was to hold off raids until assistance from legal forces might arrive. The smaller, more compact aggressive "army" was the military branch of the Revisionist (New Zionist) party under the leadership of Jabotinsky. Later to be called the "Irgun Zvai Leumi," this force was organized on fascist principles, operated underground and numbered from 3,000 to 4,000. (4) The largest was composed of illegally armed Arabs who were partially armed, financed and trained by Arabs

from abroad. Most notable of the latter was Fawzi-ed-Din al Kawukji, a Syrian pan-Arabist who had fought the Turks, earned a Legion of Honour from the French as an intelligence officer, then in the Druze Rebellion of 1925 had fought the French and was condemned to death by the latter. He escaped to Saudi Arabia and later volunteered in the Iraq army from which he resigned in 1936 to take up the "Arab struggle" as leader of the guerrillas in north Palestine. The Arab arms were nondescript and their organization loose.

On Oct. 1, 1937, the British struck at the Arab Higher committee, exiling most of its members to the Seychelles Islands. Haj Amin Al Huseini, the Grand Mufti, who was chairman, took asylum in the Holy Mosque and on the 16th, eluding guards, he escaped to Jaffa, thence proceeding up the coast in a small boat, to Beirut. Outrages and pitched battles broke out all over Palestine. Arabs primarily attacked the British but often vented their rage on Jews. Revisionists carried the war to the Arabs, setting delayed-action bombs in Arab theatres and markets. On Jan. 4, 1938, the British postponed approval of the Peel plan and assigned a new commission under Sir John Woodhead to formulate a specific program to implement the plan. It made a study of three possible plans of partition and eventually declared them all unworkable. This the Arabs boycotted. On March 3, the new high commissioner, Sir Harold MacMichael, arrived but the "war" intensified. Although they had suffered great casualties, the Arabs put forth their greatest effort in October, capturing several cities including Bethlehem and the old city of Jerusalem. They were recaptured by the British on the 10th and 18th respectively. This marked the weakening of Arab resistance. Leaders of neighbouring Arab states had been urging conciliation for months. Also an extremely mobile military force, unorthodox in method, well disciplined and developed by the brilliant but eccentric British Zionist, Orde Wingate (Brigadier Wingate was killed in Burma in 1944) had trapped and liquidated many of the Arab guerrilla leaders. Arab finances and arms were nearing exhaustion. Official figures for 1938 stated that 77 British, 255 Jews and 503 Arabs were killed with 216, 390 and 598 respectively wounded. But the Arabs hid many of their casualties, which must have been nearly double those figures.

"White Paper" of 1939.—Two factors combined to cut down Jewish immigration. In 1937, Benito Mussolini had openly challenged the British position in the Mediterranean while the revolt had retarded economic development. Only 10,536 immigrants entered in 1937 and 12,868 in 1938. Britain's world position demanded that Palestine should be quiet. To formulate policy a conference was held in London Feb. 7 to March 17, 1939, to which both Arabs and Jews were invited. But in spite of offers of outside mediators, neither Jews nor Arabs would accept British suggestions. One tangible result was the belated publication of the controversial McMahon-Husein correspondence of 1915-16 on which the Arabs based their original claims. Following further deliberation, the British on May 17, 1939, issued a "White Paper." It reiterated that the Balfour declaration had never envisaged conversion of Palestine into a Jewish state against the will of the Arabs. It recommended that within the next ten years, both Jews and Arabs be systematically promoted in responsible positions so as eventually to form a Palestinian state; that Jewish immi-

gration be limited to 75,000 over the next five years and subsequently conditioned upon Arab acquiescence and, thirdly, that land sales to Jews be restricted. The Land Transfer Regulations of 1940 authorized freedom for Jews to buy land in the zones where Jews were most numerous, limitation by licence in the zones where Jews were a minority and prohibition in regions almost solidly Arab. The White Paper policy was approved by the two houses on May 22-23, but a majority of the League of Nations Mandates commission questioned the validity of the White Paper recommendations. Arabs tacitly accepted the policy as a hopeful move but never approved of it officially. But the White Paper was the *bête noire* of Zionists, inasmuch as the freezing of immigration doomed Jews to a permanent minority of only one-third of the population. It was considered a death sentence to hopes of Jewish statehood.

World War II Ends Strife Temporarily.—War in Europe brought peace to Palestine. The high commissioner appealed to all factions to forget their differences, and the great majority agreed. But there was one exception. A tough nucleus of Jabotinsky's "army" was led by Abraham Stern, graduate of the Hebrew university and later the University of Milan. From Italy he brought back indoctrination in the "black-shirt" technique of organizing cells of terrorists. Once he had been captured by the police but was released in a general amnesty in 1939. To him and his followers, Italian fascism was less of a danger to the goal of a Jewish state than was the British empire. Jabotinsky died in 1940 and his organization fell apart, the political branch continuing under the leadership of Dr. Arie Altman, while the "army" split into the Irgun Zvai Leumi under Polish refugee leadership, and Stern, who carried about 400 "commando" personnel with him, calling themselves "Fighters for the Freedom of Israel." To finance their crusade, they levied heavy assessments on Jewish individuals and institutions, using bombs or kidnapping as persuasion in case there was hesitation. Even a high-ranking Jewish police official was murdered for interfering with their methods of extortion but in 1942, Stern was trapped and liquidated while most of his lieutenants were imprisoned—for a short while.

Other groups co-operated well with the British, especially after the fall of France in June 1940. Small Jewish units served with the British army in the campaigns in Iraq, Syria and the desert in 1941. There was a great deal of agitation for the organization of a Jewish army, enthusiasts arguing that 200,000 could be recruited in the United States alone, but the British did not act until 1944, when a Jewish brigade was trained in Egypt. This was not popular with the Jews and recruits failed to complete the 6,000 expected. The unit saw action the last week of the war on the north Italian front. Eventually about 25,000 Jews were recruited in various British formations, such as the transport service and the royal air force. About 9,500 Arabs volunteered. Naturally Palestinian economy expanded with the war. Immense contracts were let to supply the British 8th and 9th armies. As the Jewish community was far better prepared industrially, it received the lion's share of the accompanying prosperity. The greatest damage came to the citrus fruit industry, whose markets were cut off by the war.

Limitation of Jewish immigration into Palestine added to the terrors of anti-Semitism in Europe and resulted in the phenomenon of "illegal" or "unauthorized" immigration. Jews were encouraged to escape from Europe on obsolete boats, veritable deathtraps, which sailed for Palestine without quota assignments. At first the British tried to turn back some of these ships or transport the immi-

grants to other places, such as Mauritius, but later they were allowed to land their passengers and have them charged against the quota. Two tragedies occurred in the meanwhile. In Nov. 1940, the "Patria" was tied up at the Haifa dock, loaded with 2,000 deportees. Zionist sympathizers decided to prevent the sailing and scuttled the ship, but it capsized and drowned 252 of the refugees. In Dec. 1941, the S.S. "Struma" left a Black Sea port and was detained in the Dardanelles, then on Feb. 23, 1942, was ordered back to the port of sailing. An explosion sank the overloaded vessel the next day with a loss of 700 lives. Underground methods of smuggling in Jews continued throughout the war, estimates varying between 4,000 to 6,000 a year.

In 1942 there was a large-scale effort to enlist the influence and wealth of the 5,300,000 Jews in the United States in the Palestine cause. David Ben-Gurion, chairman of the Jewish agency executive, toured the country and presented his recommendations to the U.S. Zionists assembled in New York. On May 11 they approved his "Biltmore program" which repudiated the White Paper policy, for the first time called for the recognition of a Jewish commonwealth and a Jewish army, urged that responsibility for immigration be vested in the Jewish agency and restated the necessity to co-operate with the Arabs. Many Jews in Palestine opposed the Biltmore program. The left-wing parties, Hashomer Hatzair and Poale Zion, and some moderates were alarmed by its scope, but the Revisionists and the Jewish agency succeeded in having it endorsed by a committee of the general council of Zionists on Nov. 10, 1942. In the U.S.A., resolutions favouring Zionist goals were presented to state legislatures and pushed in both houses of congress, most of them being passed in routine manner. Lest it immobilize Allied forces in the middle east, the senate resolution was finally delayed because of military considerations, in anticipation of the invasion of France.

Thefts of arms became notorious during 1943. In the spring, two British army deserters were given large sums of money and all the necessary forged countersigned documents to steal lend-lease arms by the truckload. Apprehended later, they indicated that two Jews had suborned them. In September a trial was held which made clear that some large Jewish organization with vast ramifications within the British army was at work. Only one bullet was recovered. The Jew in whose home the bullet, along with pads of British army requisition blanks, was found, received a prison sentence. The two Britishers and two Jews they implicated were also given prison terms. All the Jews were later released.

At the same time, the Polish army was in training in Palestine. Because of strong traditional anti-Semitism in Poland, about 3,500 Jews within the Polish ranks seized the opportunity to desert, often with arms. They were quickly absorbed by the Jewish community. Searchers for the deserters were impeded, and a non-co-operative attitude was adopted by the settlers. In late 1943 this resulted in violence in two cases at the settlements of Hulda and Ramat Ha Koveshe and an attitude of hostility between Zionists and the government became noticeable.

Rise of Jewish Terrorism.—In Dec. 1943 there were two jail breaks by which the interned leaders of the Stern group escaped. Early in 1944 both the Stern group and the Irgun Zvai Leumi began a series of attacks on the British. The former shot to kill, while the latter indulged in blasting government installations, often trapping police

Samaritans, one of the world's smallest ethnic groups, observing Passover ceremonies atop Mt. Gerizim, Samaria, in 1946

inside. Leaflets were frequently distributed, attempting legally to establish these "armies" as underground forces of liberation operating against the oppressor nation, Britain. On Aug. 8 an attempt was made to assassinate the high commissioner by ambushing his car, but it failed. Two members of the Stern group, using British uniforms, went to Cairo and on Nov. 6 shot Lord Moyne, British minister of state in the middle east. The murder was defended as an act of patriotism. As the tempo of outrages increased, responsible Jewish leaders decried the methods adopted by extremists but declared that they could not discipline them. Meanwhile the Arab league was being formed, and although the various Arab parties showed little sign of general co-operation, they all approved of Musa El Alami to represent Palestinian Arabs at the Alexandria conference which met in late Sept. 1944. Following the Yalta conference in Feb. 1945, at separate sessions President Franklin D. Roosevelt and Prime Minister Churchill met the various heads of the Arab states in Egypt where the problem of Palestine was discussed. After the meeting, Abdul Aziz Al Saud, king of Saudi Arabia, wrote a long letter to President Roosevelt outlining the Arab claims, to which the president replied that he would take no action in regard to Palestine without consulting the Arabs. The letter, dated April 5, was published on Oct. 18 and raised a storm of criticism among Zionists.

That the end of the war in Europe would bring trouble to Palestine had been prophesied by Ben-Gurion as early as March 20, 1943. In a speech made at Tel Hai, he ex-

horted Jewish youth to prepare themselves for the fighting which would fall to their lot at the end of the war. This "war" was to start over the question of immigration. It began when the White Paper quota of 75,000 Jewish immigrants had been exhausted. Late in 1945 the British announced that they would continue to authorize a quota of 1,500 a month despite Arab protests. But Zionists ignored any legal quotas and in Dec. 1945 there emerged a highly organized pattern of illegal immigration from ports in southern Europe. Operated clandestinely, boatloads of Jewish refugees would approach the shore at night. A spearhead of Jewish "commando" troops would clear British shore patrols from a selected stretch of beach and attempt to escort the passengers ashore. Numbers of British police were killed in these actions. Attempts to follow the attackers to the Jewish settlements met with resistance, and more deaths followed. Following Dec. 1945 there were widespread and frequent raids upon the railways, train robberies, attacks upon British posts by Jews dressed in British uniforms and dynamiting of government installations.

Palestine was the focal point upon which converged a number of world forces. First in magnitude was the pressure engendered by the appalling nazi plan which had eliminated 75% of European Jewry. The remaining 1,500,000 Jews constituted a pool of potential immigrants to other countries. But no other country indicated an interest in taking these refugees while the Zionists redoubled their efforts to channel them all toward Palestine. Zionist spokesmen presented but failed to place on the agenda of the United Nations in May 1945 a program urging a joint agreement by the great powers to impose their will upon the Arabs by recognizing a Jewish state at once, formally declaring the Jewish agency as the provisional government of that state, granting an international loan to transfer to and settle the first 1,000,000 Jews in Palestine, collecting reparations from Germany for the reconstruction of Palestine and establishing international facilities for the transit of all Jews who wished to settle in Palestine. This maximal program was adopted by the World Zionist conference meeting in London in Aug. 1945.

Anglo-American Committee.—On Aug. 31, President Harry S. Truman wrote to Prime Minister Clement Attlee suggesting that 100,000 Jews be admitted at once to Palestine to alleviate the situation in Europe. Though this was refused, Attlee suggested the formation of a Joint Anglo-American committee to study the entire problem and make recommendations. This was done, and a commission of 12 spent the winter in Europe and the middle east, producing their report on April 20, 1946.

The first recommendation of the Anglo-American committee stated that no country other than Palestine gave hope of substantial assistance in finding homes for refugee Jews. Wherefore the second recommendation was that 100,000 certificates be issued at once for displaced Jews to enter Palestine, in 1946 if possible. The third recommendation denied the exclusive claim of either Jew or Arab to a state in Palestine, while the other seven recommendations, though of equal importance, were lost sight of in the clamour that arose over the second.

The Arab leaders were becoming alarmed. They met in Jerusalem in Nov. 1945 and reconstituted the Arab Higher committee. The kings of Egypt and Saudi Arabia met in Feb. 1946. Almost simultaneously, the British announced a decision to recognize the independence of Trans-Jordan. Zionists protested this vigorously, claiming that the separation of Trans-Jordan in 1923 had been a violation of the Palestine promises made to the Jews.

Declarations pro and con were issued, but on May 25, 1946, the British proclaimed the Amir Abdullah ibn Husein of the Hashemite family as king of Trans-Jordan. At the same moment, five representatives of rulers of the Arab states were meeting at an estate of King Farouk in Egypt. They issued a communique declaring that the Arab states could under no circumstances accept the recommendation of the Joint committee and called for a special session of the Arab league to meet at Bludan, Syria, early in June. At this session, joint answers were drafted to the United Kingdom and the United States, and plans were made for measures which would "preserve the future" of the Arabs in Palestine. During the last days of the conference, the news that the Grand Mufti had "escaped" from France electrified the Arab world. His travels had taken him to Beirut (1938-40), Baghdad and Tehran (1941), then to Rome and Berlin (1941-45) from where his voice had often been heard over the axis radio, finally to France (1945-46), then back to Cairo, where he sought asylum on June 19, 1946. Other interned Arab leaders had been released after the surrender of Japan.

Following the publication of the Joint commission report, Jewish "terrorist" forces had announced that they would cease their attacks if recommendation two were implemented at once. The position of the British Labour government was a complicated one. In Dec. 1944, in its

Jerusalem pedestrians scrambling for cover after the explosion of land mines in the King David hotel (here obscured by smoke) on July 22, 1946. The mines were planted by the Irgun Zvai Leumi and resulted in 91 deaths

election platform, the Labour Party had introduced a plank favouring a Jewish commonwealth in Palestine and encouraging "the Arabs to move out as the Jews move in." Two years later, overburdened with the commitments of the post-war world, the British were favouring the freedom of the Arabs in Syria and Lebanon; they were negotiating to withdraw troops from Egypt, promising independence to Trans-Jordan and trying to soothe the Arabs in Iraq. Thus, while all around Palestine their policy was to encourage Arab sovereignty, within Palestine they were being called upon to implement their campaign promises of inundating the Arab population by unlimited Jewish immigration—beginning with 100,000 in 1946. Irrked by mounting criticism (especially from U.S. Zionists), which was echoed by political leaders anxious to get the support of Jewish votes, Ernest Bevin at a Labour conference on June 12 heatedly declared that the question of transferring 100,000 Jews "tomorrow" involved (1) an extra division of security forces and (2) financial demands approximating £200,000,000 (\$800,000,000); he said that New York, from where most of the criticism came, did not seem to want any more Jews there. This proved to be the cue for an unprecedented series of acts of sabotage in Palestine. Jewish "underground forces" destroyed bridges, cut communications, murdered five British officers in their billet in Tel Aviv and kidnapped six others who escaped or were later released. The Palestine government under Sir Alan Gordon

Cunningham, high commissioner after the resignation of Lord Gort in Nov. 1945, suspected that the Jewish agency was implicated in the wave of organized destruction. On June 29, 1946, he threw out a dragnet throughout the Jewish community, including a raid on the Jewish agency. Three thousand suspects were detained, including three members of the agency executive itself. Meanwhile, it was announced in Washington that President Truman had appointed a cabinet committee to formulate a joint program with the British on the recommendations of the Anglo-American committee.

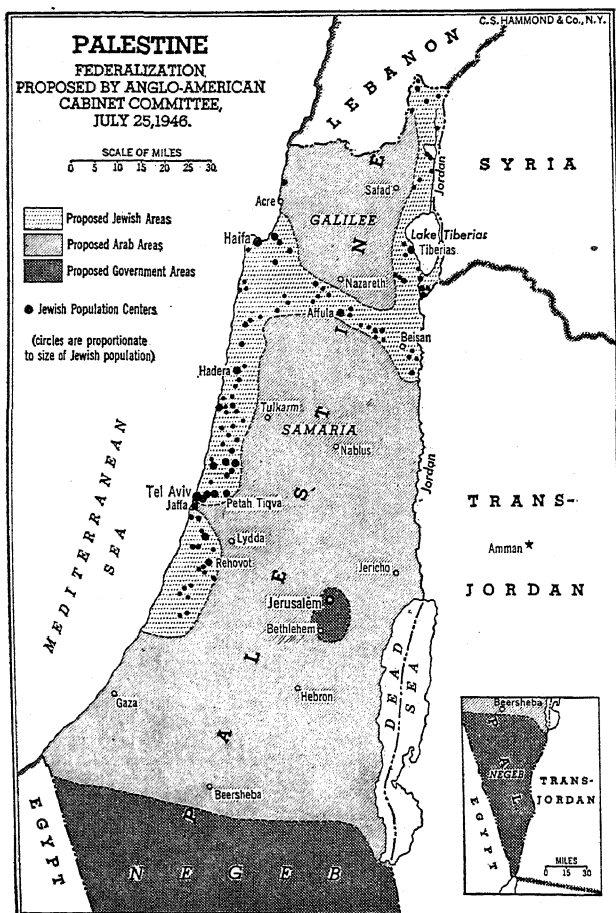

The Thorny Immigration Problem.—To Zionists and Arabs, the immediate problem was the question of awarding certificates for the 100,000 Jewish immigrants. The Zionists felt that if that number could be introduced into Palestine within the year, the White Paper policy would be officially dead and the door would be opened to unlimited immigration in the following years. Then they might attain a majority within another ten years and establish a Jewish state. The Arab states concentrated on defeating this move, unanimously criticized U.S. meddling in Arab affairs, threatened to renew the "Arab national struggle" and hinted that they would take the case before the United Nations. For if they could stop large scale immigration, the Arabs hoped that Jewish pressure would decrease as conditions in Europe became more normal. Then the high birth rate of the Arabs, equalling a natural increase rate of 2.7% per year as compared to the Jewish rate of 0.92%, could guarantee their predominance indefinitely. Meanwhile, efforts were being made to use economic sanctions by boycotting Jewish-made goods and

establishing Arab offices in London and Washington to combat Zionist propaganda.

On July 22, 1946, at noon, a group of 18 members of the Irgun entered the kitchen of the King David hotel in Jerusalem, placed milk cans loaded with gelignite inside and then set the fuse. On the six floors above were offices of the Palestine government and the army. The ensuing explosion was the most disastrous in the history of Palestinian terrorism. Over 90 people, including many senior officials, were killed outright or suffocated in the ruins of the building. The Irgun boasted of its deed while other Jewish groups quickly disassociated themselves.

On July 25 the joint committee in London tentatively agreed to a complex solution, involving a division of Palestine into four provinces: (1) A zigzag strip of land, 20-30 miles wide, running from the north down both sides of the Jordan, then up the Valley of Jezreel to Haifa and down the coast to a point 40 miles south of Tel Aviv, comprising 1,500 sq.mi. in total area, would be granted as a Jewish province. This would be 16% of the whole of Palestine but it would be 90% of the best agricultural land; although it contained 405,000 Jews and 300,000 Arabs, it would be capable of quickly absorbing 100,000 Jewish emigrants if financially assisted from abroad. (2) A British enclave would include the holy cities of Jerusalem and Bethlehem, where the central government under British control would be located. (3) The Negeb or southern triangle in the Sinai desert touching upon Aqaba would remain under British control. (4) The rest, including the Arab city of Jaffa, would be an Arab province but bisected by the Jewish province. Within these areas, there would be a large degree of autonomy but the central government would reserve rights to final authority on currency, security immigration and other general features of government. It was recognized that the Arab province was not viable and would need a subsidy to maintain its population of 900,000 Arabs. Large sums totalling hundreds of millions of dollars would be necessary to finance the scheme over a period of years. Participation of the United States was considered essential to implement the plan. The plan was immediately denounced by all Arab spokesmen. On Aug. 3, the Jewish agency, meeting in Paris, rejected it. It became known that President Truman was dissatisfied with the idea. It appeared that the British would have to revise the plan radically or shoulder it alone.

During the first days of Aug. 1946, British troops carried out the most detailed search of Tel Aviv yet attempted. Several members of the "underground" army were seized, large caches of arms were discovered (one in the basement of a synagogue), and copies of orders were found which the British government claimed incriminated certain members of the Jewish agency executive. The flood of unauthorized refugees coming by sea doubled and trebled. On Aug. 7 the British announced that "illegal" immigrants, approximating 7,000, would be sent to camps in Cyprus. Spokesmen for the Jewish agency proclaimed that no Jew entering Palestine could do so "illegally"; any "illegality" would be involved only in efforts of the British navy to stop them. From various sources the proposal was heard that the Palestine mandate was too heavy a burden for the British to bear and that it should be given to a larger organization, such as the United Nations. In the loud cacophony of conflicting claims and counter claims, that of the Zionist organization was most widely and frequently heard. Its basic message reiterated that the Zionist movement constituted a sovereign state which had a moral authority to rule Palestine regardless of legality, British rule or Arab

majority. As Britain and the United States embroiled themselves more hopelessly in the complexities of the case, a new question was asked. Would the soviet union exploit Anglo-U.S. conflict and difficulties in the middle east to expedite soviet policy in this vital area? The Zionists strained to hear some encouragement from Moscow, but nothing of value was forthcoming. The Arabs hinted that if invoked the Kremlin would intervene in their behalf. One thing was obvious: No group was happy, none secure and no solution would be satisfactory to all.

On Sept. 9, 1946, representatives of the Arab states met the British government in London. The Jews refused to attend the conference unless the basis of discussion should be recognition of a Jewish state. After two weeks, a stalemate had been reached, but there were rumours that some form of partition was agreeable to most of the moderates. (See also MANDATES.)

Palmyra Island

See PACIFIC ISLANDS, U.S.

Panamá

Southernmost republic of Central America, Panamá is bounded on the west by Costa Rica, on the north by the Caribbean sea, on the east by Colombia, on the south by the Pacific ocean. It is bisected by the Canal Zone, under perpetual lease to the United States. Area, 28,575 sq.mi., exclusive of the Canal Zone. Pop. (1940 census), 631,637; a later estimate was 635,836. The capital is Panamá city, situated at the Pacific terminus of the canal (pop., 1940 census, 111,893); other important cities are Colón, at the Atlantic end of the canal (pop., 44,393); David (9,222), Chitré (4,790), and Santiago (4,253). The population is concentrated especially in the neighbourhood of Panamá city and Colón. Population density for the entire country, by the census of 1940, was 22.10 per sq.mi. The racial distribution was estimated at 58% mestizo, 17% of European descent, 15% Negro and 9% Indian.

The constitution of March 1, 1946, established a unitary government headed by a president elected by direct, popular vote for a four-year term, to be succeeded, in order, by two vice-presidents, similarly elected for an equal term; a legislative branch consisting of a unicameral national assembly, members popularly elected for four-year terms; a judiciary headed by a supreme court of justice of five members appointed by the president. Presidents

during the decade 1937-46 included Juan Demóstenes Arosemena (1936-Dec. 16, 1939); Dr. Augusto S. Boyd (Dec. 16, 1939-Oct. 1, 1940); Dr. Arnulfo Arias (Oct. 1, 1940-Oct. 7, 1941); Dr. Ricardo Adolfo de la Guardia (Oct. 9, 1941-June 15, 1945); Enrique A. Jiménez, after the latter date.

(R. H. FN.)

Arosemena Opposed.—The year 1937 was marked by an atmosphere of dissatisfaction with the administration of President Juan D. Arosemena, who had taken office the previous year. The Liberal parties supporting the administration of Harmodio Arias, Arosemena's predecessor, had chosen as their candidate Domingo Díaz, who had acquired a large popular following after another Liberal candidate, Enrique A. Jiménez, had given up his candidacy for the sake of party unity and had decided to support Díaz. President Arias, however, was determined to prevent by all means the election of Díaz. A new party called National Revolutionary was hastily formed for the specific purpose of launching and supporting Arosemena. Heads of this party were the president's own brother, Arnulfo Arias, whom he had appointed minister of public works, and the secretary general to the presidency, E. Fernández Jaén. The election showed a clear majority for Díaz, but the official count had to be announced by the electoral college, of which three members belonged to the Liberal party and two to the Revolutionary party. As the count progressed and it was clearly seen that Díaz had the great majority of the votes, President Arias issued a resolution disqualifying one of the Liberal members, surrounded with armed forces the Cabildo building where the electoral college was sitting, prevented the entrance of the ousted member and seated in his place a substitute pledged to the Arosemena candidacy. The majority thus formed counted returns publicly denounced as fraudulent, sent chiefly from the town of Santiago, and declared Arosemena elected president.

Early in March 1938, a cabinet crisis occurred. President Arosemena accepted the resignation of his secretary of government and justice, and appointed his brother, Leopoldo Arosemena, an engineer, to the post. A so-called "cement-bag" contribution was levied, supposedly to be devoted to public works. While no constitutional authority was claimed for it, official committees were appointed to supervise its collection on the ground that it fostered community spirit. In order to finance the Fourth Olympic Games for Central American and Caribbean nations to be held in Panamá city, the national assembly authorized a special issue of government bonds. An ample stadium and a modern swimming pool were built for the competitions, which took place according to schedule. An agreement was reached with the republic of Colombia, after lengthy negotiations, for the final demarcation of the boundary line. The national assembly approved in three consecutive sessions, without debating it, a boundary treaty with Costa Rica signed on Sept. 26, 1938. This treaty, however, was withdrawn from the Costa Rican congress the following year after considerable political pressure in that country. A new income tax law was enacted, which superseded the one in force since 1932.

Public opinion was considerably aroused at the end of 1939 by the news that the government was about to have a new banking law enacted by the legislature. To packed galleries, Secretary of Finance Jaén, who headed the National Revolutionary party during the absence of Arias in Europe, introduced a bill imposing on foreign banking institutions conditions which made their operations prac-

tically impossible in the country. One bank closed its doors; another, which had enlarged its offices in the Canal Zone, immediately reacted by transferring the largest share of its business to territory under U.S. jurisdiction. When the law was substantially modified a few days later, the banking business which returned to Panamá was only a fraction of its original volume.

After the nationalist victory in Spain's civil war in 1939, Franco's troops broke into the legation of Panamá and forcibly arrested numerous Spaniards who had taken refuge there. Panamá immediately protested the action, and ordered its diplomatic representatives to leave Spain at once.

The general treaty with the United States, amending the Canal convention of 1903 and signed March 2, 1936, by Ricardo J. Alfaro and Narciso Garay as Panamá's plenipotentiaries, was ratified by the United States congress on July 25, 1939, despite strong U.S. army opposition. News of its ratification was jubilantly received in Panamá, as the treaty embodied a considerable number of vital rectifications, for which Panamá had fought unsuccessfully since 1904. Gist of the new pact was that the republic was relieved from burdensome obligations imposed by the unequal treaty of 1903, and that the two countries were to share the benefits and the responsibilities of canal operation. Alongside with the general treaty, two conventions were also ratified on such important matters as wireless communications and the construction of a trans-isthmian highway. Interoceanic communication had heretofore been blocked by an old monopoly granted to the Panamá Railroad company which passed to the United States government in 1904. Notes were also exchanged on several important matters, among them the question of military manoeuvres to be held within jurisdiction of the republic.

After war broke out in Europe, the Inter-American consultation system was inaugurated, and on Sept. 23, the first Conference of Foreign Ministers of American Nations assembled in Panamá city. The so-called Declaration of Panamá adopted by the conference established a neutrality and safety zone 300-mi. wide around the coasts of the American continent, where hostilities were not to take place. Great Britain, France and Germany, after being properly notified through the Panaman foreign office, made plain their objections to what they considered a modification of international law by unilateral action of the American nations. The issue passed a crucial test on the occasion of the naval battle between the German pocket battleship "Graf Spee" and the three British cruisers, "Exeter," "Ajax" and "Achilles," a few miles off the estuary of the river Plate, near Montevideo, Uruguay. On Jan. 4, 1940, the Panaman foreign office received a cabled message from Adolf Hitler to the effect that he had ordered an examination to be made of 21 republics' protest for the "Graf Spee" incident.

Agitation started in the republic during 1939 regarding presidential candidates, and Eduardo Chiari, a prominent lawyer, appeared to have the support of three parties and a strong backing of public opinion. President Arosemena squelched the movement by making Arias the official candidate, whereupon Chiari declined the candidacy offered him.

The Arias Dictatorship.—Shortly thereafter, Arosemena died suddenly of a heart ailment in the town of Penonomé, province of Coclé, on the night of Dec. 16, 1939. He was succeeded by First Vice-President Augusto S. Boyd, who flew from Washington, where he had served as Panamá's ambassador. Ricardo J. Alfaro, who was president in

1931-32, answered the call of the opposition parties and decided to run against the official candidate.

On Jan. 25, 1940, Alfaro arrived in Panamá city to inaugurate his campaign for the presidency in opposition to the official candidate, Arias. An impressive demonstration given him on his arrival was dispersed by platoons of mounted police who charged the crowds; scores of citizens were injured or jailed. In a letter addressed to President Boyd, Alfaro pointed out that acts of violence and intimidation were being carried out by government officials and particularly by the armed forces in behalf of Arias, and demanded constitutional guarantees of free and fair elections.

Under the pretext of smashing a planned coup to overthrow the government, the police force, after arresting leaders throughout the country, made an attempt to arrest Alfaro and his principal followers, most of whom fled to the Canal Zone. On May 31 Alfaro asked his followers to refrain from going to the polls, stating that under the prevailing terrorism no free election was possible. Voting took place in June 1940 with no candidate except Arias, who was declared elected for the four-year term and took the oath of office in the Olympic stadium on Oct. 1. The following day he delivered a radio address which contained threatening references to Washington. Notwithstanding Arias' oath to uphold the constitution, he immediately submitted to the national assembly a draft of a new charter which extended his term of office till Jan. 1, 1947, and superseded *in toto* the constitution of 1904, which could only be amended by two consecutive legislatures. In order to give his own charter immediate effect, Arias had it approved by a so-called "plebiscite," for which only "yes" ballots were printed. Those who voted "no" faced imprisonment for "defacing a public document."

The new constitution was proclaimed for the republic on Jan. 2, 1941. Two justices of the supreme court who had questioned the legality of the Arias charter were ousted. The new constitution gave the executive strong powers and provided an easy method for amendment. It disfranchised Negroes of West Indian origin born in the

country. A general policy of regimentation and intimidation was started which resulted in a thoroughly cowed citizenry. The laws on the nationalization of retail trade were enforced in a high-handed manner through which some of Arias' followers acquired the businesses of ousted foreign merchants at confiscatory prices. Gambling flourished, and numberless slot-machines operated in the cities of Panamá and Colón. An entire colony of Swiss farmers in the province of Chiriqui were shot to death by the police on flimsy pretexts. The pro-axis, anti-Allied sympathies of the Arias regime were shown in several ways, notably in its refusal to allow merchantmen under the Panamá flag to arm themselves for defense against German submarines.

On Oct. 8, 1941, President Arias surreptitiously left the country without asking leave of the supreme court, as required by his own constitution. When his departure became known to the public and to the responsible officials of the government, there was an outburst of the country-wide sentiment against the dictatorship. Vice-Presidents Jaén Guardia and José Pezet resigned, whereupon the supreme court declared the presidency vacant, and Ricardo Adolfo de la Guardia, Arias' minister of government, took the oath of office as president Oct. 9. The fall of the dictator was wildly celebrated. A pro-Allied foreign policy was started, and Panaman merchantmen were permitted to arm for defense. Immediately after the Japanese attack on Pearl Harbor on Dec. 7, Panamá, bound to the United States by treaty relations and by continental solidarity, declared that a state of war existed between Panamá and Japan, even before the United States congress did, and proceeded diligently to round up Japanese nationals. Shortly afterward, war was also declared on Germany and Italy. Switzerland later agreed to represent the interests of Panamá in Germany, Italy and Japan.

Wartime Prosperity.—Owing to the huge military works undertaken for the defense of the canal, an era of unprecedented prosperity dawned on the country in 1942 despite the sudden death of the tourist trade brought about by the war. Studies and preliminary work for a third set of canal locks were also begun. After lengthy negotiations,

Construction work on a camp in Panamá by U.S. "Bushmaster" jungle troops in 1942

an agreement on defense sites was signed in Panamá city between Panamá and the United States. On May 18 an exchange of notes took place in Washington transferring to Panamá the waterworks and sewer systems in the cities of Panamá and Colón built by the United States for account of Panamá and paid in excess by the republic. Another agreement was reached for the transfer to the republic of all city lots in Panamá and Colón which the Panama Railroad company had held in usufruct and which were to revert to the United States government in 1966.

The year 1942 was marked by official visits from President Manuel Prado of Peru (in May) and President Arroyo del Río of Ecuador (December).

Submarine warfare, brought very close to Panaman shores in 1942, considerably decreased the volume of shipping in 1943 and materially increased the cost of living in Panamá. In order to cope with this and other similar problems, Jiménez, who had held important government positions in his long career, was appointed ambassador to Washington. Octavio Méndez Pereira, who had left the country in 1940 upon the election of Arias, returned to Panamá as rector of the university, replacing J. B. Duncan, who resigned after a student strike late in 1942. A congress of ministers of education of the American nations was held in Panamá city. Among the important agreements reached, a convention was signed creating an Inter-American university in Panamá, conceived as a centre of Inter-American studies, to be supported and controlled by all American nations.

Return to Democracy.—In 1944, a commission was appointed by President de la Guardia to prepare a draft constitution to supersede the charter of 1941. The three-jurist body of Alfaro, Chiari and J. D. Moscote presented their draft after considerable study and intensive work. Political unrest, meanwhile, was growing because of the struggle between friends of De la Guardia, who proposed that no election of vice-presidents be held until 1947, and a number of assemblymen, very close to a majority, who meant to elect another person in his place. In this situation the parties supporting the administration, urged President de la Guardia to declare the self-evident illegality of the constitution of 1941, to dissolve the assembly, and to call a free and fair election by virtue of which the legitimate representatives of the Panaman people, acting as a constitutional

convention, should give the nation a charter which represented the will of the people. De la Guardia acted accordingly, whereupon the opposition assemblymen went to the Canal Zone and on a spot near the border pretended to elect three vice-presidents. As they had no popular backing, this gesture failed to have any effect on the people of Panamá. De la Guardia set up a so-called "Cabinet Government," formed by members of all the parties supporting the constitutional movement. This government proceeded at once to take the necessary steps to carry out the election of a constitutional convention, and De la Guardia announced his decision to give up his powers on June 15, 1944, the day on which the convention should elect a provisional president to succeed him. In 1945 Foreign Minister Roberto Jiménez, Alfaro and Pereira were appointed to represent Panamá at the United Nations conference on international organization in San Francisco.

After intense campaigning, the elections of 1945 were held in an orderly manner, and an honest count was made with the result that a constitutional convention was elected in which a large majority went to the Liberal parties. The constitutional assembly proceeded to elect Enrique A. Jiménez as provisional president on June 15, when he took the oath of office. The convention proceeded at once to discuss the draft prepared by the three-jurist commission. A cabinet representing all parties supporting the adminis-

§1939.

tration was appointed by President Jiménez with Carlos Sucre in the ministry of government and Alfaro in the foreign office. The government authorized the return of Arias to the country. Arias was noisily welcomed by his followers, but on Dec. 22, 1945, an attempt to capture the police headquarters in Colón resulted in the deaths of several policemen and assailants. The government discovered connections with similar plots in Panamá city, for all of which the Arias' political machine appeared responsible. As a result, Arias and a number of his followers were jailed. The constitutional assembly set Jiménez' term of office to Oct. 1, 1948, and on March 1, 1946, the new constitution was solemnly proclaimed. Following proclamation of the country's third constitution, the assembly became a legislative body for the passing of ordinary statutes. The new constitution was characterized as thoroughly democratic and liberal. Its social and labour provisions were highly advanced; a civil service system was established and retail business was reserved to Panaman citizens, but without affecting foreign interests already established. A students' strike to oust the minister of education was unsuccessful. The most significant political fact was the unification of all the Liberal factions into a single party, an achievement largely due to the efforts of President Jiménez and Francisco Arias Paredes, a prominent leader who died July 31, 1946. (See also CENTRAL AMERICA.) (E. A. Jz.)

Too wide for the Panama canal, this floating dry dock was upended and floated through on its side in 1945, a manoeuvre devised by the U.S. naval civil engineers corps

Panama Canal and Canal Zone

The Panama canal, one of the world's most important artificial waterways, links the Pacific and Atlantic oceans through the Republic of Panamá. It is 40.27 mi. in length between shore lines and 50.72 mi. between deep water on either side. The canal is constructed through the ten-mile-wide strip known as the Panama Canal Zone, the use, occupation and control of which were granted by the newly established Republic of Panamá to the United States by treaty on Nov. 18, 1903. Area of the Zone is 553.12 sq.mi., of which 190.94 sq.mi. are water area. Population of the Canal Zone in the spring of 1945, exclusive of U.S. army and navy personnel, was 44,688. Figures for the earlier years of the decade were: 1937, 28,707; 1938, 29,063; 1939, 28,978; 1940 (16th census), 51,827; 1941, 42,346; 1942, 55,481; 1943, 57,390; 1944, 47,775. The abnormal figures of 1940 and later were caused by the importation of large numbers of labourers for army, navy and canal work.

Children in the Panama canal zone playing outside one of the air raid shelters constructed there in 1942. Note the misspelling of "MacArthur"

Employees of the canal and the Panama railroad (the latter owned and operated by the U.S. government and built through Zone territory from Panamá city to Colón) are classified as "gold" or "silver," depending on whether they are skilled craftsmen, executives, or professionals or, on the other hand, unskilled or semi-skilled workers. Distribution of employees during the decade (June of each year) was as follows:

	1937	1938	1939	1940	1941	1942	1943	1944	1945
Gold	3,418	3,386	3,052	5,258	7,260	8,550	8,357	6,974	6,685
Silver	10,159	10,413	11,246	18,891	25,994	28,686	26,293	23,040	24,347

The terms "gold roll" and "silver roll" originated during the construction period of the canal from the practice of paying the two groups in gold and silver respectively. The classification was continued, although U.S. currency became the medium of payment for all employees. Some complaint, reputedly stimulated by radical political elements in the Republic of Panamá, arose over alleged discrimination between the two groups of employees.

The Canal Zone administration performs many services for employees and their families, many of whom live in the cities of Panamá or Colón, both under the jurisdiction of the Republic. Panamá merchants frequently complained of the competition and lower prices provided by the Zone commissaries. Commissary net sales during the years 1937-

45 were as follows: 1937, \$8,113,112; 1938, \$8,518,242; 1939, \$8,897,317; 1940, \$12,291,266; 1941, \$19,755,188; 1942, \$35,421,764; 1943, \$46,948,042; 1944, \$39,220,427; 1945, \$38,134,704.

The Panama Canal Act of Aug. 24, 1912, and subsequent acts and executive orders prescribed the civil government of the Canal Zone. Governmental functions were assigned whenever possible to departments established for the operation and maintenance of the canal. The Panama railroad is a separate corporation but operates in close relationship with the canal. In addition to the offices of both the railroad and the canal at Balboa Heights, just outside of Panamá City, the railroad maintains an office in New York City and the canal an office in Washington, D.C. Governors (also presidents of the Panama railroad) during the decade were: Brig. Gen. Clarence S. Ridley, Aug. 27, 1936-July 10, 1940; Maj. Gen. Glen E. Edgerton, July 11, 1940-May 15, 1944; Maj. Gen. J. C. Mehafeff, after May 16, 1944. Governors are customarily chosen from the engineers' corps, U.S. army.

Operation of the canal was fundamentally affected after the outbreak of World War II in 1939 and especially after U.S. entry into the war in Dec. 1941. Extraordinary measures of precaution for the safety of the canal were taken upon the outbreak of war, although details of many such measures were not released. With the entrance of the United States into the war the amount of tolls-free traffic enormously increased. Law and treaty provisions established exemption for all U.S. naval and other government vessels, all Panaman government vessels and all Colombian war vessels. Gov. Mehafeff pointed out in his report for 1945 that if tolls-free vessels had been assessed at prescribed rates, an additional revenue of \$13,000,000 would have accrued to the treasury.

Transits and Revenue, Panama Canal, 1937-45

Year ending June 30	Number of transits	Net tonnage	Tolls	Tons of cargo	Total revenues
1937	5,387	25,430,000	\$23,102,137.12	28,108,375	\$24,163,569.42
1938	5,524	25,950,383	23,169,888.70	27,385,924	24,130,140.18
1939	5,903	27,170,007	23,661,021.08	27,866,627	24,487,615.85
1940	5,370	24,144,366	21,144,675.36	27,299,016	22,329,609.85
1941	4,727	20,642,736	18,157,739.68	24,950,791	19,474,896.14
1942	2,688	11,010,004	9,752,207.38	13,607,444	10,726,003.55
1943	1,822	8,233,999	7,356,684.94	10,599,966	8,916,167.14
1944	1,562	6,073,437	5,456,163.32	7,003,487	7,266,533.67
1945	1,939	8,380,959	7,243,601.58	8,603,607	8,930,555.06

The U.S. congress, by an act approved Aug. 11, 1939, authorized construction of a third set of locks parallel to, but at some distance from the existing locks at Gatún, Pedro Miguel and Miraflores, the existing locks of by-pass channels to connect with the existing canal and other necessary works at a cost not to exceed \$277,000,000. This action followed crystallization of discussion over whether the existing locks should be enlarged, a third set built, a sea-level canal constructed or a Nicaragua canal built. Excavation was begun July 1, 1940, and prosecuted vigorously until May 1942 when, on orders from the secretary of war, work was largely suspended to bring the project into closer conformity with the over-all war program. Dredging in the approach channels was continued on a reduced-priority basis, but other work was postponed. The original project called for an estimated 30,800,000 cu.yd. of "dry" excavation, 31,100,000 cu.yd. of "wet" excavation, 4,900,000 cu.yd. of concrete, 20,400 tons of re-enforcing steel, 86,000 tons of machinery and metal work and approximately 6½ mi. of new channel 42 to 46 ft. in depth. Gov. Mehafeff early in 1946 asked the U.S. congress to authorize a new \$1,500,000 survey oriented to future needs of both defense and shipping. The house of representatives

on Nov. 26, 1945, unanimously passed a bill providing for a governmental investigation of the vulnerability of the canal to atomic bombs and of the possible rebuilding of the canal. John G. Claybourne, superintendent of the canal's dredging division, in an address to the American Civil Engineering society on Jan. 16, 1946, urged the "streamlining" of the canal and construction of a sea-level channel because of bomb danger. Serious geological and engineering objections were advanced from other sources against that proposed solution, however. Capt. Miles P. DuVal, U.S.N., for four years captain of the port of Balboa and author of a book on the canal, suggested construction of a major artificial lake on the Pacific side of the continental divide (as a counterpart to Gatún lake on the Atlantic side) and the subsequent removal of the single-step Pedro Miguel lock at the narrow outlet of Gaillard Cut, combining all Pacific-side locks into one structure as at Gatún.

Panama Conference, 1939

See PAN-AMERICAN CONFERENCES, 1937-46.

Pan-American Conferences, 1937-46

The number and variety of inter-American conferences continued to grow rapidly during the decade 1937-46. Of 241 official conferences held or scheduled to be held between 1826 and the end of 1946, all but 54 had met since the end of World War I. The number in the period 1937-46 was more than 100. These conferences may be divided into two kinds: political and technical or special. The political conferences may be subdivided into two groups, the regular series of "Pan-American conferences" (of which the eighth was held in Lima, Peru, in 1938 and the ninth was scheduled to be held in Bogotá, Colombia, in 1947), and the restricted conferences convened for consideration of more specialized (but politically important) problems. Of the latter, the Inter-American Conference on Problems of War and Peace (Mexico City, Feb.-March 1945) was an example. The special or techni-

cal conferences may be subdivided into a wide variety of kinds, depending upon the subject matter considered. They usually had a more limited appeal and participation and were considered by the general public as more routine in character; frequently, however, they were very important in terms of further improvement of administrative and other interrelationships of the hemisphere or a portion of it. Perhaps the outstanding such conference during the decade was the Eighth American Scientific congress at Washington in May 1940. Almost every field of organized human activity crossing national boundaries was represented at the end of the decade by some inter-American discussion in the form of official congresses or conferences. These were in addition to many such meetings held under private auspices and with no governmental connection.

Lima Conference.—The Eighth International Conference of American States met at Lima, Dec. 9-27, 1938. It continued the practice of holding these large diplomatic gatherings at five-year intervals, which had begun with the Fifth Pan-American conference at Santiago, Chile, in 1923. Because of the imminence of war in Europe and especially because of the Munich conference which had led to the partition of Czechoslovakia, the Lima conference assumed unusual importance in the popular and official estimation. All 21 republics of the hemisphere were represented at Lima, many of them by their foreign ministers and other outstanding diplomats; United States delegates included Secretary of State Cordell Hull, Alfred M. Landon (1936 Republican presidential candidate), unofficial representatives of organized labour, the Catholic Church and other interests. The conference was characterized by an unusual spirit of cordiality and compromise, although in order to get unanimity of agreement many proposed stands had to be modified to much less significant form. The conference adopted 111 resolutions and recommendations covering a wide variety of matters; it followed the unusual procedure of not drafting any treaties or conventions, partially as a means of avoiding the delay and risk involved in submitting them to constitutional ratification in the various states. The most important action taken was the adoption of the "Declaration of Lima" in which the 21 states reaffirmed and expanded the position taken at the important special conference at Buenos Aires in 1936 in asserting "continental solidarity," and their intention to "collaborate in maintaining the principles upon which it

Delegates in session at the Rio de Janeiro conference where on Jan. 23, 1942, all the American republics pledged adherence to a resolution which recommended severing diplomatic relations with the axis nations

is based" and to defend those principles "against all foreign intervention and activity that may threaten them." A threat against the peace, integrity or security of one republic was a threat against all, the conference asserted. The conference provided for international consultation in case of future critical situations.

Foreign Ministers' Conferences — Panamá, 1939. — The first such occasion for consultation came with the German invasion of Poland, Sept. 1, 1939. The first "Meeting of the Ministers of Foreign Affairs of the American Republics" was quickly convened on the invitation of the government of Panamá (Sept. 23–Oct. 3, 1939). The organization and discussion were more informal than in a full-dress conference, but the meeting was of the greatest significance, not the least because it represented a unanimous and collective approach to the problems of the moment that would have been unthinkable 25 years earlier. The most dramatic action of the conference was the adoption of the "Declaration of Panamá" by which a neutrality or security zone was established within the ocean waters from 300 to 1,200 mi. outside the continental limits south of Canada for the purpose of attempting to prevent belligerent action in such waters. The zone policy did not work well, chiefly because of the impossibility of enforcing it, and little was heard of it after the first few months; its most spectacular violation came in the famous "Graf Spee" incident off Montevideo in Dec. 1939. Perhaps the most important accomplishment of the Panamá conference was the creation of certain continuing administrative agencies, especially the Inter-American Financial and Economic Advisory committee and the Inter-American Neutrality Committee.

Preliminary session of the Inter-American Conference on Problems of War and Peace in Mexico City on Feb. 21, 1945; Ezequiel Padilla (centre) addressing delegates. Argentina was not invited, but later accepted the conference's Act of Chapultepec, pledging mutual aid against aggression

Havana, 1940.—After rapid wartime changes in the spring of 1940, culminating in the fall of France, the second foreign ministers' conference was held at Havana, Cuba, July 21–30, 1940. The important question of the moment was the imminent threat of transfer of French, Dutch and possibly even British territorial possessions in the new world to German control. As at the 1939 meeting, the agenda included a variety of questions under the rubrics of neutrality, protection of peace and economic co-operation. Probably the most important action of the conference was the adoption of a convention and the "Act of Havana," both dealing with territorial transfers. Both were designed to set up machinery, the act temporarily and the convention permanently, for the exercise of a collective trusteeship or "provisional administration" by the republics of the Americas over European possessions in the hemisphere in case change of control should be irregularly attempted. Changes in the course of the war obviated invocation of the machinery, but the action represented a new high in development of inter-American political co-operation on a realistic basis. The conference also adopted, among other actions, a broad statement of policy dealing with economic co-operation.

Rio de Janeiro, 1942.—The involvement of the United States and other American republics in the war led to the holding of the third foreign ministers' conference, Jan. 15–28, 1942, at Rio de Janeiro. This conference was concerned with establishment of a common hemisphere

policy toward the war. After much diplomatic manoeuvring, caused especially by the reluctance of Argentina and Chile to go the full distance urged by some of the Middle American states, the conference agreed to a recommendation of the severance of diplomatic and commercial relations with aggressor nations by the American republics. A majority of the 21 republics had already either declared war on or broken off relations with the axis powers. The conference recommendation was followed immediately by several other severances of relations; Argentina and Chile remained the only American republics not then taking that step. The Rio conference changed the name of the Inter-American Neutrality committee to the Inter-American Juridical committee and enlarged its functions. An incidental but important action of the conference was the mediation that resulted in the settlement of the century-old boundary dispute between Ecuador and Peru.

Special Conference at Mexico City.—The surprise request of the Farrell-Perón government in Argentina in Oct. 1944 for a fourth foreign ministers' conference to consider the relations of the republics of the hemisphere with Argentina led, after protracted diplomatic conversations, to a declination of that request but also to the holding of a specially organized Inter-American Conference on Problems of War and Peace (Mexico City, Feb. 21–March 8, 1945), which, by-passing the regular consultative machinery, permitted the omission of Argentina. The Mexico City (sometimes called the Chapultepec) conference adopted 61 resolutions, recommendations and declarations. Probably the most important was the "Act of Chapultepec," in which, after listing the principles underlying the inter-American system, the conference pledged the signatory states to consult together during the war, on collective measures of diplomatic, economic, or military restraint against aggression from within or without the hemisphere. The inclusion of domestic aggression was highly significant; previous Latin-American fear of U.S. intervention had prevented any such approach, but the nature of the contemporary Argentine regime tended somewhat to shift that fear toward Argentina. The Act of Chapultepec also recommended a post-war permanent treaty embodying similar procedures but with the stipulation that any regional arrangements of the sort must be in harmony with plans for international organization soon to be worked out at the United Nations conference at San Francisco. The Mexico City conference also took steps to remodel the machinery of the inter-American system by providing that regular international conferences should be held at four-year intervals, foreign ministers' meetings each year, the chairmanship of the governing board of the Pan American Union should be rotating, a permanent inter-American economic and social council should be created, etc. Argentina, though not represented at the conference, subsequently adhered to the Act of Chapultepec.

A conference to translate the procedures of the Act of Chapultepec into permanent treaty form was originally planned for Rio de Janeiro for Oct. 1945. Critical political situations in both Brazil and Argentina at that time caused its postponement until March 1946. It was then again postponed until Sept. 1946 and still later indefinitely. (See also INTERNATIONAL CONFERENCES, ALLIED [WORLD WAR II]; INTERNATIONAL LAW; INTERNATIONAL ORGANIZATIONS; PAN AMERICAN UNION.)

Other Inter-American Conferences.—A chronological list of the official inter-American conferences held or scheduled to be held in the period 1937–46 follows. Data are limited to subject matter, number of the conference if in a series, place, and date.

- Neuro-psychiatry, 1st, Santiago, Chile, Jan. 4–11, 1937.
- North American regional radio, Havana, March 15–29, 1937.
- South American regional radio, 2nd, Rio, June 7–20, 1937.
- History, 2nd, Buenos Aires, July 5–14, 1937.
- Coffee, 2nd, Havana, Aug. 9–19, 1937.
- Education, 3rd, Mexico City, Aug. 22–29, 1937.
- Technical aviation, Lima, Sept. 15–25, 1937.
- Radio, 1st, Havana, Nov. 1–Dec. 13, 1937.
- Tuberculosis, 4th, Santiago, Chile, Dec. 15–18, 1937.
- Endocrinology, 1st, Rio, July 1938.
- Sanitary, 10th, Bogotá, Sept. 4–14, 1938.
- Eugenics and homoculture, 3rd, Bogotá, Sept. 4–14, 1938.
- Friends of education, 1st, Buenos Aires, Sept. 12–17, 1938.
- South American botanical, Rio, Oct. 12–19, 1938.
- Municipalities, 1st, Havana, Nov. 14–19, 1938.
- Middle American regional radio, Guatemala City, Nov. 24–Dec. 8, 1938.

Pan American Union

In 1937 the American republics were in the process of re-enforcing and consolidating their international organization in anticipation of the climactic world events that were already then shaping. The Seventh International Conference of American States, held at Montevideo in 1933, together with the Buenos Aires Peace conference in Dec. 1936 and the Eighth International conference at Lima in 1938, resulted in positive contributions in revitalizing the Pan American movement and in strengthening the whole system of international relations in the western hemisphere.

The collective work of the continent at these three meetings was supplemented by the actions and policies of individual governments. The beneficial effects of the good neighbour policy enunciated by President Franklin Delano Roosevelt in 1933 were already evident. The acceptance by the United States of the principle of "nonintervention in the internal or external affairs of other states"; the modification of the policy of recognition; the reinterpretation of the Monroe Doctrine, returning it to its original basic principles; the abrogation of the Platt amendment with Cuba; the negotiation of a new treaty with Panamá affecting the rights of the United States in the Canal Zone—all served to allay the feeling of suspicion and distrust which had developed in many sections of Latin America. The commercial agreements negotiated with

many of the Latin American countries, under the reciprocal trade agreements program of Secretary Cordell Hull, also contributed to a revival of the international trade and an improvement in the national economies of the respective countries.

Pending questions between different American republics also were settled during this period. In 1938, a treaty of peace between Bolivia and Paraguay brought a definite end to the Chaco War; in the same year a serious controversy between the Dominican Republic and Haiti arising out of certain border incidents that had occurred during the previous year was settled through the application of the procedure of conciliation provided for in the inter-American peace treaties; and in 1942 the boundary between Ecuador and Peru was defined by the terms of the Protocol of Peace, Friendship and Boundaries signed at Rio de Janeiro.

As a result of these multilateral and bilateral measures the relations between the American republics were placed on a more satisfactory basis than they had been for many years. The position of the Pan American Union, official international organization maintained by the 21 American republics to promote closer relations among them, was greatly strengthened. The inter-American system was well equipped to meet the problems created by the outbreak of war in Sept. 1939.

Pan American Union and the War.—At the conferences of Buenos Aires and Lima, the American republics had developed the procedure of consultation whereby, in order to meet any situation that might threaten the peace of the western hemisphere, they would consult together at meetings of their ministers of foreign affairs. The Pan American Union was made the permanent secretariat of these meetings, which it served in the same manner as it had previously served the international conferences of American states.

Immediately following the outbreak of World War II in Europe, the governing board of the Pan American union convened the first meeting of consultation of the ministers of foreign affairs, which met at Panamá from Sept. 23 to Oct. 3, 1939. Two other meetings were called as the international situation developed and the shadow of war drew nearer to the American continent: the second at Havana, Cuba, July 21-30, 1940 and, following the attack on Pearl Harbor, the third at Rio de Janeiro Jan. 15-28, 1942.

To strengthen the military, political and economic defenses of the hemisphere the governing board of the Pan American union organized a number of special agencies, in accordance with recommendations of the meetings of foreign ministers.

Financial and Economic Advisory Committee.—Pursuant to a resolution adopted at the Panama meeting of foreign ministers, the Inter-American Financial and Economic Advisory committee was established at the Pan American union on Nov. 15, 1939. The resolution setting up the committee emphasized the necessity of close co-operation among the American republics to "protect their economic and financial structure, maintain their fiscal equilibrium, safeguard the stability of their currencies, promote and expand their industries, intensify their agriculture and develop their commerce."

The committee, consisting of representatives of the 21 governments, recommended concrete measures to mobilize the economic resources of the hemisphere and to implement the measures of economic control proposed in resolutions of the meetings of foreign ministers. Several special conferences were organized by the committee, one on mari-

time transportation in 1940 and another on economic and financial controls in 1942, both of which met at the Pan American union.

The committee also put into operation a plan whereby vessels that had sought refuge in ports of the American republics at the outbreak of the war were taken over and utilized in inter-American commerce. By this measure, German, Italian, French and Dutch vessels were placed in operation at a time when the need for shipping was greatest. With the conclusion of hostilities the plan was terminated, and each government was left free to make such arrangements as it saw fit with respect to the vessels it had taken over.

Offshoots of the committee were the Inter-American Coffee board, which was set up in 1940 to administer a plan for the marketing of coffee, and the Inter-American Development commission to promote the establishment of new industries in the countries of Latin America.

At the Inter-American Conference on Problems of War and Peace held at Mexico City in March 1945, the Financial and Economic Advisory committee was made permanent under the name of Inter-American Economic and Social council. The council began to function at the Pan American union on Nov. 15, 1945 and, like its predecessor, was composed of 21 members representing the governments of the American republics. It was empowered to co-ordinate all official inter-American economic and social activities; promote social progress and a higher standard of living for all the peoples of America; undertake research and make recommendations to the governments through the Pan American union on economic and social questions.

Inter-American Juridical Committee.—In accordance with a resolution of the Panamá meeting of foreign ministers, the Pan American union in 1939 established the Inter-American Neutrality committee, made up of representatives appointed by the governments of Argentina, Brazil, Chile, Costa Rica, Mexico, the United States and Venezuela.

The committee began to function at Rio de Janeiro on Jan. 15, 1940, and formulated recommendations on matters relating to internment, use of vessels as auxiliary transports of warships, the entry of submarines into the ports and territorial waters of the American republics, a security zone, the inviolability of postal correspondence, telecommunications, and the treatment of the crews of merchant ships suspected of sabotage. The committee also undertook the preparation of a draft convention on neutrality.

Following the entry of the American republics into the war, the name of the Neutrality committee was changed to Inter-American Juridical committee. It was charged with the study of juridical problems created for the American republics by the war, and was also entrusted with duties in the field of codification of international law.

The committee prepared projects and reports on numerous legal subjects, including the juridical status of "war criminals," the recognition of *de facto* governments, the international rights and duties of man, the fundamental principles of international law and a project of an inter-American peace system.

In 1945, the governing board of the Pan American union increased the membership of the committee to ten members, to enable it to carry on more effectively the duties entrusted to it, especially in the preparation of projects for the Ninth International Conference of American States.

Emergency Advisory Committee for Political Defense.—For the purpose of defending the American republics against espionage, sabotage and subversive propaganda, the

governing board of the Pan American union in 1942 set up the Emergency Advisory Committee for Political Defense, pursuant to a recommendation of the Rio de Janeiro meeting of foreign ministers. The committee had its headquarters in Montevideo, where it began to function on April 15, 1942. It consisted of seven members appointed originally by the governments of Argentina, Brazil, Chile, Mexico, the United States, Uruguay and Venezuela. Following the withdrawal in 1943 of the member designated by Argentina, the government of Peru was requested to name a delegate to fill the vacancy.

The establishment of the Emergency Advisory committee constituted an innovation in the organization of international bodies. In formulating the regulations of the committee the governing board of the Pan American union stipulated that its members "shall represent and shall function on behalf of all the governments, members of the Pan American Union." Although appointed by individual governments, the members acted not merely for the governments by which they were appointed, but for the entire community of American states. This was the first instance in the inter-American movement wherein the principle of collective representation was applied to a body of limited membership.

The committee submitted to the governments a series of recommendations of the measures that should be taken to curb subversive activities and to control or eliminate organizations harmful to the security of the American republics. National committees of political defense were set up in the different countries, and regional meetings were held to consider the problems of political defense peculiar to the respective areas.

Inter-American Defense Board.—In the military field, the Inter-American Defense board was established at Washington and held its opening session at the Pan American union on March 15, 1942. It was composed of military, naval and aviation experts appointed by each government, and was entrusted with a study of measures necessary for the defense of the continent.

At the Inter-American Conference on Problems of War and Peace it was agreed that the defense board should continue to function as an agency of inter-American defense until a permanent body is established.

Semi-Centennial.—The year 1940 marked the 50th anniversary of the Pan-American movement and of the founding of the Pan American union at the International Conference of American States held at Washington in 1890. The growth of the Pan American union during that 50-year period reflected in a sense the development of the inter-American system. Organized originally as a commercial bureau charged with the compilation of trade statistics and customs laws and regulations, the scope of the organization was enlarged at successive conferences to include many other activities. In 1902 the Columbus Memorial library was established, and in later years divisions were organized to function in the fields of intellectual co-operation, agriculture and tourist travel.

In 1937 the juridical division was set up to serve as the administrative secretariat of inter-American agencies engaged in the codification of international law, as a depository for the instruments of ratification of Pan-American treaties and conventions, and to undertake studies in the field of jurisprudence.

The division of labour and social information was established in 1940 to compile and disseminate information on all matters relating to developments in the social and la-

bour fields. In that same year a philatelic section was organized to make available to collectors postage stamps of the countries which were members of the Pan American union. In 1941, a division of music was organized to coordinate inter-American efforts in this branch of culture.

In addition to the emergency duties entrusted to it as a result of the war, the Pan American union during the decade 1937-46 continued to carry on the activities for which it was primarily organized. The administrative and technical divisions set up during this period as well as those previously established, continued to make studies in their respective fields and to issue reports which were made available to the member governments as well as to individuals and organizations interested in the American republics.

In 1942, the governing board of the Pan American union approved the provisional organization of an inter-American Institute of Agricultural Sciences, the purposes of which were to encourage and advance the development of agricultural sciences in the American republics through research, teaching and extension activities in agriculture and related arts and sciences. The definitive organization of the institute was provided for in a convention drawn up and opened for signature at the Pan American union on Jan. 15, 1944. Headquarters of the institute were located at Turrialba, Costa Rica. The members of the governing board constituted the board of directors of the institute and appointed its director and secretary.

Postwar Organization.—One of the important resolutions adopted at the Inter-American Conference on Problems of War and Peace at Mexico City in March 1945, was that on the reorganization, consolidation and strengthening of the inter-American system. Many of the provisions of that resolution related to and affected the organization of the Pan American union.

During the first 50 years of its existence the Pan American union did not exercise political authority, and by terms of the resolution adopted in 1928 at the Sixth International Conference of American States it was specifically precluded from undertaking political functions. At the Mexico City conference, however, the powers of the governing board were broadened, and it was authorized to take action "on every matter that affects the effective functioning of the inter-American system and the solidarity and general welfare of the American republics."

The Mexico City resolution also made provision for the appointment of special ambassadors to serve on the governing board. Since the Havana conference of 1928, the member governments could be represented on the board by such representatives as they might wish to appoint, but the practice had always been followed of designating the diplomatic representatives in Washington and the secretary of state of the United States. The Mexico City resolution sought to make the appointment of special representatives obligatory. Several governments, however, objected to the mandatory character of this provision and, following an inquiry directed to the governments by the governing board, it was agreed that governments so desiring might continue to be represented by their diplomatic representatives at Washington or the person they might wish to designate, until the Ninth International Conference of American States was able to give further consideration to the matter. Notwithstanding this modification of the specific terms of the Mexico City resolution, a number of governments appointed special ambassadors to represent them on the board.

The resolution adopted at Mexico City also prohibited any member from serving successive terms as chairman. At one time the secretary of state of the United States was *ex officio* chairman of the board and, although the Fifth International Conference of American States in 1923 provided for annual elections, the representative of the United States had always been elected to the office. On Dec. 5, 1945, in accordance with the Mexico City resolution, the board elected as its first Latin American chairman, the ambassador of Brazil, Dr. Carlos Martins. On his retirement as a member of the board, Dr. Martins was succeeded by the ambassador of Nicaragua, Dr. Guillermo Sevilla Sacasa, and on Nov. 6, 1946, the special ambassador of Colombia, Dr. Antonio Rocha, was elected chairman.

With the organization of the United Nations, the Pan American union also had occasion to consider the question of the relations between the regional and the world organization. The fundamental principles governing these relations were set forth in the charter of the United Nations. On the specific subject of the relations between specialized inter-American organizations and world organizations, the governing board of the Pan American union on Nov. 6, 1946 approved three principles which, it was proposed, should be incorporated in one of the projects on the organization of the inter-American system to be presented to the Ninth International Conference of American States. These principles were as follows: (1) that specialized organizations functioning within the inter-American system should establish the closest co-operative relations with similar world organizations; (2) that specialized inter-American organizations on entering into agreements with international organizations of a world-wide character should maintain their identity and position as an integral part of the inter-American system; and (3) that the governing board should intervene whenever it might deem it necessary in the negotiation of any agreement between specialized inter-American organizations and similar organizations of the world system, in order to preserve unity in the co-ordination of efforts and activities as among those organizations. (See also INTERNATIONAL CONFERENCES, ALLIED [WORLD WAR II]; PAN-AMERICAN CONFERENCES, 1937-46.) (L. S. Ro.)

Pan-Slavism

Various movements for a closer union among the peoples speaking a Slavic language and supposedly of common racial descent were known in the 19th century under the name of Pan-Slavism. In these movements Russia, as the most powerful of the Slav nations, assumed a leading role. In its more aggressive forms, Pan-Slavism became a vehicle of Russian imperial expansion, often proclaimed as the task of liberating the Slav peoples of the Habsburg and Ottoman empires from German or Turkish domination. Before World War I, Pan-Slavism played only a small role in the official policy of Russia. It was largely a movement sponsored by intellectuals who generally regarded the Slav peoples as bearers of a distinct and significant civilization which they believed was characterized by a unique love for peace and by an exalted mission for the pacification and rightful ordering of mankind. The fact that Russia itself oppressed the second and third most populous Slavic nations, the Ukrainians and the Poles, to a degree

hardly equalled by the treatment of Slav peoples in other empires, proved an obstacle to the gospel of Pan-Slavism proclaimed by Russians. Polish intellectuals developed a Pan-Slavism of their own in which they demanded the union of the smaller Slav nations against Russian oppression and against the alleged danger involved in Russian expansion for European civilization.

Some of the Russian writers in the second half of the 19th century foresaw the formation of a Slav bloc under Russian leadership which would include in addition to the Slav peoples themselves, Rumania, Hungary, Greece, Constantinople and parts of Turkey. After the bolshevist revolution, the soviet government, however, rejected all forms of Pan-Slavism. It saw in them a reactionary and imperialist movement. In the then prevailing emphasis on internationalism and on class solidarity, a union based on common racial descent, on ties of blood or on an affinity of language, was unthinkable. Nobody then would have predicted the revival and intensification of Pan-Slavism two decades later and the realization of some of its most far-reaching aspirations.

Soon after the German attack upon soviet Russia in June 1941, a Pan-Slav committee was founded in Moscow which in frequent proclamations summoned all Slavs to fight against the Germans and stressed the racial and cultural community of the Slavs as opposed to Germanism. This new trend had for the first time been officially foreshadowed when Vyacheslav Molotov, the soviet foreign minister, declared on Sept. 17, 1939, at the time that the soviet armies invaded eastern Poland that the soviet government could not remain indifferent to the fate "of our kindred Ukrainians and White Russians inhabiting Poland." Here the international class ideology was replaced, or rather supplemented, by a doctrine of racial brotherhood and solidarity. The soviet press at that time reported the resolutions passed in thousands of spontaneous mass meetings throughout the soviet union declaring that "our sacred duty is to rescue our oppressed brothers." The same justification of racial and national kinship was adduced by the soviet government for the annexation of Czechoslovakia's Carpatho-Ukraine on June 29, 1945.

As the war between Germany and the U.S.S.R. progressed, the emphasis on Pan-Slavism grew not only for the purpose of winning the war but more and more for that of establishing and maintaining a peace according to soviet Russia's plans and intentions through the close integration of all the Slav nations. The Moscow Pan-Slav committee began the publication of a monthly *Slavyane* (The Slavs) in Jan. 1943. Repeating the ideology of early Pan-Slav and Slavophile thinkers, the Slavs were proclaimed as by nature inclined to and predestined for leadership in an ideal peace and constructive internationalism. The Communist parties in the various Slav nations after the victorious conclusion of the war, in Yugoslavia, Poland, Czechoslovakia and Bulgaria, became the foremost supporters and propagandists of this new Pan-Slavism under the leadership of the U.S.S.R., the mother country of communism and the oldest and most powerful among the brotherly Slav nations.

For the first time, people of Slav race or descent living outside the Slav countries and being citizens of non-Slav nations—especially Slav immigrants into the U.S., Canada, Latin America and other centres of Slav immigration—were organized for support of, and loyalty to the Slav motherlands united in the Pan-Slav movement under communist inspiration. Such a Slav congress was created in the U.S., where there were many citizens of Slav, especially Yugoslav and Polish descent. An article in *Slavyane* (Aug.-Sept. 1946) put the number of Americans of Slav descent

at 15,000,000. The chairman of the U.S. Slav congress was Leo Krzycki, a labour leader of Polish descent. Similar committees were active in Latin American countries, especially in Argentina. A Pan-Slav regional congress for the middle east met on July 20 in Jerusalem, Palestine. Slav committees were created in Belgrade, Yugoslavia, Warsaw, Poland, Prague, Czechoslovakia, and Sofia, Bulgaria, in co-operation with the Pan-Slav committee in Moscow whose chairman was Lt. Gen. Alexander Gundorov.

The preparatory committee to call the first postwar Pan-Slav congress met in July 1946 in Belgrade and decided to convene the congress on Dec. 8, 1946, in Belgrade. In the centre of the congress agenda were placed lectures and discussions on "the Slav nations in the struggle for peace and democracy" and on "contributions of the Slav nations to world culture." Each of the five Slav states (the U.S.S.R., Poland, Czechoslovakia, Yugoslavia and Bulgaria) was represented by 20 delegates. It was interesting to note that the soviet union, which contained many non-Slav nationalities and had always refused to be regarded as a national or racial state, was represented as a unit, while two Slav nations within the soviet union, the Ukrainians and the Byelorussians, were not represented separately, though the soviet union claimed and received for them special representation in the United Nations, in addition to that of the U.S.S.R.

On Dec. 8, 1946, Marshal Tito opened the Pan-Slav congress in Belgrade. The Yugoslav capital was chosen as the permanent seat of the Pan-Slav committee, consisting of one delegate from each of the five countries. Lt. Gen. Gundorov stressed that "Slav organizations together with progressive international organizations should wage an untiring struggle against the remnants of Fascism and war mongers. They should fight against spreading lies against the soviet union and Slav countries, and they should spread true information concerning them." He appealed especially to the "Slav progressive immigrants" in the U.S. and other countries to fulfill these tasks.

Papandreou, George

Papandreou (1888–), Greek politician, was educated at the Universities of Berlin and Athens and was governor general of the Aegean Islands, 1916–20. He became leader of the Radical Socialist party in 1935, opposed the Metaxas dictatorship and fled Greece after the German invasion in 1941. He then went to Cairo, where he became premier, April 1944, of the Greek government-in-exile. His regime had full endorsement from Prime Minister Winston Churchill.

Papandreou's authority was strengthened by the presence of six representatives of the Ethnikon Apeletherotikon Metopon (or E.A.M.), the strong leftist resistance organization, in his cabinet. However, his order of Nov. 8, 1944, calling for dissolution and disarming of the leftist resistance groups, led to the resignation of the E.A.M. representatives from his government. As the armed rightist groups were far outnumbered by the E.A.M., Papandreou called on British armies in Greece for support. Angered, the Ellenikos Laïkos Apeletherotikos Stratos (or E.L.A.S.,

the military arm of the E.A.M.) resisted the efforts made to disarm them and civil war broke out in Athens, Dec. 5, 1944. Churchill charged the E.A.M. was attempting to impose a "communist dictatorship" in Greece. E.A.M. leaders retorted that Papandreou was striving to set up a "one-man dictatorship" on the Metaxas model. Unable to cope with the crisis, Papandreou resigned as premier, Dec. 31, 1944.

Papen, Franz von

Von Papen (1879–), German statesman and diplomat, was born Oct. 29, 1879, in Werl, Germany, the son of a wealthy Westphalian landowner. He attended military schools, entered the army at the age of 19 and was promoted to a captaincy in 1913. The following year (1914), he was appointed military attaché in the German embassy in Washington, where, with Capt. Carl von Boy-Ed, the German naval attaché, he directed espionage and sabotage activities. In 1915, the United States demanded their immediate recall. Von Papen rejoined the army, serving on the Somme and later in Palestine as chief of staff of the 4th Turkish army. He resigned from the army after the Armistice and entered politics, becoming a member of the Prussian diet.

After Heinrich Brüning became chancellor in March 1930, Von Papen plotted to unseat him. His intrigues bore fruit in 1932, when Paul von Hindenburg, with whom he enjoyed friendly relations, was "persuaded" to oust Brüning and name Von Papen chancellor. However, Von Papen could not secure adequate support in the reichstag, and on Dec. 2, 1932, Kurt von Schleicher became chancellor.

On Jan. 4, 1933, Von Papen arranged for Adolf Hitler to meet German industrialists, who contributed 4,000,000 marks to the Nazi treasury. Reinforced by Nazi support, Von Papen then persuaded Hindenburg to dismiss Von Schleicher. On Jan. 30, 1933, Hitler formed the first Nazi cabinet, and Von Papen was named vice-chancellor. Hitler, however, grew dissatisfied with Von Papen, who in turn resented Nazi failure to consult with the conservative element in the government. Von Papen's irritation over the situation was climaxed in his Marburg speech in June 1934 in which he denounced the Nazi attempts to suppress the free press and the church. Enraged, Hitler ordered the arrest of Von Papen and his office force; two of his associates were murdered.

Von Papen was released July 3, 1934, and notwithstanding the murder of his associates, accepted the position of "special envoy" to "restore friendly relations" with Austria. He aided and abetted Austrian Nazis, and arranged the Schuschnigg-Hitler conference, Feb. 12, 1938, in Berchtesgaden. On March 10, 1938, the day before Hitler ordered the occupation of Austria, he recalled Von Papen to Berlin.

Thereafter, Von Papen retired to private life until April 1939, when he accepted the ambassadorship to Turkey. He remained there until 1944 when Ankara broke off relations with the axis. Shortly afterward, Von Papen returned to Berlin.

Toward the close of the war, he was taken prisoner by U.S. 9th army troops in the Ruhr (April 10, 1945) and was indicted by the International Military Tribunal at Nuremberg as a war criminal. While the court deplored Von Papen's offenses against political morality, it stressed such actions were not covered by the charter and stated there was no evidence showing that Von Papen had been

a party to planning aggressive war. Consequently, he was acquitted, Oct. 1, 1946.

Paper and Pulp Industry

The paper industry is an ancient one, dating back to the year 100 when a Chinese craftsman demonstrated that paper could be made from fibres from the inner bark of the mulberry tree and from old fish nets. This art was passed down through the centuries until, about 1800, a machine was invented to make paper in a continuous web. Textile fibres were the principal raw material used until the 1880s, when the fibres from wood were found suitable and several chemical and mechanical processes were invented to separate the fibres from their binding encrustants. The invention of movable type printing in the early 1800s provided a great stimulus for the use of paper as a printing medium. With the establishment of the wood pulping processes and the paper machine the production of paper grew steadily with increases in population and expanded usages through the years.

United States.—The decade 1937–46 was abnormal in many respects. In the years just prior to World War II, the U.S. paper industry was emerging from a depression, and the war years presented an entirely different aspect, one of unprecedented general demand, and a new particular demand for new types of papers to act as substitutes for container materials such as metal foils, rubber, glass and sheet metals.

During this decade, improvements in the United States resulted in higher qualities of product and lower prices for the consumer to pay. At the same time employment increased, and although the industry produced more paper per employee by 1939 than it did in 1929, the increasing total production overcame the technological unemployment which usually follows such a development. By the end of the 1930s the industry employed 7% more wage earners than it did in 1929. Moreover, workers in the industry were able to buy with their wages 13% more goods and services than they could in 1929. These comparisons relating to the more normal years just before the war reflected the vitality of a growing and healthy industry even when faced with the expected handicap of a depressed economy.

The outbreak of World War II brought an unprecedented demand for newsprint, bookpaper, wrapping, special industrial papers, multiwall shipping sacks, paperboard shipping and inner containers and many other items. The rise was accelerated after the attack on Pearl Harbor, and paper, normally one of the cheapest and commonest of materials, eventually became one of the most scarce in relation to demand.

Although the war caused wood pulp imports from Scandinavia to drop sharply and finally to disappear, increased U.S. production and importation from Canada raised the total U.S. wood pulp supply from 9,000,000 tons in 1939 to 12,000,000 tons in 1942. At the same time, paper and paperboard production rose from 13,500,000 tons to more than 17,000,000 tons with the aid of wastepaper drives, which brought in 6,000,000 tons annually in 1941 and 1942. When Scandinavian imports were cut off it became necessary for the government to institute many controls such as allocating the existing supplies of wood pulp to all paper mills, whether manufacturers of wood pulp or not, and establishing a priority status for all grades of paper and

U.S. school children participated in the national wastepaper salvage campaigns which helped meet the wartime paper shortage

paperboard on the basis of their relative importance to the war effort. By use of such controls nearly all mills were able to participate in production.

Victory in Europe was opportune. It brought an immediate and sizable reduction in the use of wood pulp for nitration purposes and it promised some relief through importation of pulp from Sweden. Many control orders were revoked, and since the war did not require the physical conversion of the pulp and paper industry, reconversion did not pose any serious problems.

During the war, inventories of pulpwood, wood pulp, paper and paperboard were greatly depleted and needed to be built up. The widespread substitution of paper and paperboard products for steel, tin, lumber and other scarce materials in the early stage of the war opened new markets for these products, many of which were retained. Striking advances were made in paper use during the war, particularly in waterproof packaging materials. There was reason to anticipate postwar consumption of printing materials at record-breaking levels.

An over-all picture of the U.S. paper and paperboard industry during the decade is shown in Table I:

Table I.—U. S. Paper Industry, 1937–46
(Tons of 2,000 lbs.)

	Production	Imports	Exports	Consumption	
				Tons	Lb./capita
1937	12,837,003	3,435,222	232,361	16,039,864	248.2
1939	13,509,642	2,702,953	266,079	15,946,515	243.4
1941	17,762,365	3,120,213	494,911	20,387,667	308.9
1943	17,035,688	2,762,429	347,864	19,450,253	286.8
1944	17,182,804	2,616,000	344,000	19,454,804	286.1
1945	17,370,965	2,754,880	458,634	19,667,211	281.7
1946 (est.)	18,620,000	3,100,000	475,000	21,245,000	302.7

The capital investment in the United States industry in 1946 was \$2,900,000,000 in 926 units in 38 states. Fifty-eight per cent of the industry was in localities of under 10,000 population.

Canada.—The four great sources of Canadian wealth are forests, farms, minerals and water power. Of the peacetime manufacturing industries, pulp and paper had stood first in employment, first in total wages paid, first in export values, first in net value of production and first in capital invested. The capital invested in the pulp and paper industry in Canada at the outbreak of World War II was more than double that of the next largest manufacturing industry in the dominion.

In newsprint paper alone, Canada had a mill capacity of over 4,250,000 tons a year, 4 times greater than any other country. About 94% of the newsprint output was exported. In the production of wood pulp, Canada was second only to the United States.

Excluding the war years, fluctuations in national income closely paralleled pulp and paper production. The industry became the largest individual buyer of goods and services in Canada. In 1944 the industry's purchases exceeded \$174,000,000 and included \$70,500,000 for transportation, \$21,600,000 for fuel, \$15,700,000 for electricity, \$34,600,000 for chemicals and mill supplies, \$6,600,000 for fibres and fibre stocks, \$19,000,000 for pulpwood and \$8,000,000 for food and fodder connected with operations.

The sums paid to workers ran to an estimated \$180,000,000 annually. Mill workers received \$75,000,000 and workers in the woods an estimated \$75,000,000. In 1946 there were about 82 pulp and paper companies in Canada, operating 108 mills in six provinces. In addition to pulp and newsprint, the companies had a highly-developed production of fine papers, wrapping paper, tissues, paperboard and other cellulose products.

The effects of the depression of the 1930s on the

Canadian paper industry had been devastating. The newsprint manufacturers were particularly hard hit. At one time 60% or more of this part of the industry was in default of its bond interest. By 1935 the social consequences of the disruption in the industry had become so distressing that the governments of Quebec and Ontario, where 80% of the newsprint capacity was located, adopted a joint policy of prorating orders among the mills in order to spread employment and to avoid the closing of any mills. Whole towns and their surrounding regions depended for their livelihood on the operations of these mills.

Demand began to improve in 1935, and by 1939 the industry had an annual capacity of 4,003,000 tons of groundwood pulp, 2,101,000 tons of chemical pulp and 4,546,000 tons of paper. During the earlier years of World War II, the manufacture of wood pulp and paper increased substantially. In 1940 and again in 1941, production exceeded all previous levels in both volume and value. In 1942, 1943 and 1944 the gross value increased still more, but the volume of pulp and paper produced was somewhat lower than in 1941.

Two factors accounted for this decrease in production; first, the urgent need for more men for war industries and the armed services reduced the supply of manpower for cutting pulpwood; and second, the production of munitions and war material necessitated the diversion to war plants of part of the hydroelectric power used in pulp and paper manufacture.

The wartime record of the industry was outstanding. During the six war years the industry provided Canada with more than \$1,250,000,000 (U.S.) and helped to obviate the need for lend-lease arrangements between the dominion and the United States. Forty countries relied chiefly on Canada for their wartime newsprint supply. For the Latin-American countries as a whole Canada supplied about 80% of their imports.

Both at home and abroad, Canadian pulp went in vast quantities into the manufacture of nitrocellulose for explosives and to make rayon for parachutes, self-sealing gasoline tanks and other war products. In one year alone Canadian paperboard boxes carried some 4,500,000 tons of goods from farm to factory to battlefronts and to consumers at home. They saved weight and space aboard ship and 2,000,000,000 ft. of lumber for other urgent war needs. In addition to making paper, the industry put 83 machine shops on a full war service basis, turned hundreds of untrained men into skilled workers and made gun mounts, winches, steering devices and many other essential items for the building and repair of ships.

Total production of all kinds of paper in Canada was as follows: 1937, 4,345,361 tons (2,000 lb.); 1939, 3,600,502 tons; 1941, 4,524,776 tons; 1943, 3,966,344 tons; 1944, 4,044,376 tons.

With the change-over of many mills in the United States from newsprint to other grades, particularly machine-coated groundwood book papers, the Canadian industry seemed likely to enhance its position as world supplier of this commodity. In 1939 the Canadian newsprint industry was far ahead of all others, as shown in Table II.

Table II.—World Production of Newsprint
(1939, in short tons)

Canada	2,869,000	Sweden	305,000
United States	939,000	Norway	226,000
British Isles	848,000	U.S.S.R.	200,000
Germany	415,000	Holland	104,000
France	276,000	Other, Europe	256,000
Finland	519,000	All others	12,000
Japan	437,000		
Newfoundland	308,000	Total	7,714,000

Great Britain.—From the time Queen Anne granted a ten-year monopoly to the British Company of White Papermakers in 1690, Britain has had an active papermaking industry. Britain first developed the Fourdrinier and cylinder papermaking machines and made many other contributions to the art of papermaking. After the defeat of Napoleon, Britain became the world's greatest international trader and banker. Being the leading papermaking nation, it also became the world's greatest exporting nation with respect to paper.

British dominance of the export field was challenged by Sweden, Norway, Finland and Germany when wood became the primary raw material. But Britain answered the challenge by the use of northern European wood pulp and with wood purchased from these and other European sources. The result was that at the beginning of World War II Britain was still one of the most important paper exporting nations, exceeded only by Canada, Sweden, Finland, Germany, Norway and the United States. In 1938 the United States slightly exceeded Britain's prewar exports but in 1941 the United States shipments were more than double those of 1938, while exports of Great Britain, reflecting wartime shipping difficulties, were reduced to one-third those of the 1935-1938 average.

Table III.—British Paper Industry
(In thousands of short tons)

	Production	Imports	Exports	Consumption
Ave. 1935-38.	2,645	1,251	200	3,705
1939	n.a.	1,129	156	n.a.
1940	2,305	678	148	2,565
1941	1,557	194	72	1,679
1942	1,441	146	37	1,550
1943	1,299	143	28	1,414

War damage to the British paper industry apparently was not extensive, and with wood pulp supplies moving in from Sweden and North America during the postwar period, the situation was much improved.

Scandinavia.—The Scandinavian countries and Finland are essentially producers of wood pulp for export purposes. During World War II production was restricted largely to local needs for cattle fodder, paper and chemical products. Limited shipments were permitted to be made to neutral countries.

Table IV.—Swedish Production and Export of Wood Pulp
(1935-39, short tons)

	Production	Exports
1935	3,278,446	2,318,048
1936	3,505,870	2,512,758
1937	3,883,901	2,813,616
1938	3,373,693	2,183,114
1939	3,456,975	2,569,775

It will be seen that 1937 was the peak year in production and exports. These exports were shipped to 41 countries, but 83% went to six countries as follows: United States 1,084,634; Great Britain 650,242; France 271,057; Japan 123,068; Germany 107,188; Italy 106,785.

The Swedish pulp mills were believed to have ample supplies of pulpwood cut and in their stock piles at the end of the war. A definite shortage of coal was reported, however, and firewood was being used to a considerable extent in the boilers. It was likely that Sweden would exchange much of its wood pulp with Britain for much-needed coal.

Finland and Norway operated their mills during World War II, but no statistics were available covering this period. In 1945, 505,495 metric tons of wood pulp were produced for export. Of this, the United States had contracted for 126,180 metric tons. The soviet union, however, cancelled restitution payments so that no further shipments of pulp could be made under that category. In 1945 Finland produced 207,634 metric tons of sulphite

Wastepaper, mainly salvaged by U.S. householders, being churned into pulp in macerating vat during 1944. The pulp was later rolled into paperboard

pulp, 156,381 of sulphate pulp and 307,377 of groundwood. The groundwood industry was severely handicapped by lack of power caused mainly by the loss of two large power stations in the ceded territory.

In Norway the pulpwood supply problem was the greatest single difficulty facing the industry in the postwar period. Occupation by the German forces had nearly destroyed the pulpwood-gathering facilities of the industry.

The capacity, however, was about the same as before the war. Expressed in metric tons this was 1,524,000, including all kinds of pulp. The mills were expected to operate in 1946 at about 35% of capacity. (See also CHEMURGY.) (R. G. M.)

468 Paraguay

Paraguay, a landlocked republic in south-central South America, is bounded on the north and east by Brazil, on the south by Argentina and on the west by Bolivia. Its latitude centre is the 25th parallel, and its east-and-west extension from the 55th to the 60th meridians of longitude. Area 149,807 sq.mi., of which 61,004 lie east of the Paraguay river and are well-settled, while 88,803 lie west of the river and are sparsely inhabited. Access is mainly by the Paraguay-Paraná river system (966 mi. Buenos Aires to Asunción), although a railway also gives connection with eastern Argentina. Capital, Asunción, population (est. Dec. 1943) 126,280 (Greater Asunción 186,875). Other cities: Villarica 30,176, Concepción 16,007, Encarnación 15,610. Official language: Spanish. The Guaraní tongue has survived more than the blood, but is secondary and recessive. Official religion: Roman Catholicism; all religions are tolerated. Official estimates of population: 1938, 954,848; 1943, 1,108,040. The latter estimate showed 1,056,139 in eastern Paraguay, and 51,901 in western Paraguay—the Chaco. The Spanish strain predominates in the bulk of the population, with varying minor proportions of Guaraní; and the Italian strain is substantial. Many farm colonies were founded by groups from other nations, but most of them, except those of German-Brazilian and German-Mennonite stock, had been dissipated in 1946. The presidents of Paraguay during the decade 1937–46 were as follows: Col. Rafael Franco (Feb. 17, 1936–Aug. 15, 1937); Dr. Félix Paiva (Aug. 16, 1937–Aug. 14, 1939); Gen. José F. Estigarribia (Aug. 15, 1939–Sept. 7, 1940); Gen. Higinio Morínigo (after Sept. 8, 1940).

Aftereffects of the Chaco War.—When Paraguay was attacked by Bolivia in the Chaco War in 1932 the country's defense had been inadequately prepared. The entire manpower of the country was mobilized and found itself without proper equipment. During the three years of hardship and struggle there arose among the officers, both temporary and professional, a desire to modify the manner of government; but there was no unanimity as to a new pattern. After the armistice of June 1935 which ended hostilities the economic and financial condition of the nation had very badly deteriorated. An Association of Ex-Combatants was formed, numbering more than 100,000 members. Socialist and Communist organizers were active and effective and a quasi-fascist movement arose among the younger educated class.

The leading army officers had been particularly disturbed by the moderate policy pursued by the Ayala government at the Chaco peace conference at Buenos Aires—a policy which they regarded as showing the traditional Liberal amenability to Argentine influence and as conceding too many of the fruits of Paraguay's victory. In Jan. 1936 Eusebio Ayala had agreed to permit a neutral military commission to enforce an agreement against further military activities in the Chaco and further increases of troops or arms. General elections were to be held in March, and leaders of the Colorado party led certain army officers to believe that the Liberals would use their power to ensure their return to office. In Feb. 1936 the government had dismissed and exiled Col. Rafael Franco, who had zealously been preaching reforms in the military school which he commanded. The garrison regiments at Campo Grande, on the outskirts of Asunción, led by Cols. Federico Smith and Camilo Recalde, marched on the capital, seized the government and brought back Col. Franco

to be chief of state, on Feb. 17, 1936.

The Franco Dictatorship.—Franco accepted his mandate, in a public statement, as coming from the Paraguayan army, a new departure which was to be followed with variations several times in the decade 1937–1946. It is to be noted that the army and the male population were at that time imbued with a feeling of mutual fellowship—a situation which tended to disappear in the next few years.

It was at once apparent that Col. Franco, albeit a high-minded idealist, wished to institute a fascist state. He forbade all political activity, imprisoned or exiled the leaders of the former pseudo-democratic government and curbed the press. He brought back to Asunción and enshrined in the national pantheon the body of the dictator Francisco Solano López, whose disastrous war in the 1860s had been adversely regarded; and he gave notice of Paraguay's withdrawal from the League of Nations. He undertook to form a single National Revolutionary party, on the Italian and German style. In the direction of national socialism he established price and wage control boards favouring the workers, provided for collective bargaining and the eight-hour day, created a national bank, founded agricultural schools, a "people's university" and units for combating endemic diseases. He raised the taxes on wealth and industry, and threatened to socialize several of the large enterprises. Conspicuous were his measures toward breaking up the great *estancias* to create small farms.

The party-line Communist agitators and their Socialist fellow-travellers, who were infiltrating the common soldiers and were in control of the Workers' federation, wished these reforms to be carried out not by authoritarianism but by a workers' republic on the Russian order; they so greatly antagonized both Franco and the army officers that several of their leaders were forcibly exiled. Franco subsequently tried to regain leftist support by cabinet changes, with little success, and his National Revolutionary party fell apart. Meanwhile he was losing both army and Colorado support by failing continually, despite repeated promises, to call national elections.

In order to secure formal recognition for his government by other nations Col. Franco had been forced to recognize the Chaco agreements signed by his predecessor, and this was disliked by the army officers. While his delegates to the peace conference adopted an intransigent tone at Buenos Aires, they finally agreed with his approval of a plan for resuming diplomatic relations with Bolivia, based on the payment by the latter of a heavy indemnity to Paraguay for prisoner upkeep and on the withdrawal of Paraguayan troops from the Villa Montes road in the Bolivian oilfields. The army would have none of this plan and, after Bolivia had paid its indemnity, still refused to surrender the road. On this issue, and on its desire that elections be called, an officer group led by Col. Ramón Paredes forced Franco's resignation in mid-August 1937, permitting him and his aides to depart from the country.

Interim Government.—The army now installed Dr. Félix Paiva as president, despite his genuine unwillingness. Dean of the law faculty and a former Liberal vice-president, he had never descended to practical politics and was respected. On taking office he announced that elections would promptly be held, and that while the workers and small farmers would be safeguarded, he would also protect property and industrial interests and would permit the return to Paraguay of former President Ayala and other Liberals. Rendered hostile by these declarations, the leftists, who had failed to follow Franco when he was in power, decided to reinvest him with the presidency, and staged a strong revolt on Sept. 7, 1937, which was put down by the

army with considerable difficulty. Paiva was compelled to proclaim martial law, and appointed as minister of interior Col. Arturo Bray, an army strong man. He proceeded with his plans for elections by naming an electoral commission on Oct. 25; but the adherents of Franco claimed that they were not properly represented and resorted to another subversive attempt, again crushed. A few weeks later in December, when martial law was lifted, the Franquistas made their third abortive revolt.

Sustained by the army leaders and Col. Bray, Paiva moved steadily toward the renewal of democratic government. In Feb. 1938 he issued a call for congressional elections to be held in September. He also welcomed back to Paraguay Gen. José Félix Estigarribia, who had been the modest and brilliant commander-in-chief of the forces in the Chaco War. The people joined enthusiastically in the welcome, and Gen. Estigarribia was given the important post of minister to the United States. A few weeks later the political parties were permitted to reorganize and resume campaign activities. The Liberals chose as their leader and future presidential candidate Dr. Jeronimo Zubizarreta, who had been Paiva's representative at the Chaco peace conference and whose recalcitrant attitude in that capacity had been widely admired. When the Chaco peace treaty was signed in July 1938 (see below), Paiva submitted it to the people in a plebiscite, a democratic procedure; and in September the congressional elections were held as promised.

Unfortunately the Colorado party, which had boycotted all elections since 1931 on the ground that they were dominated by the Liberals, pursued this policy once again, and the Franquistas took no definite position; so that the new congress was almost wholly Liberal. It wisely decided to maintain Paiva as provisional president pending regular presidential elections in the spring of 1939 and the inauguration of the successful candidate at the regular time in the following midsummer. With martial law continuing to be intermittently necessary, the government lowered taxes on enterprise, resumed partial payments on the debt and appealed for Leftist approval by consolidating much of Franco's labour legislation. By Feb. 1939 it was able to dispense with Col. Bray and permit freedom of the press; and the Liberals, who had turned away from Zubizarreta on the peace treaty, nominated Gen. Estigarribia for the presidency. The other parties did not wholly abstain from voting when the elections were held on April 30, 1939, but Estigarribia was chosen by a two-thirds' majority.

Chaco Peace Treaty.—Early in 1938 the neutral mediators at Buenos Aires had made a special attempt under the auspices of the retiring President of Argentina, Gen. Agustín Justo, to bring about an agreement on peace by sending missions to Asunción and La Paz. The two belligerents had remained refractory to the proposals, but views were secured which permitted the drafting of another formula in May. The adherence of Bolivia's representative was given to this compromise; but Paraguay's Zubizarreta was still obdurate, and his counter-proposal was found inequitable by the mediators and Bolivia. By late June it appeared that an impasse had been reached after three years of negotiations. Both contestants began rearming, frontier clashes occurred and the resumption of war seemed not improbable.

At this juncture came the spectacular and unexpectedly efficacious personal intervention of Gen. Estigarribia, who flew from Washington to Buenos Aires and was quickly able by his tact and persuasiveness to change the attitude of the Paraguayan delegation, notwithstanding Zubizarreta's resistance. Whatever his instigation may have been,

he secured the drafting of a new treaty which was initialed by both delegations on July 9, 1938. It was accepted by their respective home governments on July 17, and was at last signed formally on July 21, 1938. The boundary was to be fixed by a commission of neutral arbitrators on a line somewhere within the zone to which the dispute had narrowed down. The mediators at Buenos Aires were asked to arbitrate, and on Oct. 10 issued an award which fixed the frontiers permanently. It gave Paraguay most of the territory she had occupied, including four-fifths of the Chaco; but left to Bolivia her oilfields under exploitation and gave her a port on the upper Paraguay river together with transit rights at the Paraguayan Puerto Casado.

The relations between Paraguay and Bolivia were renewed by an exchange of ministers in November. Little use was made by Bolivia of the access to the river which had been so greatly desired, the distances being great both from the river to eastern Bolivia and from the ocean to the fluvial ports. Rail construction into Bolivia to the north of Paraguay was undertaken by Brazil and to the west of Paraguay by Argentina, so that the likelihood of friction between the two countries was greatly lessened. The Bolivian oil deposits did not as yet show great promise. There was some possibility, however, that oil might be found in the Paraguayan Chaco, where the Union Oil Company of California conducted active explorations under a contract signed with Paraguay late in 1944.

Estigarribia's Presidency.—The president-elect, chosen not only as the hero of the war but the negotiator of the peace, was able to procure economic aid at Washington from the Export-Import bank before returning. A German agent had come to Paraguay in April 1939 and offered loans for an economic program embracing the long-sought highway to Brazil and a chain of tobacco factories, guaranteed by a state monopoly on petroleum products. In June the need for acceptance was obviated by credits arranged by Estigarribia with the United States, with \$3,000,000 for the road and a water system at Asunción, and \$500,000 for stabilizing the currency. On his homeward journey the general also secured Brazilian pledges for a branch bank and a railway into northern Paraguay, together with Argentine pledges for river dredging, boundary adjustments and an Argentine branch bank at Asunción.

After Estigarribia's inauguration on Aug. 15, 1939, it soon became clear that army support would be no less indispensable for the new president than for his predecessors. He left aside the elder Liberals, who would have preferred Zubizarreta and who were disliked by both the Colorados and the Franquistas. As the two latter groups were non-co-operative, he sought out new talent, mainly rather youthful, for his cabinet; and he chose a new army leader, Gen. Nicolas Delgado. With a program of moderate reforms he coupled efforts to induce the Colorados to take part in choosing a new Congress which should be less one-sidedly Liberal. By autumn, however, he was under fire from a new direction, as there had arisen a group of intellectuals who were disciples of the philosophy of Premier Antonio de Oliveira Salazar of Portugal. Headed by Dr. Luís A. Argaña, they founded the newspaper *El Tiempo*, and early in 1940 staged a prolonged students' strike. Just when the Colorados were on the verge of pledging participation in elections, a law passed by the government to cope with the Tiempistas restricted the freedom of the press and of assembly and caused the Colorados to break with Estigarribia. Factional chaos was again rampant, and on Feb. 18, 1940, the cabinet resigned and was reorganized, while

Pres. Higinio Morínigo of Paraguay addressing the U.S. house of representatives in 1943, at which time he reaffirmed his country's pledge to keep her international commitments. Morínigo was re-elected for a six-year term in Feb. of that year. Speaker Sam Rayburn is seated at the rostrum

the congress voted to dissolve itself and leave the president free to prepare a new constitution on democratic lines.

Assuming dictatorial powers with army backing, Estigarribia pledged a new form of government based on, corporative and economic collaboration by all classes. He named a commission of jurists, headed by former President Cecilio Baez, to draft a substitute for the constitution of 1870, and assisted in its labours for four months. By early July the new charter was completed and submitted to a plebiscitary vote, and on Aug. 15, 1940, it was formally proclaimed. It provided secret and compulsory voting, and guaranteed not only the civic freedoms and the rights of labour but also land ownership by every citizen. At the same time it conferred upon the president sweeping emergency powers to be used at his discretion, and in lieu of a senate it established a corporative council representing various economic, professional and religious elements along the lines of fascist models. In view of Estigarribia's undoubted devotion to the cause of the democracies this instrument did not occasion criticism abroad, and it seemed calculated to preserve order in faction-ridden Paraguay. The hopes for the future of the nation were abruptly dashed, however, by the tragic accidental death of the president on Sept. 7, 1940, in a plane crash.

Morínigo in Power.—The persistent determination of the army to ensure stability was brought into play by the prompt resurgence of ambitious manoeuvres on the part of the political chieftains of both parties, as well as of the Communists and Franquistas. In the belief that none of the groups would co-operate with any other, or could give good government if in power alone, the officers imposed upon the cabinet, with the approval of the supreme court, the designation of Higinio Morínigo as chief of state.

During the Chaco War and subsequently as Estigarribia's minister of defense, he had shown a talent for keeping the armed forces fairly well united; and he shared

their feeling that an enforced political truce was needed for economic and social tranquility.

He announced the continuation of Estigarribia's program, but within a month was forced to dispense with the former inexperienced brain-trust cabinet; and Col. Paredes issued a statement that the army was guaranteeing Paraguay's government.

Just before his death, Estigarribia had asked the United States for extensive additional economic aid, and the country was convinced that this was forthcoming and was highly important. Morínigo was thus faced with the problem of persuading Washington that he would follow his predecessor's policies while at the same time using non-democratic means to stay in power (as Estigarribia would probably have been forced to do). He chose as his first minister of foreign affairs Dr. Tomas Salamoni, known as a collaborator with the democracies; and he sent to President Franklin Delano Roosevelt, in the hands of a pro-U.S. minister, Dr. Juan José Soler, a holographic letter pledging support in hemispheric defense. Late in November, to show that his government was not that of any special officer-group, he replaced Col. Paredes by Col. Sosa Valdes. At the same time, to assure a modicum of civilian support, he brought the Tiempo Catholic Action group into his cabinet, and to do so he gave the foreign ministership to its leader, Dr. Luís A. Argaña. The U.S. government, while willing to believe provisionally in the pro-Ally intentions of Morínigo and Argaña, limited its assistance for the time being to continuing the instalments on the credits already granted, and offering a further \$900,000 for a mandioca-starch industry and river port works. This relative success by the new regime somewhat encouraged the numer-

ous revolts engineered by the politicians and Communists during the early months of 1941; but Morinigo was able always to rally sufficient strength among the officers so that his domination of the situation was gradually confirmed.

The impression that the Paraguayan government, because of its military and non-democratic character, was disposed to favour the axis cause was fostered by its Paraguayan opponents, mostly voluntary exiles, in other capitals; and the Argentine government sought to influence Paraguay against adhesion to the United Nations. The French military mission at Asunción, under Vichy impulsion, propagated defeatist sentiment among the army officers; and the large German and Italian elements in the population, as well as the German and Italian legations, lent their support to Morinigo in the expectation that his policy would be pro-totalitarian.

On the other hand, the president himself took pains to point out that the powers he had assumed were merely those contemplated by the Estigarribia constitution; and he resorted to no executions and few imprisonments. He became diplomatically convinced of the danger which an axis victory would bring to the independence of small nations such as Paraguay, and also of the probability that in a war of matériel the western powers would eventually win. The earnestly religious Tiempistas found Adolf Hitler's paganism and barbarous methods repugnant. Thus it came about that at the end of 1941 the Pearl Harbor attack revealed the Morinigo regime to be staunchly pro-Ally. When the Rio de Janeiro conference was convoked, the Argentine government invited Foreign Minister Argaña to Buenos Aires and made remarkable efforts to secure his attachment; but at the conference he was foremost in announcing the rupture of relations by his government with the axis.

The implementation of the Rio de Janeiro policies was extremely difficult in Paraguay, where the German and Italian residents were numerous, useful and orderly. The economic and political pressure of Argentina was potent and unrelenting, while the army was disposed to authoritarianism and impregnated with Vichy propaganda. Nevertheless, Morinigo and Argaña, moving cautiously and adroitly, were able by June 1942 to arrange the expulsion of the axis diplomats, and sent into diplomatic exile the pro-

Vichy minister of the interior. They also permitted, and insofar as practicable abetted, the functioning of the U.S. and British black-listing operations, although this dislocated the predominantly Argentine and German commerce and industry of the country. The recommendations of the hemispheric Political Defense committee were accepted in principle, and Paraguay never became a centre for transmitting axis information. In 1944, some of the leading German-Paraguayan organizers were interned. The construction of a U.S.-financed airfield was sanctioned in 1942, and although interrupted by an unruly army unit was duly completed by the end of 1943. In the series of hemispheric conferences throughout the war, Paraguay unwaveringly sustained the Brazilian and U.S. points of view. This had its significance not only because of her strategic geographic location on the frontiers between pro-Ally Brazil and pro-axis Argentina but also because of her traditional military prowess and the notable reputation of her fighting forces in combat. Paraguay received very substan-

Later Governmental Adjustments.—The participation of the Tiempistas in the Morínigo government weakened the Franquista opposition, as many Franquistas had views parallel to those of the Argaña group. Morínigo was willing to give the Colorados a share in the cabinet, but they would accept nothing less than complete control, and when this was refused they had insufficient strength in the army to upset the regime. The younger Liberals were pro-Ally, like Morínigo; and the elder Liberals, mildly pro-Argentine, showed no large popular support. Therefore the numerous conspiracies and attempts against the government during 1942 were never effective. The left wing of the Franquistas, under Communist leadership, did succeed in converting the volatile student sentiment, formerly pro-Argaña, to an alliance with the workers; and the strikes of the students and labourers constituted Morínigo's greatest problem. The army backed him in a policy of firmness, and after the U.S.S.R. became a co-belligerent with the Allies the Communists made somewhat less trouble.

In Feb. 1943 the presidential elections which Morínigo had promised were duly held, and since no political activity was permitted and no candidate named except the general himself, he emerged with a well-nigh unanimous and apparently fairly heavy popular vote. Prior to his inauguration he made a series of state visits to other American countries in May and June. He was received with great cordiality in Brazil; and at Washington he addressed the U.S. congress and laid the basis for a trade agreement. Other countries which welcomed him were Mexico, Panama, Venezuela, Colombia, Ecuador, Peru, Chile and Bolivia. When he was inaugurated on Aug. 15, 1943 for a five-year term, some 24 nations sent delegations in recognition of his continuance as a chief of state; and these delegations were able to note the quality of his armed forces.

After the success of the reputedly Argentine-instigated Villarroel revolution in Bolivia late in 1943, the Paraguayan Liberals in turn made a resolute revolt in Feb. 1944, but a sufficient proportion of the army officers remained loyal to Morínigo so that it was put down. The recognition of the Villarroel government in April by the Allied governments, however, was taken by Dr. Argaña as indicating that a strong policy toward Argentina would not be followed by the democracies; and as he had incurred the hostility of Argentina he felt it best to resign from the cabinet, taking his Tiempo colleagues with him, to leave Morínigo less subject to antagonism from President Edelmiro Farrell at Buenos Aires. Two or three non-political civilians were brought into the cabinet, but they were uncomfortable under army repression and in June 1945 their leader resigned because the army was monopolizing the national revenues.

When Juan D. Perón's election in Argentina in the spring of 1946 was followed by *rapprochement* with Brazil and the United States, Morínigo renewed negotiations toward a customs union with his southern neighbour. Desirous of evolving away from military government, he at length took the bold step of dismissing the strong anti-democratic officer clique led by Col. Benítez Vera, and was able to quell the ensuing rebellion by the latter in June 1946. After the Bolivian revolution which deposed Gualberto Villarroel in July, Morínigo announced that, in conformity with the hemispheric trend away from absolutism, his government was again permitting political activity in Paraguay. As the return of ex-President José Patricio Gug-

giari to Asunción brought unexpectedly vigorous Liberal manifestations, however, the political freedoms were once more curtailed, and Guggiari departed. Col. Franco, who had likewise returned, remained in Paraguay. President Morínigo's military and cabinet appointments were of a nature to confirm his intention to reinstitute popular government and to co-operate with the great democratic nations.

Paris

Capital and largest city of France, Paris had a population, according to the census of 1936, of 2,829,746 (2,891,020 in 1931). Many of the people of Paris continued to live, however, in the industrial and residential suburbs of Greater Paris, which formed the department of the Seine with an area of 185 sq.mi. and a pop. of 4,962,967 in 1936. The Parisian population overflowed also into the departments of Seine-et-Marne and Seine-et-Oise. Paris itself was divided into 20 arrondissements, each one with a mayor at its head. The municipal council of Paris, composed of 90 members, has no elected mayor, his place being taken by the prefect of the Seine and partly by the prefect of police.

Paris had been for many centuries not only the administrative and cultural centre of France but one of the great capitals of the world, equally renowned for the beauty of its monuments, the wealth of its literary life, and its pre-eminent position in the fields of painting and sculpture. The 19th century also saw the rapid growth of an important industrial region in a belt of factory towns surround-

German cavalry riding past the Arc de Triomphe, under which the tomb of the unknown French soldier of 1914-18 lies, as they entered Paris on June 14, 1940

ing the ancient city. The ten eventful years 1937-46 did not pass Paris by. Though only negligible war damage was done to the city and to its artistic treasures and historical monuments, the great upheaval in the world left deep scars in the moral and economic texture of the French capital. The fall of Paris in 1940 was due as much to the internal dissensions in France as to the strength of the Germans. In the postwar period, it was a painful effort for Parisians to regain their former position.

The decade 1937-46 found Paris in the near stage of a latent civil war between "left" and "right." The political and intellectual concentration of French life in the capital made Paris the foremost battleground of the conflicting national and international trends and ideologies of the fateful decade. In Feb. 1934, fascist sympathizers had arranged great demonstrations on the Place de la Concorde opposite the Palais Bourbon, seat of the chamber of deputies, the symbol of the democratic parliamentary institutions of the Third Republic. The disorders led to a reassertion of the democratic elements which formed a common front with the Communists, called Front Populaire, and assumed the government of France as a result of the parliamentary elections in 1936. The new government under the leadership of the veteran Socialist M. Léon Blum, carried through some of the much delayed social reforms in the interest of the French working class. The workers' unrest expressed itself in a wave of strikes which hampered French production at a time when the critical international situation demanded a thorough modernization of French military and economic forces. Nor was the French general staff in any way up to the requirements of the time.

City of Light.—In spite of all the difficulties, the efforts to improve and beautify Paris continued up to the beginning of World War II. Some congested, badly built and unhealthy districts were torn down and replaced by new buildings surrounded by parks and squares. At the various gates of Paris, in particular, where the old fortifications were destroyed, new cities grew up, and light and air became available to those Parisians who had hitherto been congested in the narrow streets of the centre of the city. Organizations such as the Office Publique d'Habitation à Bon Marché de la Ville de Paris undertook the construction and development there of blocks of flats, and their social service system installed baths, dispensaries, sanatoria and children's clinics, with a medical service in regular attendance to examine, care for, and generally look after the children. To meet the need for new churches in these new centres of population, the "Chantiers du Cardinal," founded by the archbishop of Paris, opened 106 places of worship. All around the city the outer boulevards, which had become indispensable in order to draw off congestion from the very heavy traffic in the centre, were considerably widened and improved. New tunnels were made. The main arteries out of Paris, much too narrow, were also widened. Considerable works were undertaken, especially toward the west, in the direction of La Défense, Courbevoie and Saint-Cloud, where the first French autostrade was planned. The bridges were also widened.

The International exhibition of 1937, though retarded in its opening by strikes, bequeathed to Paris some permanent architectural improvements. The exhibition pavilions lined the two banks of the Seine below the Pont Alexandre III. The Pont d'Iéna was widened, and the old national warehouses on the Quay d'Orsay were demolished. The old Trocadéro palace opposite the Eiffel tower was replaced by a new modern building, the Palais de Chaillot. Nearby, two new magnificent palaces, one national and the other municipal, were kept as places of exhibition of

contemporary art. Under the terrace on the site of the old Trocadéro building on the right bank of the Seine, a new theatre was opened with seating capacity for 2,800. It was completed in 1939, in the same year as the vast new ministry of communications in the Avenue de Saxe et de Ségur, and the museum of the ministry of public works. The interior of the Opéra was renovated, and a new lighting system was installed.

Shadows and Blackout.—The international situation threw its shadows over the capital and increased the gloom which social and economic unrest produced. The days of Sept. 1938 brought the expectation of war home to the Parisian population, who only two months before had greeted King George VI and Queen Elizabeth with great celebrations. The Munich agreement, which seemed to promise a peaceful settlement of the international crisis, was almost unanimously hailed by the people of Paris, who felt a great relief at the thought of their city and land being spared the horrors of war. But by the beginning of 1939 the situation worsened again. Preparations for protection against air raids and for the evacuation of the city in case of war proceeded slowly. Steps were taken to safeguard the art treasures of Paris. When war broke out in Sept. 1939, nearly 2,000,000 people, including most of the school children, were evacuated from Paris and its suburbs. When, however, weeks passed without serious warfare on the western front and when Paris was not subjected to the dreaded air raids, people returned to Paris and looked with great confidence and assurance upon the "phony" war. The blackout was never as complete as in London, and was soon relieved by increased street and shop-window lighting. The spring of 1940 presented, under a mild and friendly sky, a Paris lovelier than ever, with most people hardly aware of the threatening catastrophe for which city and country were morally and materially little prepared.

When on May 10 the German armies struck in the west, the French rear rose as little to the needs of the hour as the French army. The latter's efforts to hold the line of the Somme and the Marne rivers collapsed and the German armies approached Paris; whereupon the capital was declared an open city and was surrendered without fighting. Under similar circumstances, in 1870, the city had been heroically defended for four long months against the overwhelming power of the besieging German armies, and it was only extreme starvation which finally forced surrender. This time, the city of light and the capital of liberal influences on the continent of Europe gave itself up without the slightest try at resistance to the invading enemy of liberal thought, who proclaimed his easy triumph as a symbol of the decadence and collapse of democracy before the onslaught of totalitarianism. Early on the morning of June 14 the German forces entered the city.

When a census of the population of Paris was taken on July 7, 1940, it amounted to only 1,051,046. When the German armies approached, the people of Paris, like those of other communities of France, started an unprecedented, unorganized, panicky flight in all kinds of vehicles and on foot which increased the demoralization of France and impeded whatever military plans could be made. The armistice which France signed on June 22, 1940, divided the nation into an occupied and an unoccupied territory. Paris formed one of the six zones of the occupied territory and ceased to be the capital of France. The new government was established at Vichy.

By the end of the year, many people had returned to

U.S. troops marching down the Champs Élysées after the liberation of Paris in 1944

Paris. The German occupation forces on the whole behaved with very good discipline, but Paris now began to suffer from considerable physical privations, shortages of food, fuel and transportation making themselves felt almost immediately. The Parisian subway or "metro" became the chief means of transportation in the city. The bicycle began to replace motor cars and buses. The theatres resumed their functions, and newspapers and books were widely published, but the whole cultural life was strictly co-ordinated with the totalitarian principles of the German government and ideology and was closely supervised. The Germans encouraged the French factories to continue production. They also supplied raw materials which were needed for industry, but requisitioned a very large part of the manufactured goods for themselves. In 1941, clothes, thread and shoes became extremely scarce. While many necessities were lacking, some luxuries abounded, and there were many instances of feverish speculation both in luxuries and in works of art. According to statistics, 60 theatres, 66 dance halls and night clubs and 175 motion picture houses were functioning in the summer of 1941.

The threat of unemployment was partly averted by French industry working for the Germans. The latter used the considerable surplus of the costs of the occupation imposed upon France to buy control of many leading French industrial and commercial establishments. The fact that much of French industry worked for German war needs caused the American and British air forces later on to stage some mass raids over Paris, concentrating how-

ever on the industrial suburbs and sparing the city itself.

The growing resistance movement which was inspired by the example and the appeals of General de Gaulle provoked severe reprisals on the part of the Germans. The German administrator of Paris, General Otto von Stuelpnagel, resorted to the shooting of French hostages for real or alleged attacks on German officers and soldiers. After Germany had attacked the soviet union in June 1941, the French Communist party and the workers under its influence had taken an active and often a leading part in the resistance movement. As the tide of war turned against Germany in 1943 with the Allied victories at El Alamein and Tunis and with the Russian victory at Stalingrad, the underground movement gained in strength.

With the beginning of 1944 Paris assumed more and more the aspect of a stricken city: extreme starvation was to be found side by side with the thriving black market; the unusual quiet of the streets, only rarely broken by the noise of German motor cars, added to the strange impression; under the surface patriotic heroism and extreme demoralization contrasted and sometimes even intermingled.

But the liberation of the city came faster than many had expected. When the invasion army of U.S. and British troops defeated the Germans in Normandy and Brittany and approached the French capital, the resistance forces with the help of the local police rose on Aug. 19, 1944. Negotiations with the German occupation authorities es-

established a truce which averted the possible destruction of parts of the city by German bombardment. Sporadic fighting lasted until Aug. 25, when the arrival of tanks from a division of General de Gaulle's Free French under the command of Brig. Gen. Jacques Philippe Leclerc turned the tide definitely in favour of the resistance forces. Paris had been under German occupation for more than four years. When it became again the capital of France and the citadel of the liberal tradition on the European continent, the moral wounds and the economic enfeeblement produced by the eventful years of the immediate past continued to stay with Paris. Only the outside beauty and serene loveliness of this unique city emerged unchanged.

Scars.—Paris became the seat of the provisional French government headed by General Charles de Gaulle, who for more than four years had represented the moral forces of France and had become the symbol of her true liberty. But the war was still going on; the liberation from German control did not provide any immediate relief from the cold and hunger from which so many people in Paris had suffered so long. The Germans continued to occupy the most important Atlantic ports. Other ports being destroyed, supplies from abroad could therefore come in only very slowly, and the destruction of bridges and the depletion of rolling stock made communication between Paris and the provinces very uncertain. New problems were created by the large U.S. and British forces stationed in Paris or spending part of their furloughs there. The official rate of exchange was fixed at 50 francs to the dollar but was lowered in Dec. 1945 to approximately 120 francs to the dollar. But even this rate did not represent the true buying power of the franc. A very lively black market in dollars and other foreign exchange developed. On this black market the franc was quoted in the second half of 1946 at 280–330 for the dollar.

Parisians cowering on the sidewalk in panic when collaborationist snipers, barricaded in buildings on the Place de l'Hôtel de Ville, opened fire on them during festivities marking the arrival of General de Gaulle after the city's liberation in Aug. 1944

Life in Paris contrasted sharply with that in London. While in the latter city living was uniformly austere and sufficient supplies were provided for everyone, Paris offered the picture of bleak starvation side by side with black market opulence and wartime profiteering. A severe shortage of coal continued to make the winter uncomfortable and hindered the resumption of full industrial production. By the middle of 1946 the food situation had improved considerably. Taxicabs reappeared on the streets in greater numbers; many hotels which had been taken over for French or Allied governmental military purposes were returned to their original purpose, and the strain on the transportation system was eased by the growing number of buses. Many restaurants were well provided with meat, though the prices remained exorbitant. Goods began to reappear in the shop windows, but by the end of 1946 life was still very far from normal.

With the liberation of France Paris became again the seat of the French parliamentary bodies. The several elections held in 1945 and 1946 did not succeed in endowing France with a stable government. The Communists and the (Catholic) Popular Republican movement emerged as the two strongest parties, followed by the Socialists and by the various groups of liberal republicans of whom the Radical Socialist party was the strongest. By the end of 1946 the veteran Socialist leader Léon Blum had formed a cabinet to guide the nation over its parliamentary crisis until an agreement among the various parties about the formation of a stable French administration could be achieved.

The leading figures of the Vichy regime were tried in Paris after Germany's defeat. During 1945 the former chief of state, Marshal Henri Philippe Pétain, the former prime minister, Pierre Laval, and the intellectual leader of the anti-democratic and anti-British intellectuals, Charles Maurras, were among the prominent Frenchmen who had to face the court. Pétain and Maurras, both very old men,

were to expiate their attitudes in prison for the rest of their lives; Laval was executed. Other trials followed, but by the end of 1946 this chapter of French internal strife was practically closed. Journalism, the theatres, literature and arts were cleansed of the collaborators with the Germans in their ranks.

In 1945 a woman member of the municipal council launched an anti-vice crusade and demanded the closing of the city's 178 legalized houses of prostitution, some of them large and important establishments of world-wide fame. Legislation was passed and by Oct. 1946 all the houses were closed, a step which provided a minor alleviation to the housing crisis which was as severe in Paris as it was in all large cities.

In 1946 Paris again resumed her rank as an international capital. The Council of Foreign Ministers and the delegates of 21 states met in Paris, in the Palais de Luxembourg, to draw up the peace treaties with Italy, Hungary, Bulgaria, Rumania and Finland. The representatives of these former axis nations were invited to meet with the representatives of the victors in Paris in the spring of 1947 to sign the peace treaties. But any comparison with Paris as the centre of the peace negotiations after World War I made it painfully clear how much Paris and France had suffered in loss of strength.

Parliament, Houses of

History could not record more exacting years for parliament than the years 1937-46. Contemporary observers in the main agreed that parliamentary government had emerged strengthened from a period of extreme testing. Outstanding events were the abdication of King Edward VIII, the formation of the coalition government signifying unity of all parties for prosecution of World War II, and the advent, with an overwhelming majority, of a Socialist government. Perhaps the most significant feature dominating the whole political scene was that parliament remained omnipotent during the years of crisis and during the war met without interruption.

Before World War II.—On Nov. 3, 1936, King Edward VIII opened the second session of the 37th parliament. On Dec. 11 his majesty's Declaration of Abdication bill was passed through all its stages, and George VI was proclaimed king. A national government, predominantly Conservative with Stanley Baldwin as prime minister, was in power. The state of the parties in Jan. 1937 was 387 Conservatives, 33 Liberal Nationals, eight National Labour, two Nationals and one Independent (supporting the

government); 154 Labour party, 17 Liberals, four Independent Liberals, four Independent Labour party, four Independents and one Communist (in opposition).

The coronation of King George VI and Queen Elizabeth took place on May 12, 1937, in Westminster abbey with members of both houses present. The coronation was followed by the resignation of Baldwin, who was succeeded as prime minister by Neville Chamberlain. Legislation during the year included a Coal bill transferring coal royalties in private hands to the state and a Factories bill. A bill revising the scales of salaries for ministers acknowledged for the first time by legislation the office of leader of the opposition with a salary of £2,000 per annum attached thereto. The first indication of international upheaval came with the passing of an Air Raid Precautions bill.

The third session was opened by the king on Oct. 26, 1937. Parliamentary interest was focused on foreign affairs. In Feb. 1938 Anthony Eden, the foreign secretary, and Viscount Cranborne, under secretary, resigned after differences with Prime Minister Chamberlain over the procedure to be followed in Italian affairs. Eden was replaced by Viscount Halifax. The Eire Confirmation of Agreements bill which, among other matters, abrogated England's right to the occupation of the treaty ports, was passed without a division. As a result of pressure by back bench members a Holidays with Pay bill also became law. The house of commons was in recess when Chamberlain visited Adolf Hitler, first at Berchtesgaden and then at Godesberg. Parliament was recalled on Sept. 28, 1938, when war seemed imminent. The dramatic incident of a message inviting Chamberlain to Munich, which arrived during the course of a speech outlining events, produced an unprecedented scene of wild enthusiasm and emotion in which members of all parties joined. Sir John Anderson (Ind.) was appointed lord privy seal.

The king opened the fourth session of the 37th parliament on Nov. 8, 1938. The speech from the throne stated that the lord privy seal was charged with the organization of civil defense and the utilization of the resources of the nation for national voluntary service. The National Service act and Civil Defense bill were passed without opposition. On March 31, 1939, the prime minister announced a British guarantee to Poland in the event of aggression. This was followed by the Military Training bill, which for the first time in British history made provision for conscription in time of peace. Two new ministries were set up—the ministry of supply and the ministry of information—presided over by Leslie Burgin and Lord MacMillan respectively. In May the secretary of state for the colonies, Malcolm MacDonald, outlined the government's new proposals for Palestine which aimed at creating an independent Arab Jewish state in ten years. In Westminster hall, the French president, Albert Lebrun, and his wife were officially received by parliament. On Aug. 24 parliament passed in all its stages between 6:45 P.M. and 10:29 P.M. the Emergency Powers Defense bill. This bill, which gave the executive unlimited power to govern if need be by order in council, passed without a division. The safeguard for the people was its limited life and the need for fresh parliamentary sanction for its continuance. Prime Minister Chamberlain formed a war cabinet of nine persons which included Winston Churchill as first lord of the admiralty, and Lord Hankey.

Parliament in Wartime.—On Sept. 3, 1939, at noon, in the house of commons, Prime Minister Chamberlain announced that Great Britain was at war with Germany. On the same day four bills, including the National Services

(Armed Forces) bill, became law. On Sept. 5 the first bill relating to the organization of civilians was introduced. Three new ministries were established—economic warfare, food and shipping. Parliamentary business was solely concerned with matters affecting the prosecution of the war. Members of parliament were issued travel tickets for withdrawal to Stratford-on-Avon in the event that parliament could not continue to meet at Westminster.

The fifth session was opened by the king without the customary state ceremony on Nov. 28, 1939. In December the national expenditure committee consisting of 28 (subsequently 32) back bench members of all parties was set up. Its establishment was necessary, as for security reasons only token estimates were presented to parliament. The house of commons' jealously-guarded control of expenditure was adequately protected in the wide powers conferred on the expenditure committee. In April 1940 Chamberlain reconstructed his government. Leslie Hore Belisha, secretary of state for war, was replaced by Oliver Stanley. The ministry for co-ordination of defense was abolished. Lord Woolton became minister of food, Sir Andrew Duncan, president of the board of trade and Sir John Reith, minister of information. The war was going badly, and a vote of censure on the government was moved on May 8; 200 members, including many normal supporters of the government, voted for the vote of censure with 281 against. Chamberlain interpreted the vote as one of lack of confidence and in accordance with constitutional practice tendered his resignation to the king and advised him to send for Winston Churchill. The house met on May 13 with Churchill as prime minister; he had formed a coalition government.

The new war cabinet consisted of Winston Churchill as prime minister and minister of defense; Neville Chamberlain, lord president of the council; Clement R. Attlee, lord privy seal; Viscount Halifax, secretary of state for foreign affairs; Arthur Greenwood, minister without portfolio. Ernest Bevin, Herbert Morrison and Sir Archibald Sinclair were included in the government. The ministry of war transport was established and a petroleum department. By the end of the session Lord Beaverbrook as minister of aircraft production, Ernest Bevin as minister of labour and Sir Kingsley Wood as chancellor of the exchequer had joined the war cabinet. On the death of Chamberlain, Sir John Anderson became lord president of the council. Owing to damage to the house of commons, parliament for the first time was meeting at Church house, Westminster. Legislation passed by the coalition government included an extension of the original Emergency Powers Defense bill. It was passed in three hours and contained the most sweeping proposals ever placed before parliament in that it gave the government power to control persons and property in every way.

For the first time, parliament was opened by the king outside the precincts of the house of lords, at Church house on Nov. 21, 1940. The king's speech dealt only with the prosecution of the war. Viscount Halifax was appointed ambassador to Washington, and Anthony Eden became foreign secretary and a member of the war cabinet. By common agreement, election contests in constituencies ceased. The years 1940-41 brought the beginning of the manpower problem in an acute form. On March 20, 1941, the Registration of Employment order for women, with power of direction, was announced. The minister of labour appointed a women's advisory committee consisting of eight influential women to advise him regarding the registration and call-up of women. The house of commons chamber was destroyed in an air raid on May 10, but parliament continued to meet at Church house until later in the year,

when the house of commons resumed its sittings in the house of lords, and the lords met in the king's robing room, which had been converted for their use. Oliver Lyttelton was appointed minister of state in the middle east with a seat in the war cabinet. This session saw the first sign of an interest in the postwar years. In June it was announced that Sir William (later Lord) Beveridge had been requested to make a comprehensive survey of existing schemes of social insurance and allied services.

The seventh session was opened by the king on Nov. 12, 1941. During 1941-42, Sir Stafford Cripps became lord privy seal, leader of the house and a member of the war cabinet; Lord Beaverbrook and Arthur Greenwood both ceased to be members. Oliver Lyttelton became minister of production and was succeeded as minister of state by Richard Casey, who joined the war cabinet. Clement Attlee became secretary of state for the dominions. Additional ministries were established—the ministry of works and buildings (minister, Lord Portal) and the ministry of fuel and power (minister, Gwilym Lloyd George). In March 1942 Sir Stafford Cripps left on an important mission to India. Churchill described the cabinet proposals as "an attempt by a constructive contribution to aid India in the realization of full self-government." Sir Stafford failed to obtain agreement among the representatives of the Indian people on the suggestions put forward. In December the report by Sir William Beveridge was published.

The eighth session of the 37th parliament was opened by the king on Nov. 11, 1942. During the session Sir Stafford Cripps left the war cabinet and resigned his leadership of the house, becoming minister of aircraft production. His place in the war cabinet was taken by Herbert Morrison. Eden became leader of the house. Lord Woolton also joined the war cabinet as minister of reconstruction, an indication of the importance attached to postwar matters. A ministry of town and country planning was set up with William S. Morrison as minister. On March 3, 1942, the speaker, Captain E. A. Fitzroy, died and was succeeded by Colonel Douglas Clifton Brown. The victory in Africa, which signified the turning of the tide in favour of the Allies, was the occasion for congratulatory addresses to be moved in both houses on May 18. The favourable trend of the war was reflected in parliament by many debates on home affairs. The Catering Wages bill was introduced, proposals for the reform of the foreign service were approved and the Uthwatt, Scott and Barlow reports were all issued. An important debate took place on the Beveridge report.

On May 26 the question of the powers conferred on the executive for the war emergency was raised. Major Maurice Petherick (Conservative) initiated a debate on the following motion: "That this house admitting the necessity for war purposes of giving abnormal powers to the executive is of opinion that parliament should vigilantly maintain its ancient right and duty of examining legislation whether delegated or otherwise." This debate was negative, but subsequently a select committee was appointed to examine and report on procedure in connection with statutory rules and orders, and in Dec. 1944 the government announced the setting up of a sessional select committee to draw the attention of the house to any rules or orders with which it required the house to be acquainted. Thus did parliament insist on maintaining its traditional authority.

The ninth session was opened by the king on Nov. 24, 1943. Two new ministerial offices were instituted, primarily concerned with postwar reconstruction. Viscount Swin-

ton became minister for civil aviation and Sir William Jowitt minister for national insurance. The war cabinet lost one member when R. C. Casey was appointed governor of Bengal. A comprehensive new Education act reached the statute book. In May 1944, the government published a White Paper on its full employment policy. Lord Portal resigned his appointment as minister of works in order that his successor, Duncan Sandys, might be in the commons. With the relieving of the war emergency, by-elections began to be contested by members of splinter parties with marked success. A select committee under the chairmanship of Earl Winterton was set up to plan the rebuilding of the house of commons.

The Postwar Period.—The tenth session of the 37th parliament was opened with the usual wartime ceremony, on Nov. 29, 1944. The surrender of Germany was announced on May 8, 1945, and parliament immediately attended service at St. Margaret's, Westminster, and subsequently loyal addresses were presented to their majesties in the royal gallery. The fall of the coalition government was brought about by the resignation of Labour ministers and Liberal ministers who followed Sir Archibald Sinclair. Churchill resigned as prime minister on May 23 and became head of the "caretaker government" on May 29. On June 15 parliament was dissolved by the king. The state of the parties at the time of dissolution was: Conservatives 361, Liberal Nationals 27, National Labour 6, National 7, Labour 169, Liberals 18, Independent Labour Party 3, Independent 21, Communist 1, Commonwealth 3. The new parliament was elected under the provisions of a Redistribution act passed in 1944, enlarging temporarily the membership from 615 to 640. Special arrangements were made for the services to record their vote. After the general election the state of the parties was: Labour 393, Conservative 197, Liberal National 13, National 6, Liberal 11, Independent Labour Party 3, Independent 14, Communist 2, Commonwealth 1. Churchill resigned on July 26 and Attlee formed a Labour government on strictly party lines. The small war cabinet of wartime was replaced by one of 20 with 12 other ministers holding cabinet rank without being members of it. Colonel Clifton Brown (Conservative) was re-elected speaker in accordance with tradition, and Herbert Morrison became lord president of the council and leader of the house.

On Aug. 15, 1945, the king opened the 38th parliament in state. The date corresponded with the announcement of the unconditional surrender of Japan, and once again parliament went in procession to service at St. Margaret's. On Aug. 21 the king and queen again attended parliament to receive from both houses, in the presence of representatives of the dominions, the colonial empire and the United Nations, addresses of congratulation on victory. On Aug. 24 a select committee was appointed to consider procedure in the public business of the house and to report what alterations if any were desirable for its more efficient dispatch. On Oct. 24 an interim report was issued suggesting certain alterations in procedure particularly with regard to the committee stage of bills. A bill nationalizing the Bank of England passed through all its stages.

Two minor cabinet reconstructions were undertaken by the prime minister, the most important alteration being the elevation of A. Creech Jones to cabinet rank as the new secretary of state for the colonies. Though conversations of far-reaching importance were taking place in India, Egypt and Palestine, and many commitments were being made in regard to the establishment of a peace or-

ganization, the government passed a record amount of legislation. The most important bills were the Civil Aviation act, the Coal Industry Nationalization act, the National Insurance act, the National Health act and the Trades Disputes and Trades Union act. The government announced the continuation of conscription before prorogation of the initial term of the victory parliament on Nov. 6. The second session of the 38th parliament was opened by the king on Nov. 12, 1946.

The decade 1937-46 ended as it began, with momentous problems confronting parliament. What emerged, inasmuch as parliamentary government is concerned, was that the constitution was flexible enough to stand the strain imposed upon it, and that the British people through their elected representatives had maintained their control. Parrado y Garcia, Augustin

Cardinal Parrado y Garcia (1872-1946), Spanish prelate, was born Oct. 5, 1872, at Fuentes de Saldana in Valladolid province, Spain. He was ordained to the priesthood in 1895 and was professor of Latin, literature and theology at the Valladolid seminary. Later, he was appointed chancellor of the diocese of Astorga and Salamanca. Consecrated bishop of Palencia in 1925, he became an archbishop in 1934, with authority over the metropolitan see of Granada.

On Dec. 23, 1945, he was nominated to the Sacred college of cardinals and was proclaimed a cardinal at consistory, Feb. 18, 1946.

Cardinal Parrado died at Granada on Oct. 8, 1946.

Parri, Ferruccio

Parri (1890-), Italian statesman and politician, was born in Turin. A schoolteacher, Parri joined the army when Italy entered World War I, was wounded and decorated four times. After the war, he was assistant editor of the liberal newspaper, *Corriere della Sera*, but resigned in 1925 when its editor in chief had been replaced by a fascist. He opposed the Mussolini dictatorship, participated in an underground antifascist organization and spent a number of years in Italian prisons for his revolutionary activities.

During World War II, Parri headed a well-organized Italian partisan group. He helped establish the Action party, a mildly leftist group, and on June 17, 1945, he was designated to form a cabinet. His government contained representatives of the six major Italian parties. However, as real power was vested in the Allied military government, Parri's political authority was restricted. In the late fall of 1945, the conservative parties in the government provoked a crisis that resulted in Parri's ouster.

(Nov. 24) and his replacement as premier by Alcide de Gasperi. He resigned from the Action party, Feb. 11, 1946, because of its refusal to oppose "ideologies of extremist character and conservative and reactionary forces," and said he would form a new Republican party.

Patch, Alexander McCarrell, Jr.

Patch (1889–1945), U.S. army officer, was born Nov. 23, 1889, at Ft. Huachuca, Ariz., the son of an army officer. He was graduated from West Point in 1913. During World War I, he saw active duty in France and on his return to the U.S. became a member of the faculty at Staunton Military academy, Virginia, 1920–24. Promoted to the rank of major general in March 1942, Patch was placed in command of operations on Guadalcanal in Jan. 1943, when army troops relieved marines on the island; by the following month, the Japanese had been driven from the island. Patch then was transferred to the European theatre of operations and on March 21, 1944, was given command of the 7th army. On Aug. 16, the 7th army invaded southern France. Two days later Patch was named for promotion to the rank of lieutenant general. His forces established contact with Gen. George S. Patton's 3rd army north of Dijon, Sept. 11, 1944, and joined the combined assault on the reich. In 1945 the 7th army drove northward through the Vosges and the Siegfried line, over the Rhine and into Austria. Patch was replaced as head of the 7th army in June 1945 by Lt. Gen. Wade H. Haislip, and returned to the United States where he was given command (July 7) of the 4th army with headquarters at Fort Sam Houston, Tex. On Oct. 8 it was announced that he had been named head of a special board designed to study the size and requirements of the army of the postwar era. He died of pneumonia in San Antonio, Tex., Nov. 21, 1945.

Patents

In the ten years 1937–46 substantial changes were made in the patent laws of almost every important industrial country. In Germany, Denmark and the U.S.S.R. new patent statutes were enacted, and in Great Britain and the United States important alterations in the patent laws were effected. In France the patent term was enlarged from a 16-year term to a 20-year term.

Throughout the world the patent systems were under examination and study. In Great Britain, a departmental committee was appointed in April 1944 to report upon desirable changes in the patent law and its administration. That committee delivered reports in March 1945 and April 1946 which proposed fundamental changes in the examination practice in the British Patent office.

In the United States the patent system was one of the subjects under examination of the Temporary National Economic committee in 1938 and 1939, and that committee made several recommendations for changes in the patent laws. Many of these were enacted in 1939, among them the important provision that required the filing of a patent application within one year instead of two years after the invention had come into public use and sale or had become published. Subsequently several congressional committees undertook examination of various phases of

the patent system, and the president appointed the National Patent Planning commission, which continued from 1942 through 1945 and delivered three reports dealing with various phases of its study. These reports recommended the simplification of patent procedure, limitation of the term of patents and establishment of a separate administration of patents owned by the government. The final report of the National Patent Planning commission pointed out a large number of questions with respect to the patent law and recommended further study thereof.

In 1945 the secretary of commerce set up the Patent Survey committee to make a full and objective study of the operation and effectiveness of the patent laws and their relation to the antitrust laws and postwar economy.

World War II had serious effects upon the operation of the patent offices throughout the world. In many countries the physical equipment was destroyed, and in every country involved in the war there was serious interruption in the work of the patent office. The failure of communications throughout the world prevented most inventors from filing their applications in foreign countries under the international practices and required the passage of corrective legislation in every country. With the end of the war most patent offices were reduced in staff and were confronted with enormously increasing burdens of work caused by the undisposed accumulation of patent applications and increased flow of new applications. In several countries the increased flow exceeded that of any earlier period and indicated an expanded research activity throughout the world.

The seizure of great numbers of axis-owned patents by each nation introduced a new problem in their administration. In the United States, Great Britain and France these patents were made available for general licensing, and that policy was being advocated for general adoption throughout the industrial world. (C. W. O.)

Postwar Problems.—The task of restoring normal patent relations between the various countries after the war was necessarily one of considerable difficulty. For instance, all existing German-owned patents in Allied countries at war with Germany had been seized. To some extent the disposition of these patents was determined by an accord signed in London on July 27, 1946, which came into force on Nov. 30, 1946, between France, India, the Netherlands, New Zealand, the Union of South Africa, the United Kingdom and the United States of America. This accord, which was open to acceptance by all members of the United Nations and by neutral countries, provided for the German-owned patents to be made freely available to the nationals of all countries party to the accord, subject only to the protection of non-German interests in such patents existing on Aug. 1, 1946. Further, the United Kingdom adopted an act under which no patent could be obtained in that country for an invention made in Germany or Japan between Sept. 3, 1938, and Dec. 31, 1945.

The general resumption of normal patent relations between the various countries necessarily depended, as between belligerents, upon the peace treaties, and as between other countries upon arrangements made between themselves. An agreement was made on Aug. 29, 1945, between the United Kingdom and France for the restoration of rights in industrial property affected by World War II, and the Swiss government issued an invitation to all countries belonging to the Industrial Property union to attend a conference to open at Neuchâtel on Feb. 5, 1947, for the purpose of signing an agreement for the restora-

tion of industrial property rights affected by the war on the lines of that made after World War I and signed at Berne on June 30, 1920. In 1946 a number of countries were considering the revision of their patent laws; in Great Britain a committee appointed in 1944 for this purpose issued two interim reports. (See also LAW.)

Patterson, Robert Porter

Patterson (1891–), U.S. government official, was born Feb. 12, 1891, in Glen Falls, N.Y. A graduate of Union college, 1912, he took his law degree from Harvard, 1915, and practised law in New York city. He served in the Mexican campaign (1916) and in World War I, during which he rose to the rank of major and was awarded the D.S.C. Patterson was judge of the U.S. district court for the southern New York district (1930–39), becoming judge of the U.S. circuit court of appeals in 1939. He resigned from the appellate court in July 1940 after his appointment as assistant secretary of war and five months later became undersecretary of war. Following Henry L. Stimson's resignation on Sept. 18, 1945, Pres. Truman named Patterson as his successor to the post of secretary of war. The following month, Patterson proposed (Oct. 17) creation of a single department of national defense headed by a cabinet officer with authority over all the services.

Throughout 1945 and 1946, Patterson pleaded for a strong army and decried democracy's "fatal tendency" to forget the army after a war. He said such a lapse would prove dangerous because "there are millions who hate us and will fan any flame that starts up."

Patton, George Smith, Jr.

Patton (1885–1945), U.S. army officer, was born Nov. 11, 1885, in San Gabriel, Calif. He was graduated from West Point in 1909, beginning his army career as a second lieutenant of cavalry. He was aide-de-camp to General Pershing during the Mexican expedition in 1916–17, and again in England during 1917. In France he organized and led the 1st U.S. tank brigade and was wounded in action in Sept. 1918. An expert on mechanized warfare, he became commander of the 2d armoured division in Nov. 1940. On April 4, 1941, he was promoted to major general. Soon after Pearl Harbor, he was made corps commander in charge of both the 1st and 2nd armoured divisions and organized the desert training centre at Indio, Calif. Patton was commanding general of the western task force during the U.S. operations in Africa in Nov. 1942, and handled the landing of U.S. forces on the western coast of Africa. He was promoted to the rank of lieutenant general in March 1943, and led U.S. forces in the Tunisian and Sicilian campaigns. In both operations, Patton displayed boldness and daring and emerged as a colourful figure. He had several sobriquets, the most popular of which was "Old Blood and Guts." Patton had a short temper which frequently involved him in "incidents," and during the Sicilian campaign he fell into temporary disgrace for striking an enlisted man. Reprimanded by Gen. Eisenhower, he later apologized to all present at the episode. Eisenhower later placed Patton in command of the

General George S. Patton, Jr., mugging for photographers, and Lieutenant General James Doolittle, during a press conference at Los Angeles in June 1945

U.S. 3rd army which, during the fighting in France and Germany in 1944 and 1945, distinguished itself with spectacular drives through German lines. In the Ardennes battle, Patton helped to contain the German counterattack and to rescue the isolated garrison at Bastogne. His forces were whipping their way through Bavaria and western Austria when the war ended. Patton was nominated by Pres. Truman, April 17, 1945, to the rank of full general. In September, Patton minimized the slowness with which the de-nazification program was being carried out; he likened the nazi party to the losers in an election between Democrats and Republicans back home. Eisenhower removed Patton from command of the 3rd army and as military governor of Bavaria on Oct. 7, and put him in charge of the U.S. 15th army, whose function was to compile a tactical history of the war. Patton was injured in an automobile accident near Mannheim, Germany on Dec. 9, 1945, and died at a 7th army headquarters station hospital at Heidelberg the following Dec. 21.

Paul I

Paul I (1901–), king of the Hellenes, was born Dec. 14, 1901, the third son of King Constantine and Queen Sophia, sister of Kaiser Wilhelm II of Germany. Paul was married on Jan. 9, 1938, to Princess Frederika Louise, daughter of the Duke of Brunswick. They had three children, Princess Sophia (b. Nov. 2, 1938); Prince Constantine (b. June 2, 1940) and Princess Irene (b. May 11, 1942). During World War II, Paul fled with the royal family in 1941 to South Africa and then to England, where he made common cause with the Greek government in exile. He returned to Athens Sept. 28, 1946, with his wife and brother, who had been restored to the throne as George II.

On the death of George II, April 1, 1947, Paul assumed the throne as King Paul I, sixth king of the Hellenes.

Paulus, Friedrich von

Paulus (1890?–), German army officer, was a col-

onel in the German war office in 1935 and was raised to the rank of a general in 1939. During World War II, he was commander of the German 6th army in the Stalingrad operations. His force, estimated to number about 330,000 men, besieged the soviet garrison in Stalingrad in the late fall of 1942 and was in turn besieged by the red army in an offensive started in November of that year. In the historic battle a large part of his army was destroyed and the German marshal surrendered Jan. 31, 1943. In the next few days, the remainder of the German forces trapped in Stalingrad surrendered.

He was held prisoner by the soviet command and the following year, Moscow Radio broadcast (Aug. 14, 1944), an appeal to the German people by Paulus to "remove Adolf Hitler, establish a new state leadership which will end the war" and re-establish amicable relations with the reich's enemies.

The field marshal testified for the prosecution at the Nuernberg war trials, asserting that Goering, Keitel and Jodl were the men chiefly responsible for Germany's attack on the soviet union. He declared that when he joined the high command on Sept. 3, 1940, he found that an operational plan for war against the U.S.S.R. was already being prepared.

"Pay-as-you-earn" System

Peace Negotiations, World War II

During 1946, the first peace settlements in connection with World War II were negotiated. These were the settlements in respect of Italy, Rumania, Bulgaria, Hungary and Finland, all of which countries had played, in varying degrees, some part in the war before the Armistice with Germany was signed. Although treaties of peace with these former axis countries were of comparatively minor importance as compared with the treaties of peace with Germany and Japan, which had still to be negotiated, the peace settlements with the satellites of Germany deserve careful study both in themselves and also for the light thrown upon the principles likely to be followed in negotiating the settlements with Germany and Japan.

Procedure.—It will be remembered that the Potsdam declaration issued at the conclusion of the conference held in Berlin in July and Aug. 1945 provided for the establishment of a Council of Foreign Ministers, composed of the foreign ministers of the United Kingdom, United States, the U.S.S.R., France and China. The immediate task of this council was to draw up, for submission to the United Nations treaties of peace with Italy, Rumania, Bulgaria, Hungary and Finland and to propose settlements of territorial questions outstanding at the end of the war in Europe.

For the carrying out of these tasks the council was to be composed of members representing states signatory to the terms of surrender imposed upon the axis state concerned, France being deemed to be a signatory in respect of Italy. There was also provision that when the council was discussing a matter of "direct interest" to a state not represented on the council, such state would be invited to send representatives "to participate in the discussion and study of that question."

The Potsdam declaration therefore contained no specific reference to the holding of a peace conference of all the Allied nations which had waged war against axis countries concerned, and the degree of "participation" to which Allied countries other than those represented on the Council of Foreign Ministers would be entitled was not made clear.

During the first unsuccessful meeting of the Council of Foreign Ministers held in London in Sept. 1945 strong claims were put forward by some of the Allied countries not represented on the council for recognition of their right to play a substantial part in negotiating the treaties. In particular the Australian foreign minister, H. V. Evatt, pressed the view that countries which had played a substantial part in the war against the satellites of Germany should either be associated with the council for the purpose of drafting treaties, or alternatively, that decisions reached by the council should be submitted to a free and open conference of all belligerents, which would have power to modify the decisions of the council.

Subsequently the foreign ministers of the United Kingdom, the U.S. and the U.S.S.R. met at Moscow in Dec. 1945. This conference confirmed the agreement reached at Potsdam as to the composition of the Council of Foreign Ministers for the purpose of drafting the treaties, but in addition agreed that, when the treaties had been drafted, a conference should be convoked for the purpose of considering the drafts which had been drawn up. This conference was to consist of "the five members of the Council of Foreign Ministers, together with all members of the United Nations which actively waged war with substantial military forces against the European enemy states, namely, the U.S.S.R., the United Kingdom, the United States, China, France, Australia, Belgium, Byelorussian S.S.R., Brazil, Canada, Czechoslovakia, Ethiopia, Greece, India, Netherlands, New Zealand, Norway, Poland, South Africa, Yugoslavia, the Ukrainian S.S.R." The conference was to be held not later than May 1, 1946, and it was agreed that on its conclusion the Council of Foreign Ministers would draw up the final texts of the peace treaties after consideration of the "recommendations" of the conference.

In accordance with the decision reached at Moscow, the Council of Foreign Ministers commenced the work of preparing draft treaties, but owing to difficulties in reaching agreement on the major issues of the treaty with Italy, it was not until July that the council was able to reach a decision on a new date for the opening of the Conference of 21 Powers, viz., July 29. Even at this stage, difficulties arose owing to the insistence of the soviet representative that China should not be associated with the other members of the council in issuing invitations to the conference and that the council should draw up binding rules of procedure for the conference.

Eventually, however, it was agreed that China should not be associated with the issue of invitations and that the council should draw up draft rules of procedure for the conference, on the understanding that these would be subject to confirmation by the conference itself.

The Paris conference, therefore, opened on July 29, 1946, at the Luxembourg palace.¹ A Commission on Procedure was set up at an early stage to consider the draft rules submitted by the Council of Foreign Ministers; in this commission there were heated debates, chiefly on the issue of the voting procedure to be adopted by the conference.

The commission adopted the provisions for conference

¹The nations represented, with their heads of delegation, were: France (Georges Bidault), U.S.S.R. (Vyacheslav M. Molotov), United Kingdom (Clement R. Attlee), U.S. (James F. Byrnes), Australia (Herbert V. Evatt), Belgium (Paul-Henri Spaak), Brazil (João Neves de Fontoura), Byelorussian S.S.R. (M. A. Kisselev), Canada (W. L. Mackenzie King), China (Wang Shih-chieh), Czechoslovakia (Jan Masaryk), Ethiopia (Ato Akilou Abte-Wold), Greece (Constantin Tsaladaris), India (Sir Samuel Rungtadhan), Netherlands (Baron van Boetzelaar van Oosterhout), Norway (Halvard Lange), New Zealand (H.G.R. Mason), Ukrainian S.S.R. (Dmitri Manuilsky), Union of South Africa (Maj. Gen. Frank Theron) and Yugoslavia (Edvard Kardelj).

organization suggested by the Council of Foreign Ministers. There was to be a Plenary conference consisting of the leaders of all delegations, which would make final recommendations to the council. A General commission was established to assist the Plenary conference and co-ordinate the work of all subordinate bodies. Nine treaty commissions were set up to carry out detailed study of the terms of the draft treaties. The political and territorial articles were referred to Political and Territorial commissions, one for each treaty, and the economic articles to two Economic commissions, one in respect of Italy and one for the remaining countries. The military articles of all treaties were referred to a Military commission, while a Legal and Drafting commission was also established. All states were entitled to representation on the two latter commissions. The membership of the Political and Economic commissions was restricted to the members of the Council of Foreign Ministers who had drawn up the relevant draft treaties, together with the member states who were at war with the axis state in question.

The main issue before the Commission on Procedure was the question of the majority required for adoption of a recommendation by the Plenary conference. Under the draft rules put forward by the Council of Foreign Ministers a two-thirds majority vote was necessary. This provision was regarded by a number of Allied countries as so restrictive as to threaten to stultify the work of the conference as a whole. It was pointed out by these countries that the four members of the Council of Foreign Ministers had already committed themselves, before the Paris conference opened, to support all draft articles on which they had previously reached agreement. The voting and influence of these great powers would therefore automatically be given and exercised with a view to preventing any substantial amendments to such articles being carried. This meant that in practice the freedom of the conference to make recommendations was likely to be confined to the comparatively few articles on which the Council of Foreign Ministers had failed to agree.

An amendment to the draft voting rules was therefore moved under which only a simple majority would be required for the adoption of recommendations by the Plenary conference. In answer to strong opposition by the representative of the soviet union, who claimed that adoption of such a rule would involve departure from the procedure adopted at the San Francisco conference, the Australian representative emphasized that the San Francisco conference had been concerned with decisions, while the Paris conference could make only recommendations which the Council of Foreign Ministers could, if they so chose, refuse to accept. He argued therefore that acceptance by the Paris conference of the two-thirds majority voting rule would make it impossible for the conference to carry out its task satisfactorily. Indeed, there was danger that adoption of a two-thirds majority rule would make it impossible for the conference to make any firm recommendations at all.

After a protracted discussion, a compromise proposal was submitted by the United Kingdom delegation under which recommendations of the conference were to be of two kinds, namely, those adopted by a two-thirds majority, and those adopted by a simple majority. It was implied that, while there was justification for transmitting to the Council of Foreign Ministers both kinds of recommendations, recommendations which had been voted by a two-thirds majority would carry greater weight. This United

Kingdom proposal was eventually adopted by 15 votes to 6, the minority being the U.S.S.R., Byelorussia, Poland, Czechoslovakia, Yugoslavia and the Ukraine. When this matter came before the Plenary conference for decision, the soviet delegation maintained its strong opposition and formally proposed that the commission's recommendation should not be accepted. The soviet proposal, however, was rejected by the Plenary conference by a two-thirds majority.

It will be seen therefore, that the procedure adopted in the negotiation of the peace settlements with the satellites of Germany was a compromise between two opposing points of view. The members of the Council of Foreign Ministers accepted the soviet view that participation by the other Allied countries who fought in Europe and the middle east should be limited to an expression of views to the Council of Foreign Ministers which the latter could accept or reject. The other Allied countries, led by Australia, claimed that such an attitude failed completely to recognize the importance of their military contributions to the defeat of Germany and its allies. These contributions, it was argued, entitled them to the fullest participation in the peace settlement negotiations at all stages. In the result, the Council of Foreign Ministers was able to secure acceptance of its right to make final decisions on the treaties. Members of the council were compelled, however, to yield some ground. In the first place, a conference of Allied countries which waged war actively against the satellites of Germany was in fact held. This conference gave an opportunity to the smaller powers to express in detail their views on the drafts prepared by the Council of Foreign Ministers. Again, although this conference had the power to make recommendations only, it successfully resisted Great Power attempts to restrict such recommendations to those supported by a two-thirds majority of the conference. The fight for establishment of democratic procedures therefore was to some extent successful, and a precedent was established to which the smaller powers would no doubt draw attention as representing a minimum of their requirements in connection with the peace settlements with Germany and Japan.

Substance.—It is not possible to refer in detail to all the main provisions of the treaties with Italy, Rumania, Bulgaria, Hungary and Finland. It is desirable, however, to indicate the kinds of sections which were included in all of the draft treaties submitted by the Council of Foreign Ministers and to give a short account of certain important provisions, which gave rise to great debate.

All the treaties were constructed on the following similar lines:

(a) *Preamble*, indicating the reasons for and objectives of the treaties.

(b) *Territorial Section*, dealing with any frontier adjustments or cessions of territory. Thus, the treaty with Italy provided for an adjustment of the frontier between France and Italy in favour of the former, and laid down a new frontier between Yugoslavia and Italy known as the "French line." It also provided for the cession of certain islands in the Adriatic to Yugoslavia and of the Dodecanese Islands to Greece. In other treaties, provision was made for restoration of prewar frontiers, with the exception that the frontiers between Hungary and Czechoslovakia and between Bulgaria and Greece were not to be determined finally until representatives of these countries had had the opportunity to present their views before the Peace conference.

(c) *Political Section*. Articles in this section common to all treaties dealt with such matters as assuring basic human rights to all citizens, apprehension of war criminals and annulment of prewar bilateral treaties unless both parties wished them to remain in force. The treaty with Italy also contained articles dealing with the creation of the free territory of Trieste, the

disposal of Italian colonies and the special interests of China, Albania and Ethiopia. In the remaining treaties was an article providing for the dissolution of all "organizations of a Fascist type."

(d) *Military Section.* All the treaties contained similar articles providing for destruction of frontier fortifications and limitation of armed forces and production of armaments to a level consistent only with the necessities of local defense and the maintenance of internal security.

Military Provisions of the East European Treaties

	Army	Navy		Air Force†	
		men	tonnage	men	planes
Bulgaria	56,800*	3,500	7,250	5,200	90
Hungary	65,000†	5,000	15,000	5,000	90
Rumania	125,000*	5,000	15,000	8,000	150
Finland	34,400*	4,500	10,000	3,000	60

*Including AA troops. †Including AA troops and river flotilla personnel.
‡Including naval air arm, if any.

(e) *Claims Arising Out of the War.* This section contained articles on reparations, restitution of looted property and claims by former axis countries. The Council of Foreign Ministers had reached agreement on the amounts to be paid in reparations to the U.S.S.R. by Italy, Rumania, Hungary and Finland (although the United States reserved its right to reopen the question in the case of Finland) and to Czechoslovakia and Yugoslavia by Hungary. Reparations from Italy to countries other than U.S.S.R. were to be left for consideration by the Peace Conference, and reparations from Bulgaria to Greece and Yugoslavia until the question could be discussed with the governments of those countries.

(f) *Property Rights and Interests.* Provision was made for the restoration of legal rights and interests of the United Nations and their nationals and for the return of their property. No agreed draft article was submitted on the question of compensation for damage. The soviet delegate had maintained that compensation should be paid in part only while the remaining members of the council had pressed for compensation in full. The section contained a further provision enabling the United Nations to take over axis property within their jurisdiction to the extent necessary to satisfy outstanding claims.

(g) *General Economic Section.* All treaties contained a provision for the granting of most favoured nation treatment to members of the United Nations which adopted reciprocal measures. The soviet representative on the council had sponsored a provision that most favoured nation treatment should not apply in certain branches of industry not run by private enterprise. This provision was opposed by the remaining members of the council, who wished to see the most-favoured-nation principle observed in any case of state-controlled industry in which foreign participation was allowed.

In the treaties with Rumania, Bulgaria and Hungary the representatives of the United Kingdom, the U.S. and France wished to include an article providing for freedom of navigation on the Danube. The soviet representative considered that inclusion of such an article in the treaties was unnecessary.

(h) *Final Articles.* Common to all treaties were the articles providing for the execution of the treaties, settlement of disputes regarding interpretation (on which the soviet representative had presented a separate draft) and ratification.

In considering the texts of the draft agreement drawn up by the Council of Foreign Ministers, the Paris conference could either approve or amend the draft text, choose between alternative drafts of certain articles on which the council had not reached agreement, or propose entirely new articles.

In order to obtain a true picture of the proceedings and work of the conference, it is necessary to refer to particular proposals made at the conference even though many of these proposals were not adopted by the Plenary conference because they did not receive the requisite majority of votes. It would be misleading to refer merely to the records of the final meetings of the Plenary conference because these records would make it appear that most of the work of the conference had consisted in mere approval of drafts submitted by the Council of Foreign Ministers. In fact, few of the draft articles were not seriously and fully discussed or met with immediate unanimous approval. If there were few significant changes in the draft treaties

after consideration by the conference, this indicated merely the unsatisfactory nature of the conference procedure and did not reflect satisfaction by the 21 countries with the treaties as originally drafted.

Amendments to the Draft Treaties.—One of the major issues of the Italian treaty discussions was the attempt of the Yugoslav delegation to have the frontier with Italy, proposed by the Council of Foreign Ministers, altered in Yugoslavia's favour. It was only after protracted discussion that the council had agreed to accept the frontier known as the French line. When the matter came before the Political commission for Italy the Yugoslav delegate submitted a long and detailed amendment. Another amendment was moved by the Byelorussian delegate and supported by the delegates of Ethiopia and Poland, that the town of Gorizia should be wholly included in Yugoslavia. None of these proposals received general support in the commission. The Yugoslav delegate also proposed that the free territory of Trieste should be confined to a smaller area, while an amendment was put forward for the enlargement of the territory by the inclusion of the predominantly Italian areas of the west coast of the Istrian peninsula. After long debates, the commission rejected all amendments by decisive majorities. When the votes had been taken the Yugoslav delegate, who had previously stated that the Yugoslav government would not sign a treaty which had the French line as a frontier, affirmed his position by informing the chairman of the commission that Yugoslavia would not consider itself bound by any decisions on questions directly concerning it and to which it had not given its consent.

Another major amendment was moved by the Australian delegation in the Economic commissions. The delegation proposed that the reparation articles of all treaties should be altered to provide for determination by a Reparations and Restitution commission of the amounts to be paid. This decision would be made in accordance with the actual proved losses suffered by the claimant states and after account had been taken of the capacity to pay of the former axis country concerned. The delegation also proposed an alteration in the method of payment from current production.

Payments were to be made in dollars, sterling or other currencies approved by the commission to an annual amount to be calculated as a proportion of the annual exports of the axis country concerned.

The proposal came first before the Economic commission for the Balkan nations during consideration of the Rumanian treaty. It was opposed by the soviet delegate on grounds that Rumania had agreed to the sum fixed and that if the Australian plan was adopted it would result in the matter being left unsettled by the conference and thus hinder the recovery of areas in the U.S.S.R. damaged by the Rumanian army. The soviet delegate also suggested that it was an attempt to throw Rumania into the "pound-dollar net." Other members of the Council of Foreign Ministers also supported the agreed draft, stating that it was desired to avoid delay in fixing the reparations figure, and suggesting that in view of the various problems involved, it would be difficult to get precision as to the proper figure even after prolonged consideration. The proposal was not pressed in this commission, but was put to a vote in the Economic commission for Italy, where it was rejected by a decisive majority.

In the final meetings of the commission however, a modified proposal was put forward to establish a commission which would deal only with the question of repara-

PEACE TREATIES OF PARIS

TERRITORIAL CLAUSES CONTAINED
IN TREATIES WITH FINLAND, ITALY,
HUNGARY, RUMANIA AND BULGARIA,
SIGNED ON FEBRUARY 10, 1947.

FINLAND

- 1A Pechenga (Petsamo) area returned to U.S.S.R.
- 1B U.S.S.R. obtains 50-year lease on Porkkala.
- 1C U.S.S.R. renounces lease on Hangö (Hanko).
- 1D Åland Islands to remain demilitarized.

ITALY

- 2A Five small areas along French border ceded to France.
- 2B Free Territory of Trieste placed under U.N. supervision.
- 2C Zara, Adriatic Islands and greater part of Venezia Giulia ceded to Yugoslavia. Pelagosa to remain demilitarized.
- 2D Italy to recognize Albanian independence.
- 2E Italy renounces claim to Saseno Island.
- 2F Dodecanese ceded to Greece and to be demilitarized.
- 2G Italy renounces claim to Libya, Eritrea and Italian Somaliland. Final disposition of colonies to be determined by Big Four within one year after Peace Treaty comes into force.

HUNGARY

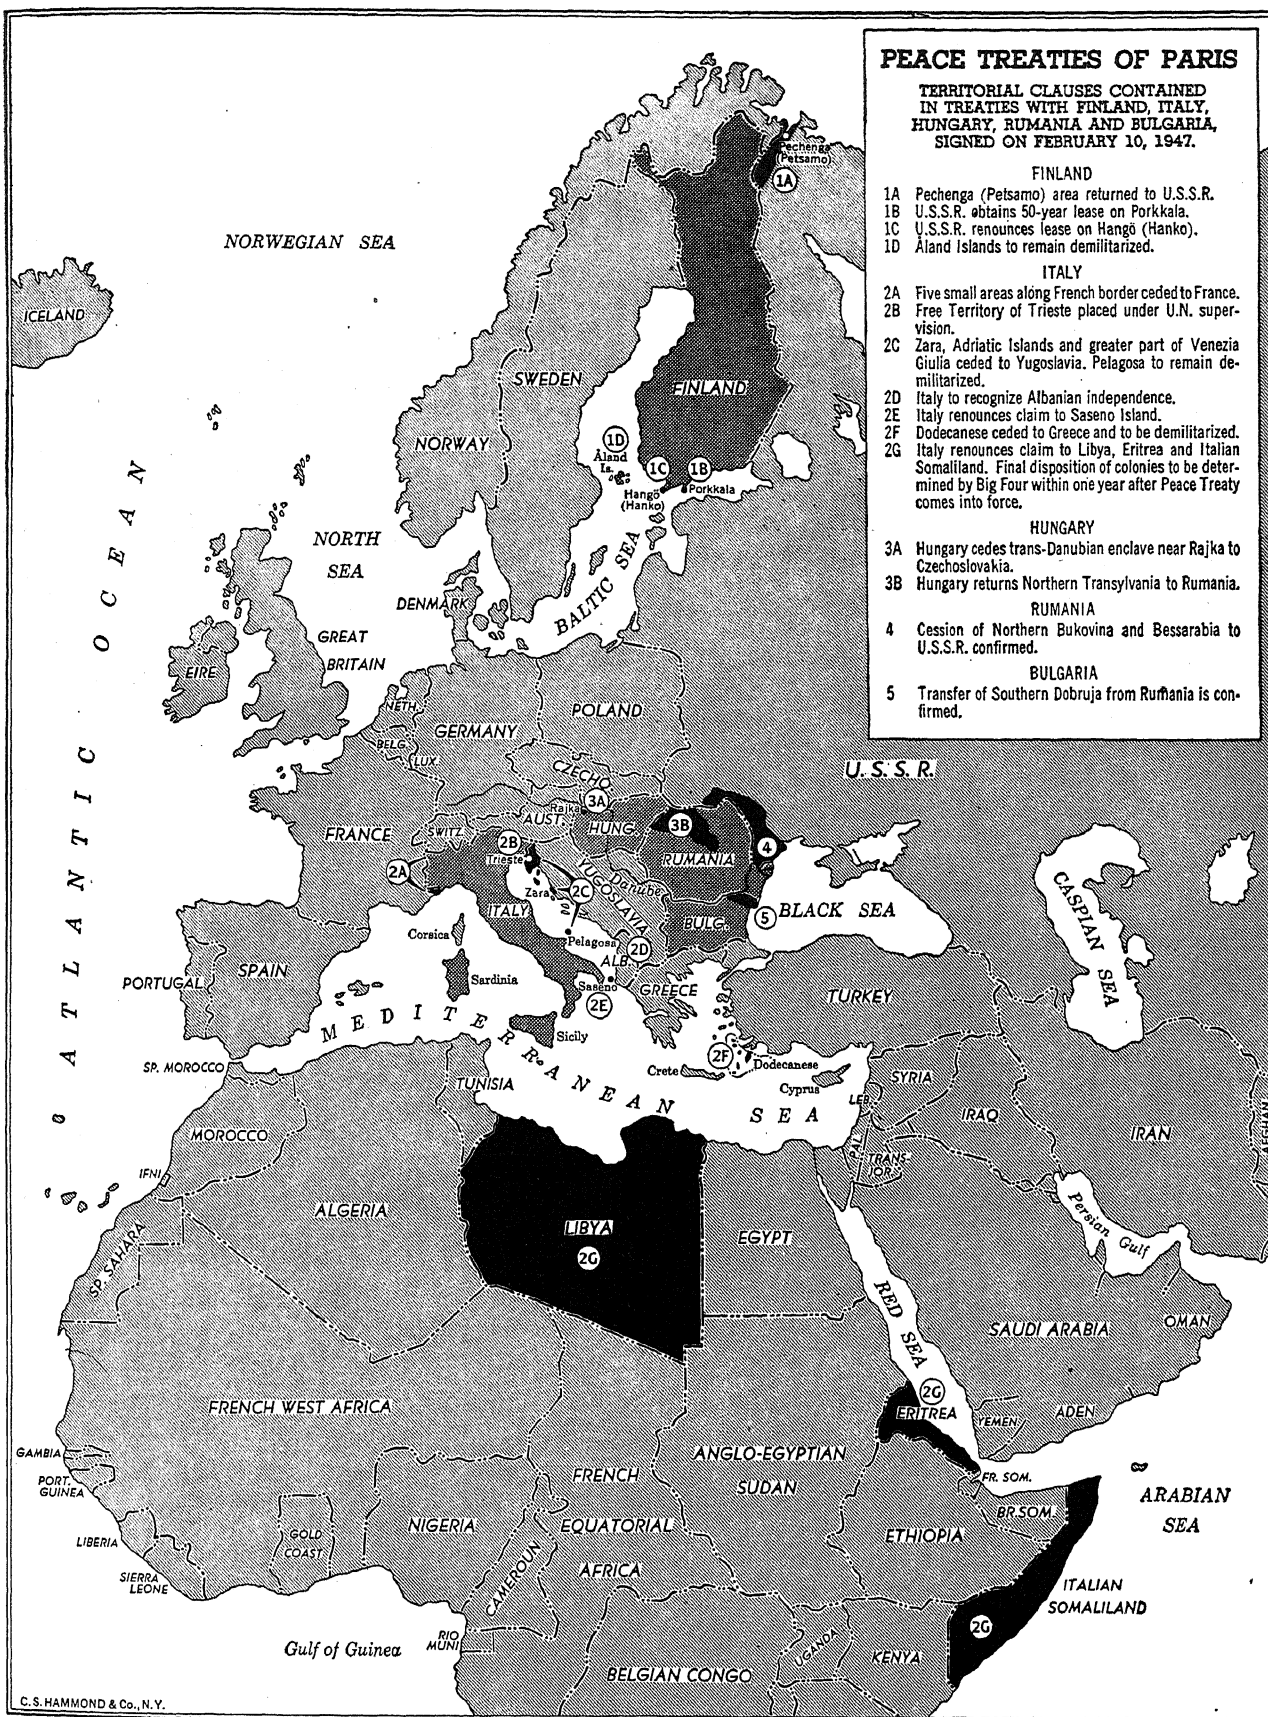

- 3A Hungary cedes trans-Danubian enclave near Rajka to Czechoslovakia.
- 3B Hungary returns Northern Transylvania to Rumania.

RUMANIA

- 4 Cession of Northern Bukovina and Bessarabia to U.S.S.R. confirmed.

BULGARIA

- 5 Transfer of Southern Dobruja from Rumania is confirmed.

tions to countries other than the U.S.S.R. and whose functions would be limited to the task of co-ordinating and supervising reparation payments. In its modified form, the proposal found more general acceptance, and was adopted by a simple majority.

Other amendments to the reparations articles were moved by the U.S. delegation. The draft article of the treaty with Hungary had specified that Hungary would pay a total of \$300,000,000 to the U.S.S.R., Czechoslovakia and Yugoslavia. The U.S. delegate, recalling that his coun-

try's representative on the Council of Foreign Ministers had reserved the right to bring the question up again at the Peace conference, proposed that in view of the precarious state of Hungary's economy, the total amount to be paid should be reduced to \$200,000,000. The proposal was defeated by 7 votes to 5, with 2 abstentions. A similar U.S. proposal to reduce the amount of reparations to be paid by Finland was ruled out of order by the chairman of the commission on the ground that it had been submitted too late.

New Proposals.—The fate of many of the proposed additions to the draft treaties was similar to that of the major amendments. It is true that the Political commission for Italy did accept, in the face of opposition from the soviet delegate, a proposal sponsored by the delegations of Belgium and the Netherlands that the treaty should contain formal recognition of an agreement between Italy and Austria regarding guarantees for the German speaking population of the Italian provinces of Bolzano and Trento. This commission, however, rejected a Polish proposal that an article should be included in the treaty, similar to those in the remaining treaties, prohibiting organizations of a fascist type. A Yugoslav proposal that, for the purposes of the treaty with Italy, Albania should have the rights of an associated power was also rejected.

Two other major proposals rejected by the conference were submitted by the Australian delegation. The first was a proposal to provide in the treaties for the establishment of a special court of human rights which would act as a supreme tribunal for the enforcement of those provisions of the treaties relating to citizenship and other human rights and fundamental freedoms. It was suggested that this court could be brought into special relationship with the Commission on Human Rights established by the Eco-

nomic and Social Council of the United Nations. In support of the proposal it was argued that unless the treaties themselves made available effective enforcement machinery, the basic rights conferred by the treaties might become a dead letter. The right of invoking the jurisdiction of the court, subject to reasonable conditions being laid down, would extend to individuals as well as to states, and its judgment would be accepted under the treaty as enforceable not only against individuals or groups, but also against states and local agencies.

The soviet delegation raised various objections to this proposal, suggesting *inter alia* that it was an infringement of the sovereign rights of the signatories to the treaty. The proposal was also criticized on the ground that the composition of the court and its procedure had not been made sufficiently precise and also on the ground that it was incomplete because if adopted it would result in the establishment of a European rather than a world court. Various delegations expressed sympathy with the proposal but considered that it was a matter for discussion in the United Nations rather than the Paris conference. The Australian amendment was rejected by 15 votes to 4.

The second major proposal was for the establishment of machinery for revision of the treaties. The Australian delegation proposed that an executive of the Paris conference should be set up consisting of the four members of the Council of Foreign Ministers who had prepared the draft treaties, together with three other belligerents nominated by the conference. This executive should have power by two-thirds majority to call a meeting of countries represented at the conference to consider revision of any portion of the treaty. If no treaty revision had taken place at the end of five years, a simple majority would be sufficient to decide that such a meeting should be called. The proposed revision however would be effective only when ratified by two-thirds of the nations represented at Paris, including the above-mentioned four powers. Although this proposal was defeated when raised in the final plenary session, 6 votes were cast in its favour and 3 countries abstained from voting.

Consideration of Articles on which no Agreed Draft was Submitted.—These articles fell into two categories, those on which a final decision on matters of detail was left to the conference, and those on which the Council of Foreign Ministers had been unable to reach any agreement at all.

In the first category, the most important issue was that of the future of Trieste. The council had agreed that the city with its immediate neighbourhood was to be constituted as a free territory, and that its independence and integrity were to be assured by the Security Council of the United Nations. Recommendations for a provisional government and for a permanent statute for the free territory were to be left to the Peace conference.

The council had appointed a special commission to consider the question and present preliminary suggestions to the Peace conference. Members of the commission had been unable to reach general agreement, and their suggestions were therefore presented to the conference in the form of four separate draft statutes. The drafts submitted by the representatives of the United Kingdom, the U.S. and France differed only in minor points, but all differed widely from that of the soviet representative. The position was further complicated by the submission of an additional draft statute by the Yugoslav delegation. The latter draft advocated the establishment of a special relationship between the free territory and Yugoslavia, under which the foreign relations of the free territory would be conducted

"The Kibitzer," a humorous picture of the very real anxiety with which Bulgaria, Hungary and other small nations followed the deliberations on European boundary changes at the 1946 Peace conference in Paris. Werner's cartoon from the *Chicago Sun*

by Yugoslavia, and which provided for customs, railways and postal unions between the two states.

The initial debate on Trieste in the Political commission for Italy emphasized the wide differences evident from the draft statutes, between the views of the western powers on the one hand and the U.S.S.R. and Yugoslavia on the other. The former affirmed that the free territory should be completely independent, and that in view of the existing political difficulties in Trieste, the governor of the free territory should have the power of veto over any measures passed by the legislative assembly and should also have certain reserve powers in regard to law and order. The latter insisted that power should reside in the legislative assembly and that the duties of the governor should be confined to supervision of the statute on behalf of the Security council.

The appointment of a subcommission to consider the draft statutes did little toward effecting a compromise, the subcommission being unable to present an agreed report. In the final debate in the full commission, an attempt was made by the Polish delegate to have the whole question referred back to the Council of Foreign Ministers. The attempt was unsuccessful and the commission was called upon to vote on three separate proposals submitted respectively by the French, U.S. and soviet delegates. The French proposal embodied the views favoured by delegates of the western powers, emphasizing the necessity for complete independence of the free territory and for some limitation on the powers of the legislative assembly in view of the governor's responsibilities to the Security council. The U.S. proposal concerned only the renunciation of Italian sovereignty over the free territory and the establishment of a provisional regime by the Security council. Both proposals were adopted by a two-thirds majority, in the face of opposition by the delegates of the U.S.S.R. and other eastern European states. The soviet proposal, except for two paragraphs which were common to the French proposal was rejected.

Although the conference did not completely fulfil its task of making recommendations for a provisional government and a permanent statute, it was significant that on this difficult issue it did provide a definite recommendation on the general principles on which the Council of Foreign Ministers were to work in completing details.

Another issue regarding which positive work was done by the conference was the question of the frontier between Hungary and Czechoslovakia. The Council of Foreign Ministers had agreed to the restoration of the 1938 frontier but had deferred confirmation of their agreement until the views of both governments concerned should have been heard either by the council or by the Peace conference. When the question came up before the Political commission for Hungary, the Czechoslovak delegate proposed that the frontier should be adjusted by the cession to his government of five village areas opposite Bratislava, capital of Slovakia. The Australian delegate, in accordance with the general policy of his delegation in territorial disputes, moved that a fact-finding subcommittee should be set up to consider the Czechoslovak claim and report the full facts to the full commission. The motion was adopted, and the subcommittee after full investigation recommended that the Czechoslovak claim should be upheld in respect of three villages only. The subcommittee was also entrusted with the consideration of a second Czechoslovak claim, that 200,000 Magyar inhabitants of the country be transferred to Hungary. On this question the subcommittee was able to bring about conversations between the parties to the disputes, with the result that it was able to recommend that

the question be left for negotiation at a later date. Both of the subcommittee's recommendations were accepted by the full Political commission.

Under the second category of articles on which no agreed drafts were submitted to the conference, the most important issues were those of compensation for damage to United Nations property in former axis countries and a future regime for the Danube. On the former question the soviet representative on the Council of Foreign Ministers had presented a draft demanding compensation at the rate of one third of the value of the property concerned, while the other three representatives had pressed for full compensation. During debate in the Economic commission for Italy, where the matter was first discussed, the U.S. delegate announced that his government no longer favoured full compensation and would submit a new proposal that the rate should be only 25%. This proposal was supported by the soviet delegate, but was defeated on a vote, as was the United Kingdom proposal for full compensation. Finally, a French compromise proposal was accepted that compensation should be paid at the rate of 75%.

On the question of the Danube, it will be recalled that the soviet representative on the Council of Foreign Ministers had been opposed to any reference to freedom of navigation in any of the treaties with Danubian states. In the relevant treaty commissions a soviet proposal to this effect was defeated, and the commissions accepted a French resolution covering freedom of navigation and providing for a conference to determine a future international regime for the Danube.

Final Meetings of the Plenary Conference.—The final business of the conference took place in plenary sessions from Oct. 5 to 15, when reports of the treaty commissions were considered and the recommendations of the conference to the Council of Foreign Ministers were made. After general speeches by delegates each treaty was put to the vote article by article. Delegations had the right to ask for a vote on any amendment or proposal even if it had not been accepted by the treaty commissions. There was, however, no significant change in the voting of the commissions.

At the final meeting, a letter was received by the chairman from the leader of the Yugoslav delegation in which the latter stated that in view of the unsatisfactory method adopted by the conference for reaching decisions, he felt unable to attend.

* * *

IN CONSIDERING the achievements of the Paris conference, it is necessary to keep constantly in mind the severe restrictions pointed out above under which it had to operate. This was not a conference empowered to take decisions on the substance of the treaties to be signed with the satellites of Germany. The conference had power only to make recommendations which the Council of Foreign Ministers could subsequently approve or disapprove as it thought fit. Moreover, the recommendations made by the conference based on a two-thirds majority or even a simple majority vote could be obtained only with great difficulty, because the four inviting Powers had undertaken to oppose any amendment put forward during the conference to those articles in the draft treaties on which all had previously agreed. This meant that for the most part four votes were automatically cast against recommendations for amendments of the draft treaties while the prestige and influence

of these countries affected substantially the votes of a number of other Allied countries.

Nevertheless, it can be said that the Paris conference had considerable value because the decisions of the Council of Foreign Ministers were put to the test of public criticism by a wide range of interested countries who had established their claim to criticize by their contribution to the war effort.

No account of the proceedings at Paris would be complete without a brief reference to the decisions taken subsequently at New York by the Council of Foreign Ministers on the recommendations made by the conference. The council made it quite clear that it felt free to reject recommendations of the conference if it thought fit. Thus, changes were made in the reparations figures which Greece and Yugoslavia were to receive from Italy and from Bulgaria respectively. Again, the conference recommendation that a conference should be called within six months of the coming into force of the treaties with Rumania, Bulgaria and Hungary to determine the regime to be established in relation to the Danube was rejected by the council, which decided instead to issue a Four-Power declaration on the subject.

On the other hand, a number of recommendations made by the conference were adopted by the Council of Foreign Ministers without alteration. Even on the contentious subject of Trieste, although certain changes were made, the council followed closely the principles of settlement recommended in Paris.

It could be said therefore, that the effect of the Paris conference upon the provisions of the treaties of the satellites of Germany was far from negligible. Indeed it was an important precedent which could be quoted in the future by those countries who claimed that a just and lasting peace could be established only if democratic procedures were adopted in the negotiation of the peace settlements. A public world forum was established at Paris, and the view subsequently expressed by countries like Australia was that the procedure at Paris could be expanded and extended when the final settlement came to be made with Germany and Japan.

Peaches

See FRUIT.

Peanuts

The total production of peanuts in the United States had been fairly stable from 1919 until 1940, when it became a war crop. The acreage had expanded slowly from about 1,700,000 ac. in 1919 to 2,500,000 ac. in 1937. An increasing proportion of the crop was harvested for the nuts as the demand for oil increased. The crushing of nuts in the United States was small until 1934, when farm prices increased from the low level of 1930-31. In that period the price dropped from the previous ten-year average of about five cents per lb. at the farm to less than one cent per lb.

After 1940, prices rose rapidly to over 8 cents per lb.—also the average in 1919. The development of food products such as peanut butter, candy and salted peanuts increased U.S. domestic consumption before World War II. Total production of peanuts was 1,232,755,000 lb. in 1937 and expanded to a record of 2,211,535,000 lb. in 1942—more than 150% above the prewar average, 1930-39. Another crop almost as large was harvested in 1945, but the output declined in 1946. The yield per acre varied widely from a

Hydraulic press producing peanut oil in Terrell county, Ga. A source of glycerine for munitions, production of the oil was speeded up during World War II

high of 857.7 lb. in 1940 to 607.7 lb. in 1943. The average of 1934-43 was 728 lb. per ac. The acreage grown for pig feed to be grazed amounted to about 1,000,000 ac. in 1937 and increased to a high of 1,970,000 ac. in 1943. Large acreages were grown for hay in Georgia and Alabama. The crop grown for nuts had long centred in Georgia and Alabama, which together produced about half of the United States total during the decade 1937-46. Texas and Oklahoma expanded the crop during the decade.

World production of peanuts increased steadily after World War I; frequently they made up the largest single vegetable oil crop. The world's production was estimated at 3,333,000 metric tons in 1909-13 and 7,901,600 metric tons in 1934-39. War needs stimulated an increase of about 10% above the prewar average. Most of this increase was in French West Africa. The leading countries in peanut production in the prewar period 1934-39 were India, China, French West Africa, United States and Nigeria in the order named. These countries produced about 85% of the world's production. Peanut oil, usually too costly for industrial uses, became a food of importance because of its high protein content. (See also VEGETABLE OILS AND ANIMAL FATS.) (J. C. Ms.)

Pearl Harbor Inquiries¹

At 7:55 A.M. Honolulu time (1:25 P.M. Washington time) on Sunday, Dec. 7, 1941, without a previous declaration of war, Japanese air forces launched from aircraft carriers attacked the United States naval base at Pearl Harbor in the Hawaiian Islands. The forces of the United States were not on the alert, and the attack was a complete surprise. Army aeroplanes were caught on the ground, parked wing tip to wing tip; many were not refuelled, and their guns had been removed for cleaning; pilots were on four-hour call. Land-based anti-aircraft guns were not manned, and were without ammunition readily available. A large part of the Pacific fleet was in the harbour, including eight of its nine battleships.

A Japanese naval force had left the Kurile Islands for Hawaii on Nov. 25 (Hawaiian time). Following a northerly route, it refuelled at sea, approached undetected within 600 mi. of Hawaii by the evening of December 6, and made a fast night run to a point about 200 mi. north of Oahu, from which its planes were launched. Waves of the attack continued for two hours, when the raiders withdrew and were recovered by the carriers and the Japanese

force then escaped to Japan. In the attack the Japanese lost 29 planes, 5 midget submarines and fewer than 100 men. U.S. military and naval forces suffered the loss of, or severe damage to, 188 planes, 8 battleships, 3 light cruisers, 3 destroyers and 4 smaller vessels and a total of 3,435 casualties in personnel. It was one of the greatest military and naval disasters in U.S. history.

The first inquiry into the disaster was by the Roberts commission, appointed by Pres. Franklin D. Roosevelt and headed by Justice Owen J. Roberts of the supreme court, the other members being Adm. William H. Standley (retired), Rear Admiral Joseph M. Reeves (retired), Maj. Gen. Frank R. McCoy (retired) and Brig. Gen. Joseph T. McNarney. The commission began proceedings Dec. 18, 1941, and concluded them on Jan. 23, 1942. On the evidence then available, its conclusions were that Lieut. Gen. Walter C. Short, commander of the Hawaiian department, and Adm. Husband E. Kimmel, commander in chief of the Pacific fleet and commander of the United States fleet, had failed to exhibit qualities needed for high command, and their errors of judgment were primarily responsible for the disaster. General Short and Admiral Kimmel were relieved of their commands, were not assigned to any other duty, and later were retired.

Other inquiries were by the army Pearl Harbor board, (July 20-Oct. 20, 1944) and the navy court of inquiry (July 24-Oct. 19, 1944). These inquiries were supplemented by four independent investigations; one by Adm. Thomas C. Hart, retired, and another by Adm. H. Kent Hewitt, for the navy department; and one by Col. Carter W. Clarke and another by Maj. Henry C. Clausen, for the war department.

For reasons of military security, all these inquiries, held during World War II, were behind closed doors, and much of the testimony was withheld from the public. Their conclusions were conflicting as to the relative responsibilities of the commanders at Pearl Harbor and the high command at Washington. Many stories were circulated, not only as to the conduct of high military and naval officers in Washington, but as to the responsibility of the civilian heads of state, war and navy departments, and Pres. Franklin D. Roosevelt. It was obvious after hostilities ceased that the public demanded a full and open inquiry, and in Sept. 1945 the congress passed senate concurrent resolution No. 27, 79th congress, first session, constituting a joint congressional committee on the investigation of the Pearl Harbor attack.

The joint committee was constituted as follows: Sen. Alben W. Barkley (Dem.), of Kentucky, chairman; Rep. Jere Cooper (Dem.), of Tennessee, vice-chairman; Senators Walter F. George (Dem.), of Georgia; Scott W. Lucas (Dem.), of Illinois; R. Owen Brewster (Rep.), of Maine; and Homer Ferguson (Rep.), of Michigan; Representatives J. Bayard Clark (Dem.), of North Carolina; John W. Murphy (Dem.), of Pennsylvania; Bertrand W. Gearhart (Rep.), of California; and Frank B. Keefe (Rep.), of Wisconsin.

The joint congressional committee commenced open hearings Nov. 15, 1945, which were concluded May 31, 1946. Fifteen thousand pages of testimony were taken, and 183 exhibits were received. Transcripts of all the testimony taken in the prior investigations were added to the record. The joint committee report was filed July 16, 1946. A majority report (492 printed pages), was signed by Senators Barkley, George and Lucas, and Representatives Cooper, Clark, Murphy, Gearhart and Keefe. A

¹Because of the highly controversial nature of this article, it was submitted in manuscript to army and navy officials, for their personal views, prior to publication. While expressing general agreement with the contents, one naval officer to whom the manuscript was submitted believed that the fault of Admiral Kimmel and General Short had been overemphasized as against that of officials in Washington; objection was also taken to the statement that U.S. naval forces were not on the alert at Pearl Harbor. Army comment was, *inter alia*, that the alleged blame of General Marshall had been too greatly stressed.—EDITOR.

minority report was submitted by Senators Brewster and Ferguson. Representative Keefe appended to the majority report a statement of additional views of his own.

The committee was unanimous in the conclusion that General Short and Admiral Kimmel were at fault. The majority report stated:

8. Specifically, the Hawaiian commands failed—

(a) To discharge their responsibilities in the light of the warnings received from Washington, other information possessed by them, and the principle of command by mutual co-operation.

(b) To integrate and co-ordinate their facilities for defense and to alert properly the army and navy establishments in Hawaii, particularly in the light of the warnings and intelligence available to them during the period Nov. 27 to Dec. 7, 1941.

(c) To effect liaison on a basis designed to acquaint each of them with the operations of the other, which was necessary to their joint security, and to exchange fully all significant intelligence.

(d) To maintain a more effective reconnaissance within the limits of their equipment.

(e) To effect a state of readiness throughout the army and navy establishments designed to meet all possible attacks.

(f) To employ the facilities, matériel, and personnel at their command, which were adequate at least to have greatly minimized the effects of the attack, in repelling the Japanese raiders.

(g) To appreciate the significance of intelligence and other information available to them.

9. The errors made by the Hawaiian commands were errors of judgment and not derelictions of duty.

The minority report contained substantially identical findings. The main differences of opinion within the committee were as to the extent that deficiencies and mistakes of high army, navy and civilian officials in Washington contributed to the disaster.

The majority report criticized the war plans division of

the war department for failure when war was imminent to make sure that General Short had alerted his command to possible air attack, found that the intelligence and war plans divisions of the war and navy departments had failed to evaluate properly information pointing to an air attack at Hawaii, and failed to be sufficiently alert Dec. 6 and 7 to evaluate intercepted Japanese messages indicating a Japanese attack at 1:00 P.M. Washington time (7:30 A.M. Hawaiian time) on Dec. 7. It placed no blame on the secretaries of state, war and navy, or on President Roosevelt. The minority report placed a measure of responsibility on the president, Secretary of War Stimson, Secretary of the Navy Knox as well as on Gen. George C. Marshall, chief of staff; Adm. Harold R. Stark, chief of naval operations; and Brig. Gen. Leonard T. Gerow, of the war plans division, mainly for deficiencies in organization and co-ordination of the military branches "particularly in the area of intelligence and unification of command." Representative Keefe, although signing the majority report, appended this criticism:

I feel that facts have been martialed, perhaps unintentionally, with the idea of conferring blame upon Hawaii and minimizing the blame that should properly be assessed at Washington. . . .

I cannot suppress the feeling that the committee report endeavors to throw as soft a light as possible on the Washington scene.

Admiral Richardson Episode.—In the spring of 1940 the Pacific fleet, then based on the U.S. Pacific coast, was sent to Hawaii on a training cruise. While there the president decided to shift its base to Pearl Harbor, believing that its presence there would be a deterrent to aggressive action by Japan in Asia. Adm. James O. Richardson, commander

Cordell Hull, testifying before the Pearl Harbor investigating committee in 1945, stated that on Nov. 27, 1941, he warned of a possible Japanese attack, but without specific mention of Pearl Harbor

in chief, United States fleet and Pacific fleet, vigorously protested, and insisted that the fleet be returned to the Pacific coast. He presented his protest to the president in person at Washington in Oct. 1940. As a result of this difference, Richardson was relieved of command in Jan. 1941, and was succeeded by Admiral Kimmel. The story had been circulated that Richardson had warned the president that the fleet was in danger at Pearl Harbor. The record later showed that Richardson, in his statement to the president and in a written memorandum to Secretary Knox, based his objections to keeping the fleet at Pearl Harbor entirely on the ground that the training facilities there were inadequate, and he made no suggestion that the fleet was in danger at Pearl Harbor. In a letter of Nov. 28, 1940, to Admiral Stark concerning the security of the fleet in the Hawaiian area, Richardson wrote:

This feature of the problem does not give me a great deal of concern, and, I think, can be easily provided for.

It was clearly established that the president did not place the fleet at Pearl Harbor as a bait for a Japanese attack, but solely for its deterrent effect on the Japanese.

Information that War was Imminent.—During 1941 diplomatic relations between the United States and Japan were becoming more strained. Washington was protesting against Japanese aggressions in Asia, especially in China. The diplomatic exchanges have been published by the state department in *Peace and War and Foreign Relations of the United States, Japan 1931-1941*. The most exact source of information available to the U.S. government as to Japanese intentions was intercepted and decoded messages between the Japanese government and its representatives in Washington and elsewhere. U.S. military and naval code experts had succeeded in "cracking" Japanese diplomatic and other codes. This work was "top secret" and conducted at Washington. It is enough here to begin with a message from Japan to the state department of Nov. 20, 1941. By that time the U.S. government had placed embargoes on shipment to Japan of war materials, including oil, and had frozen Japanese assets in the United States. It had also been furnishing war materials to China, without which the Chinese resistance would have collapsed. The message from Japan included the following demands:

4. The Governments of Japan and the United States mutually undertake to restore their commercial relations to those prevailing prior to the freezing of the assets.

The Government of the United States shall supply Japan a required quantity of oil.

5. The Government of the United States undertakes to refrain from such measures and actions as will be prejudicial to the endeavors for the restoration of general peace between Japan and China.

This meant not only the renewal of shipment of war material to Japan, but the cessation of aid to China and the abandonment of China to conquest by Japan.

Decoded messages from Tokyo to the Japanese ambassador in Washington stated that this was Japan's last proposal, and insisted that it be agreed to by the United States, as well as by Great Britain and the Netherlands, and set a deadline of Nov. 25, later extended to Nov. 29 Tokyo time. One such message, No. 736, intercepted Nov. 5, said:

Because of various circumstances, it is absolutely necessary that all arrangements for the signing of this agreement be completed by the 25th of this month.

Another, dated Nov. 11, said:

Judging from the progress of the conversations, there seem to be indications that the United States is still not fully aware of the exceedingly criticalness of the situation here. The fact remains that the date set forth in my message No. 736 is abso-

lutely immovable under present conditions. It is a definite dead line and therefore it is essential that a settlement be reached by about that time.

Another, dated Nov. 15, again said:

... the fact remains that the date set forth in my message No. 736 is an absolutely immovable one.

A third, dated Nov. 16, said:

... the fate of our empire hangs by the slender thread of a few days. . . .

In your opinion we ought to wait and see what turn the war takes and remain patient. However, I am awfully sorry to say that the situation renders this out of the question. I set the dead line for the solution of these negotiations in my No. 736, and there will be no change. . . . do not allow the United States to sidetrack us and delay the negotiations any further.

A decoded message of Nov. 22 from Japan to its ambassador said:

There are reasons beyond your ability to guess why we wanted to settle Japanese-American relations by the 25th, but if within the next three or four days you can finish your conversations with the Americans; if the signing can be completed by the 29th . . . we have decided to wait until that date. This time we mean it, that the dead line absolutely cannot be changed. After that things are automatically going to happen.

Bearing in mind that the Japanese expedition to attack Pearl Harbor sailed Nov. 25, the meaning of these messages later became unmistakable. Before Dec. 7, however, while not pointing to Hawaii as an object of attack, they did clearly show that the Japs intended to attack somewhere shortly after Nov. 29. To maintain as "top secret" the decoding of Japanese diplomatic messages, neither copies nor paraphrases of the above intercepted messages were furnished to Kimmel or Short. The evaluation of them made at Washington was reflected in the warning messages sent to Short and Kimmel Nov. 27. The real question was whether the evaluation reflected in the warning messages was an adequate one.

From Nov. 22 to Nov. 26 the president, Secretary of State Hull and high military authorities considered whether to temporize by proposing a *modus vivendi* to postpone a Japanese attack, to gain the time asked by General Marshall and Admiral Stark for further preparation for defense. The plan involved allowing shipments to Japan of limited quantities of oil, cotton and medical supplies. The Chinese protested, on the ground that any concessions to Japan would result in the collapse of China. Prime Minister Winston Churchill's comment was, "What about Chiang Kai-shek? Is he not having a very thin diet?" For these reasons, coupled with the belief that the decoded Japanese diplomatic messages showed that the Japanese would not consent to prolong negotiations, the *modus vivendi* was abandoned, and on Nov. 26 Secretary Hull gave the Japanese a message restating the U.S. position.

It later became clear that nothing the U.S. government could have said or done, after Nov. 20, short of a surrender of its position, would have prevented war. The Japanese were in a position in which they had to attack the United States to stop U.S. aid to China. It then seemed that Germany was about to crush Russia, and Japan had a reason to enter World War II before a German victory in order to make its western territorial claims against Russia as a cobelligerent. By Nov. 25, the authorities at Washington knew that war was imminent. Secretary Hull then warned the war and navy departments, and the president, that the "Japs mean to fight," that "a surprise attack might come at any moment," and the matter was "in the hands of the army and navy."

On Nov. 27 the navy department sent to Admiral Hart,

commander in chief of the Asiatic fleet, and to Admiral Kimmel, the following message:

This despatch is to be considered a war warning. Negotiations with Japan looking toward stabilization of conditions in the Pacific have ceased and an aggressive move by Japan is expected within the next few days. The number and equipment of Japanese troops and the organization of naval task forces indicates an amphibious expedition against either the Philippines, Thai or Kra peninsula or possibly Borneo. Execute an appropriate defensive deployment preparatory to carrying out the tasks assigned in WPL46. Inform district and army authorities. A similar warning is being sent by war department. Spenavo inform British. Continental districts Guam, Samoa directed take appropriate measures against sabotage.

This despatch was labelled for action by Hart and Kimmel and for information of other commanders.

On the same date the following despatch, signed "Marshall," was sent to General Short:

Negotiations with Japan appear to be terminated to all practical purposes with only the barest possibilities that the Japanese government might come back and offer to continue. Japanese future action unpredictable but hostile action possible at any moment. If hostilities cannot, repeat cannot, be avoided the United States desires that Japan commit the first overt act. This policy should not, repeat not, be construed as restricting you to a course of action that might jeopardize your defense. Prior to hostile Japanese action you are directed to undertake such reconnaissance and other measures as you deem necessary but these measures should be carried out so as not, repeat not, to alarm civil population or disclose intent. Report measures taken. Should hostilities occur you will carry out the tasks assigned in Rainbow Five so far as they pertain to Japan. Limit dissemination of this highly secret information to minimum essential officers.

A similar despatch was sent to General MacArthur in the Philippines, to the commanders on the Pacific coast and at the Panama Canal Zone.

General Short's only action was to alert his force at Hawaii against sabotage. Admiral Kimmel took no new precautions for defense of Pearl Harbor. In contrast, the commanders on the Pacific coast and at Panama, less exposed than Pearl Harbor, placed their forces on an all out alert against any form of attack. Hawaii was the only outpost that failed to institute a proper alert. Admiral Kimmel was not required to report measures taken. General Short sent the following reply:

Report department alerted to prevent sabotage. Liaison with navy.

On Dec. 3 the navy department sent Admiral Kimmel the following despatch:

Highly reliable information has been received that categorical and urgent instructions were sent yesterday to Japanese diplomatic and consular posts at Hongkong, Singapore, Batavia, Manila, Washington and London to destroy most of their codes and ciphers at once and to burn all other important confidential and secret documents.

Also the following despatch relating to Japanese codes:

Circular twenty four forty four from Tokyo one December ordered London, Hongkong, Singapore and Manila to destroy machine. Batavia machine already sent to Tokyo. December second Washington also directed destroy, all but one copy of other systems, and all secret documents. British admiralty London today reports embassy London has complied.

On Dec. 4, Admiral Kimmel received a copy of a despatch from the navy department to Guam ordering the destruction of secret and confidential publications.

While the authorities at Washington and the Hawaiian commanders knew by Nov. 27 that war was imminent and that the Japanese would attack somewhere, a clear distinction must be made between that information and information pointing to Pearl Harbor as the point of attack.

Possibility of Air Raid at Pearl Harbor.—In Nov. 1940 Admiral Stark asked Admiral Richardson for a report on the defense of Pearl Harbor against air attack. A report to the navy department prepared by Rear Admiral Claude C. Bloch, in command of the 14th naval district in Hawaii, disclosed that the defenses were inadequate. Thereafter, on Jan. 24, 1941, Secretary of the Navy Knox wrote to Secretary of War Stimson a letter, stating:

... If war eventuates with Japan, it is believed easily possible that hostilities would be initiated by a surprise attack upon the Fleet or the Naval Base at Pearl Harbor.

In my opinion, the inherent possibilities of a major disaster to the Fleet or naval base warrant taking every step, as rapidly as can be done, that will increase the joint readiness of the Army and Navy to withstand a raid of the character mentioned above.

The dangers envisaged in their order of importance and probability are considered to be:

- (1) Air bombing attack.
- (2) Air torpedo plane attack.
- (3) Sabotage.
- (4) Submarine attack.
- (5) Mining.
- (6) Bombardment by gun fire.

Defense against all but the first two of these dangers appears to have been provided for satisfactorily. The following paragraphs are devoted principally to a discussion of the problems encompassed in (1) and (2) above, the solution of which I consider to be of primary importance.

Both types of air attack are possible. They may be carried out successively, simultaneously, or in combination with any of the other operations enumerated. The maximum probable enemy effort may be put at twelve aircraft squadrons, and the minimum at two. Attacks would be launched from a striking force of carriers and their supporting vessels.

The counter measures to be considered are:

- (a) Location and engagement of enemy carriers and supporting vessels before air attack can be launched;
- (b) Location and engagement of enemy aircraft before they reach their objectives;
- (c) Repulse of enemy aircraft by anti-aircraft fire;
- (d) Concealment of vital installations by artificial smoke;
- (e) Protection of vital installations by balloon barrages.

The operations set forth in (a) are largely functions of the Fleet but, quite possibly, might not be carried out in case of an air attack initiated without warning prior to a declaration of war.

On Feb. 7, 1941, Secretary Stimson replied, expressing "complete concurrence" and discussing measures to improve army anti-aircraft defense. Copies of all these documents were furnished to Short and Kimmel.

From that time on the war department gave active attention to supplying additional fighter planes, anti-aircraft guns and radar detectors for the defense of Pearl Harbor, with the result, according to General Marshall, that in respect of those types of defenses Hawaii was relatively the best equipped station the United States possessed. The most serious deficiency was in long-range bombers suitable for long-range reconnaissance to detect the approach of a raiding force of carriers. Prior to Dec. 7, the desperate situation of the British caused the government to approve the delivery to them of hundreds of long-range planes, with only a dozen to the army at Hawaii. It was a deficiency in long-range army patrol planes to supplement his fleet patrol PBY's which later confronted Kimmel as war became imminent.

On Feb. 7 Marshall wrote to Short that he did not fear an enemy landing at Hawaii, but the real peril lay in sabotage and a surprise raid by air and by submarine. He stressed the point that Short's primary duty was the protection of the Pearl Harbor base and the Pacific fleet. Correspondence between Marshall and Short from Feb. to Oct. 1941 dealt with preparation against air attack.

On March 5, 1941, General Marshall wrote General Short:

I would appreciate your early review of the situation in the Hawaiian department with regard to defense from air attack. The establishment of a satisfactory system of co-ordinating all means available to this end is a matter of first priority.

In a letter to the chief of staff, dated March 6, 1941, General Short observed that the aircraft warning service was vital to the defense of the Hawaiian Islands. On April 14, 1941, General Short wrote the chief of staff, reporting on defense against an attack, and said:

The Navy has felt very much encouraged by the increase in our air and anti-aircraft defense.

On May 29, Short reported the result of war games, including a simulated air attack on Hawaii. On Aug. 19 General Marshall wrote Short, saying:

I feel sure that the Naval authorities comprehend fully the importance of adequate air defense of the Oahu Naval installation and accordingly, will entertain favorably any proposal which will implement the efficiency of such defense.

On Oct. 10 the chief of staff wrote Short, objecting to the latter's use of air personnel for ground duty, saying:

This seems inconsistent with the emphasis we are placing on air strength in Hawaii.

In March 1941 Captain P. N. L. Bellinger, commander naval base defense air force, and Major General Frederick L. Martin, commanding Hawaiian army air force, prepared a joint report covering joint army and navy air actions in the event of sudden hostile action against Oahu or fleet units in the Hawaiian area. It pointed out that "In the past Japan has never preceded hostile action by a declaration of war"; that "A successful sudden raid against our ships and naval installations on Oahu might prevent effective offensive action by our forces in the western Pacific for a long period"; and "It appears possible that Japanese submarines and/or a Japanese fast raiding force might arrive in Hawaiian waters with no prior warning from our intelligence service." Their report said:

It appears that the most likely and dangerous form of attack on Oahu would be an air attack. It is believed that at present such an attack would most likely be launched from one or more carriers which would probably approach inside of 300 miles.

Their estimate was that a dawn attack was the more likely, and that to avoid detection by Guam or Midway or task forces operating to the west, the Japanese would approach from the north or northwest.

In April 1941 General Short sent to the chief of staff a joint coastal frontier defense plan for army and navy forces at Hawaii, signed by General Short and Admiral Bloch, commanding the 14th naval district at Hawaii, to which was appended an agreement, approved by General Short, for joint defensive measures for defense of the Pearl Harbor base "against hostile raids or an attack delivered prior to a declaration of war." The army commander was to use planes, anti-aircraft guns and radar aircraft warning equipment. The navy's principal function was to conduct long-range air reconnaissance.

On April 1, 1941, the chief of naval operations at Washington sent to all naval districts the following dispatch:

Personnel of your naval intelligence service should be advised that because of the fact that from (sic) past experience shows the axis powers often begin activities in a particular field on Saturdays and Sundays or on national holidays of the country concerned, they should take steps on such days to see that proper watches and precautions are in effect.

In a letter of Aug. 20, 1941, to commanding general army air forces at Washington, transmitted through Gen-

eral Short, General Martin enclosed a copy of a report prepared by him on long-distance reconnaissance from Hawaii, which contained the following:

The Hawaiian Air Force is primarily concerned with the destruction of hostile carriers in this vicinity before they approach within range of Oahu where they can launch their bombardment aircraft for a raid or an attack on Oahu. . . .

Our most likely enemy, Orange (Japan), can probably employ a maximum of six carriers against Oahu. . . .

The early morning attack is, therefore, the best plan of action open to the enemy. . . .

It is the opinion of some individuals that a late afternoon attack is highly probable since it permits an enemy carrier to escape under cover of darkness. This presupposes that search operations are impracticable. This headquarters cannot subscribe to this opinion for the following reasons:

(1) A minor surprise raid such as a single carrier is not a logical method of attack to reduce the defenses of Oahu.

(2) It permits us to operate against him for a long period on D-Day at close range.

(3) The enemy will be more concerned with delivering a successful attack than he will be with escaping after the attack. He will have carefully considered the cost of the enterprise, will probably make a determined attack with maximum force and will willingly accept his losses if his attack is successful. . . .

The most favorable plan of action open to the enemy, and the action upon which we should base our plans of operation is the *early morning attack* in which the enemy must make good the following time schedule:

(1) Cross circle 881 nautical miles from Oahu at dawn of the day before the attack.

(2) Cross circle 530 nautical miles from Oahu at dusk of the day before the attack.

(3) Launch his planes 233 nautical miles from Oahu at dawn the day of the attack.

(4) Recover his planes 167 nautical miles from Oahu 2:30 after dawn the day of the attack. . . .

He (Japan) will not have unlimited avenues of approach for his attack.

a. He must avoid the shipping lanes to negate detection.

b. Any approach to Oahu which is made from east of the 158th meridian materially increases his cruising distance and the probability of detection by friendly surface vessels. It seems that his most probable avenue of approach is the hemisphere from 0° (due north) counterclockwise to 180° around Oahu; the next probable, the quadrant 180° counterclockwise to 90°; the least probable, 90° to 0°.

In Pacific fleet confidential letter from Admiral Kimmel to the Pacific fleet, issued Feb. 1941 and reissued in revised form Oct. 14, 1941, he said:

That a declaration of war may be preceded by—

(1) A surprise attack on ships at Pearl Harbor.

(2) A surprise submarine attack on ships in operating area.

(3) A combination of these two.

. . . it must be remembered too, that a single submarine attack may indicate the presence of a considerable surface force probably composed of fast ships accompanied by a carrier.

During 1941 war games conducted by the forces at Hawaii included defense against simulated air attacks by carrier planes. As late as the first week of Dec. 1941 Admiral Kimmel objected to sending marine anti-aircraft guns and gunners to islands farther west, on the ground that the equipment was needed for defense at Oahu.

Long before Dec. 7, 1941, it was known that the main campaign of the Japanese would be toward Indo-China, the Dutch East Indies and Malaya. If a surprise attack was to be made, it was not there. An attack on the Philippines was almost certain. In retrospect it seemed clear that for a daring surprise attack at the outset of hostilities, there were two tempting targets between which the choice lay—the Panama canal and the Pacific fleet at Pearl Harbor, with the latter preferred because it was more accessible, and because success there would relieve the Japanese

force moving down the Asiatic coast from the menace of a powerful fleet on its flank.

On this record it is hard to understand why, at the last, the possibility of an air attack faded from the minds of the commanders at Hawaii, as well as those at Washington. As Dec. 7 approached, they seemed to have concluded that such an attack was quite improbable. The dominant view was that chances of discovery and loss of the attacking force presented too great a hazard to Japan. Added to this was the mistaken view that the Japanese navy and naval air force were not sufficiently equipped or trained to deliver an attack. Only if U.S. forces had been alert would it have been too hazardous a venture; but Hawaii was not alert and the Japanese knew it, as their agents in Hawaii had every facility for communicating with Tokyo. The Japanese commander of the striking force had orders to return to Japan without executing the attack, if his force was detected prior to Dec. 6. If the Japanese force was detected on Dec. 6, the Japanese commander was to use his judgment whether to attack.

Of extreme significance were two messages of Dec. 6 (not translated until Dec. 8) from Japanese agents at Hawaii to Tokyo, one of which read as follows:

Re the last part of your No. 123.

1. On the American continent in October the Army began training barrage balloon troops at Camp Davis, North Carolina. Not only have they ordered four or five hundred balloons, but it is understood that they are considering the use of these balloons in the defense of Hawaii and Panama. Insofar as Hawaii is concerned, though investigations have been made in the neighborhood of Pearl Harbor, they have not set up mooring equipment, nor have they selected the troops to man them. Furthermore, there is no indication that any training for the maintenance of balloons is being undertaken. At the present time there are no signs of barrage balloon equipment. In addition, it is difficult to imagine that they have actually any. However, even though they have actually made preparations, because they must control the air over the water and land runways of the airports in the vicinity of Pearl Harbor, Hickam, Ford and Ewa, there are limits in the balloon defense of Pearl Harbor. I imagine that in all probability there is considerable opportunity left to take advantage for a surprise attack against these places.

2. In my opinion the battleships do not have torpedo nets. The details are not known. I will report the results of my investigation.

The other message of Dec. 6 from Honolulu to Tokyo reported, among other things, "it appears that no air reconnaissance is being conducted by the fleet air arm."

The commanders at Hawaii were aware that the Japanese probably knew that U.S. forces were not alerted. It was a fair inference that if they had been fully alerted, and daily air reconnaissance had been made toward the north and northwest, the Japanese would have known it and might have recalled the attacking force.

The joint committee found that the most serious error of judgment on the part of Admiral Kimmel was in failing, after the warning messages of Nov. 27, to conduct daily long-range air or other reconnaissance to detect the approach of enemy forces. The plans for joint defense of Pearl Harbor against air raids provided that long-range air reconnaissance should be conducted by the navy, with its available patrol planes, but long-range army bombers would be made available to aid the navy patrol. In the week before the attack, only six serviceable army bombers were available. The fleet had between 60 and 70 patrol bombers. These were too few to cover the whole perimeter of 360°, but were enough to have covered a sector of 120° to the north and northwest, the area named by the Martin-Bellinger estimate as that from which an air raid was most

probable, and the area from which the attack did come. The existing plans in case of war with Japan contemplated use of the Pacific fleet for raids to the west on the Marshall Islands. Admiral Kimmel concluded that the wear and tear on his limited force of planes and crews from long-range reconnaissance around Hawaii would impair the fleet's capacity to carry out its missions to the west, and that the danger of an air raid on Pearl Harbor was not great enough to justify a reconnaissance even in the limited sector. The navy board exonerated Kimmel of blame for this decision. After Nov. 27, Kimmel and Short risked the safety of the fleet on their judgment that no air attack would be made.

The difference from a military point of view between the responsibilities of a commander in the field and those of the general staff at Washington was stated by Secretary of War Stimson in his review of the report of the army Pearl Harbor board. Referring to the Washington end, he said:

A keener and more imaginative appreciation on the part of some of the officers in the War and Navy Departments of the significance of some of the information might have led to a suspicion of an attack specifically on Pearl Harbor. I do not think that certain officers in the War Department functioned in these respects with sufficient skill.

In this connection, the marked distinction between the character of the responsibility resting on the war plans division and that reposing in General Short was expressed by Secretary Stimson as follows:

It must clearly be borne in mind that in November and December 1941 the responsibilities of the War Plans division covered many fields and many theaters. Their preoccupation with the theaters most likely to be threatened, such as the Philippines toward which the Japanese activities then appeared to be pointed, may be subject to criticism in the light of the subsequent disaster, but it is understandable. All signs pointed to an attack in that direction, and they were exercising particular care with respect to that theater. Their conduct must be viewed in an entirely different light from that of the theater commander, such as General Short, who was like a sentinel on post and whose attention and vigilance must be entirely concentrated on the single position which he has been chosen to defend and whose alertness must not be allowed to be distracted by consideration of other contingencies in respect to which he is not responsible.

Unity of Command.—The command responsibility at Hawaii was divided. Striking evidence of this was given to the Roberts commission.

General Short testified that under the agreed plan for joint defense it was the navy's duty to conduct long-distance air reconnaissance to detect approaching enemy forces, and he assumed Admiral Kimmel was doing that. To the inquiry whether he had asked Admiral Kimmel about it, he replied that he had not, as the latter would have "resented" such a question. Admiral Kimmel said he assumed the army was on the alert and that its radar detection apparatus was in operation. To the inquiry whether he had asked Short about that, he replied "it would not have set well" with General Short to be checked up on his operations.

Previous to the attack General Marshall had attempted, through the army and navy joint board, to bring about an agreement for unified command at U.S. outposts. Both branches of the service agreed that should be arranged, but they were unable to agree on a basis for deciding whether the commander at any place should be a naval or army officer. Brig. Gen. Leonard T. Gerow reported to General Marshall the failure of these negotiations; the matter was dropped. It became obvious later that the controversy should have been submitted to and settled by the

president, and unified command in U.S. outposts arranged, as was done too late, shortly after Dec. 7. Both Short and Kimmel believed that an air raid would not be attempted. Their opinions reacted on each other. If one officer had been in command and solely responsible, he might have feared to risk omitting precautions against a raid.

Organization of Intelligence.—The joint committee pointed out the inadequate organization of U.S. intelligence services as a contributory cause of the disaster. Information was collected by the state department, the office of naval intelligence, the military intelligence division of the war department (G-2), the Federal Bureau of Investigation and other agencies, but there was no central office in which all this information could be evaluated by an adequate force of gifted and well trained officers. If in such an office all available information had been marshalled and weighed, and all intercepted Japanese messages had been promptly decoded, the danger of an air raid on Pearl Harbor might have been realized.

The Short Reply.—On receipt of the warning message of Nov. 27 from Marshall, General Short had immediately replied, as noted above, that his command had been "alerted to prevent sabotage. Liaison with navy."

His main defense was that this disclosed an alert against sabotage only, and in the absence of further instructions he had a right to assume that his action was approved. General Gerow at Washington made the mistake of assuming that Short's report was in reply to a message from Gen. Sherman Miles, head of army intelligence, warning the Hawaiian command of danger from sabotage. The record indicated that Col. Charles W. Bundy, assistant chief of the war plans division, considered that the message of Nov. 27 ordered Short to conduct a reconnaissance; that the only reconnaissance by the army possible from an island was by air; that the agreement for a joint defense against an air attack called for action by the navy to aid which the army was to furnish such long-range bombers as were available, and therefore the phrase "liaison with navy" meant that Short was doing more than alert against sabotage. The Short reply was ambiguous, and the war plans division was criticized by the joint committee for not making sure that Short was alerted to an attack from without.

Bombing Plot Message.—In Sept. 1941 a message from Japan to its consulate in Hawaii was intercepted and decoded at Washington. It read as follows:

Strictly secret.

Henceforth, we would like to have you make reports concerning vessels along the following lines insofar as possible:

1. The waters (of Pearl Harbor) are to be divided roughly into five subareas. (We have no objections to your abbreviating as much as you like.)

Area A. Waters between Ford Island and the Arsenal.

Area B. Waters adjacent to the Island south and west of Ford Island. (This area is on the opposite side of the island from Area A.)

Area C. East Loch.

Area D. Middle Loch.

Area E. West Loch and the communicating water routes.

2. With regard to warships and aircraft carriers, we would like to have you report on those at anchor (these are not so important) tied up at wharves, buoys, and in docks. (Designate types and classes briefly. If possible we would like to have you make mention of the fact when there are two or more vessels along side the same wharf.)

Other intercepted messages containing reports on ships in Pearl Harbor were sent from Tokyo to Hawaii Nov. 15, 20 and 29, and were translated Dec. 3, 4 and 5, respectively.

Admiral Kimmel placed stress on the fact that he was not furnished with copies, and that the messages called for information only useful for an air raid on the fleet.

Officers at Washington who saw the messages did not so construe them, and were so little impressed by the messages that they had forgotten having seen them. They testified that they were similar to many others in which the Japanese asked for information as to ship movements and location of vessels at many other points. They were laid aside as of no special significance. The joint committee found that the Hawaiian commanders should have been informed of the contents of these messages.

The Last Hours.—As Dec. 7 neared, some incidents occurred which, if properly evaluated, gave what in legal parlance is known as a "last clear chance" to avert or minimize the disaster.

A radio direction finding service was in operation in the Pacific area, which could locate Japanese war vessels whose radio call numbers were known, and which sent out radio messages. Frequent reports of location of Japanese vessels were available to Admiral Kimmel at Hawaii. The Japanese had eight carriers. After Nov. 25 (the day the task force, including six carriers, left Japan for Hawaii) the direction finding system lost track of several carriers. On Dec. 2, Lieutenant Commander Edwin T. Layton, of Kimmel's staff, reported this to Admiral Kimmel in person. The alternative assumptions were that the carriers were either in home ports, or at sea on a secret expedition, maintaining radio silence. Layton testified that Admiral Kimmel then said: "Do you mean to say that they could be rounding Diamond Head and you wouldn't know it?", and Layton replied, "I hoped they would be sighted before now." The radio direction finding reports of Dec. 4, 5 and 6 reiterated the statement that the carriers could not be located.

On Dec. 6 the Federal Bureau of Investigation at Honolulu intercepted a transpacific radio telephone conversation between a person in Japan and one Mori, a man in Hawaii suspected of being a Japanese agent. It indicated that Japan wanted information as to whether daily flights of large planes were being made from Hawaii, whether search lights were being used and as to the number of ships in Pearl Harbor. Other parts of the conversation contained words having a hidden meaning. The Federal Bureau of Investigation agent was alarmed at what he considered the military implication of the message with respect to Pearl Harbor, and Lt. Col. George W. Bicknell (assistant G-2) agreed with him. Bicknell insisted on taking the message immediately to General Short, who delayed an evening dinner engagement to receive it. General Short informed Bicknell that the latter was too "intelligence conscious" and that the message was "nothing to be excited about."

The Martin-Bellinger report had suggested that the presence of Japanese submarines near Pearl Harbor would indicate the approach of a raiding force with aircraft carriers. On Dec. 7, at 3:42 A.M., a submarine periscope was reported sighted off the entrance buoys near Pearl Harbor. At 6:30 A.M., a small submarine was observed off Pearl Harbor. It was fired on, and a navy plane dropped depth charges and sank it. These facts were reported to shore stations, and news of the sinking reached Admiral Kimmel's duty officer at 7:15 A.M., and Admiral Kimmel at 7:30. Previous unverified reports of the presence of Japanese submarines had been received, and verification of these reports of Dec. 7 was awaited. No alert followed, because the attack began before the reports were verified.

The army radar detection service had been operating only on a training basis from 4:00 to 7:00 A.M. Sundays.

Five mobile stations were available. They were closed down at 7:00 A.M., but at one station two enlisted men continued operation. At 7:02 the instruments indicated the approach of a large fleet of planes from the north. That fact was reported to the central office, where only a junior lieutenant remained on duty, and he instructed the enlisted men to "forget it." This information was not even used to locate the escaping Japanese carriers.

Meanwhile at Washington, on Dec. 6, the navy department began intercepting a long code message from Japan to its ambassador at Washington for delivery to Secretary of State Hull. The message was in 14 parts. By 10:00 P.M., the first 13 parts had been intercepted and decoded, and copies were delivered to the president, to Secretary Knox and officers of naval intelligence. These 13 parts discussed the American statement presented by Hull on Nov. 26. Their tone indicated that Hull's proposals were not acceptable to Japan. They tended to confirm, but added little to, the previous information that negotiations were ended and that war was imminent. Nothing in them pointed at Pearl Harbor as a target for attack. After midnight the 14th part and a supplemental message were intercepted, the decoding and translation of which were not completed until 8:00 A.M. Dec. 7th. The 14th part stated that negotiations between the 2 governments were at an end. The supplemental message was an instruction to the Japanese ambassador to deliver the message to the secretary of state at 1:00 P.M., Washington time, Sunday, Dec. 7. The staff officers on duty at the war and navy departments made no special effort immediately to deliver these messages to Marshall or Stark. Copies of the 14th part and the 1:00 P.M. message reached the White House at about 10:30 A.M., and reached Admiral Stark, chief of naval operations, about the same time. Duty officers at the war department telephoned General Marshall's home, but he was riding horseback, and no attempt was then made to locate him. He arrived at the war-department about 11:30 A.M., and then received copies. Up to that time no one seems to have caught the significance of the 1:00 P.M. delivery message. One P.M. at Washington was about 7:30 A.M. at Honolulu. General Marshall immediately prepared a message to General Short and other outpost commanders, as follows:

The Japanese are presenting at 1 P.M. eastern standard time today, what amounts to an ultimatum. Also they are under orders to destroy their code machine immediately. Just what significance the hour set may have we do not know, but be on the alert accordingly. Inform naval authorities of this communication.

The message was encoded and delivered to the message centre for transmission at 12:01 P.M. (6:31 A.M. Honolulu time). Because of static the army radio could not contact Pearl Harbor, and resort was had to Western Union and R.C.A., and the message arrived at the Honolulu office of R.C.A. at 7:33 A.M. Hawaiian time. Before delivery to General Short the attack had begun. Because of the state of unreadiness at Pearl Harbor, the delivery of that warning shortly before the attack could only have mitigated the damage. So the blow fell.

Peat

The use of peat as a fuel replacing scarce coal supplies led to outputs running into millions of tons in U.S.S.R., Eire and Denmark; outputs ranging from 100,000 tons to 1,000,000 tons were made in Finland, the Netherlands, Norway, Sweden and Switzerland, with smaller amounts in several other European countries. In the United States peat continued to be used chiefly as a soil conditioner. Production was 51,223 short tons in 1937, and imports 86,871. As shipment from Europe became impossible during World War II, U.S. production increased, supplemented by imports from Canada. Output rose to 86,503 tons in 1941, but declined to 57,987 tons in 1944, increasing to 78,272 tons in 1945. At the same time, imports declined to 21,689 tons in 1940, and increased to 77,673 tons in 1945.

Canadian production included a few hundred tons for fuel, but the bulk of the output continued to be peat moss, much of it exported to the United States. Production increased from 17,217 tons in 1940 to 83,974 tons in 1945.

Peek, George Nelson

Peek (1873-1943), U.S. industrialist and government official, was born Nov. 19, 1873, in Polo, Ill. After graduating from the Oregon (Ill.) high school in 1891, he attended Northwestern university. He entered private industry in 1893 and served as executive of several agricultural implement companies until 1923. In 1918 he was with the War Industries board as commissioner of finished products. The following year he acted as chairman of the industrial board in the U.S. department of commerce. As president of the American Council of Agriculture, 1925-28, Peek gained a knowledge of farm problems which proved valuable when he was appointed administrator for the newly formed Agricultural Adjustment administration in May 1933. In 1934-35 he acted as special adviser on foreign trade to President Roosevelt while serving as head of the Export-Import Bank of Washington. He died near San Diego, Calif., on Dec. 17, 1943.

Peel Commission

See PALESTINE.

Peiping

After the removal of China's capital from Peking (officially renamed Peiping) to Nanking in 1928, Peiping became the principal cultural and residential centre in North China. The population was estimated at 1,550,561 in March 1945.

On July 7, 1937, Japanese troops opened fire on the

Chinese army at Lukouchiao (Marco Polo bridge) in the suburbs of Peiping. This incident marked the beginning of the second war between China and Japan.

The Chinese army evacuated Peiping on July 28–29 1937. The Japanese, on Dec. 14 of the same year, inaugurated in Peiping a puppet regime known as the "Provisional Government of the Republic of China." After the establishment of the puppet regime in Nanking in March 1940, the Japanese-sponsored regime in Peiping came to be known as the "North China Political Council." From the time of its fall until the end of World War II in Sept. 1945, Peiping was one of the main centres of Japanese activities in North China, the city being well served with railways and highways linking it with Manchuria, Mongolia, Nanking, Hankow and Shanghai.

During the Japanese occupation, all schools and universities operated by the Chinese government were either suspended or removed. The American missionary-supported Yenching university remained, but was also forced to close down after Pearl Harbor. Students were compelled to attend schools and universities operated by the Japanese-sponsored regime. Many university campuses were requisitioned by the Japanese army.

Peiping did not sustain direct war damages, but it was sadly neglected. During the war, the population of Peiping increased considerably. This increase was largely due to the lack of law and order in the countryside, resulting in acute food and fuel shortages.

On Oct. 10, 1945 (China's national anniversary day), the Japanese garrison in Peiping formally surrendered to General Sun Lien-chung of the Chinese army in front of historic Tai Ho Tien, the main imperial palace. On Oct. 13, the Chinese army took over the garrison of the city. Peiping then resumed its former status as a municipality under the central government. It also became a key political centre in North China, especially with regard to the conflict of the Chinese government with the Communists.

Pennsylvania

A middle Atlantic state, Pennsylvania is one of the original 13 states of the union, popularly known as the "Keystone state." Area, 45,333 sq.mi., including 288 sq.mi. of inland water. Population (1940) 9,900,180, of whom 8,453,729 were native-born white, 973,260 foreign-born white and 470,172 Negroes. The urban population in 1940 numbered 6,586,877 and the rural 3,313,303. Capital, Harrisburg (83,893); other cities: Philadelphia (1,931,334); Pittsburgh (671,659); Allentown (96,904); Wilkes-Barre (86,236). On July 1, 1944, the bureau of census estimated the state's population at 9,247,088.

The first Pennsylvania legislature to be controlled by Democrats in over 90 years met early in 1937, and presented the governor with 137 bills, of which 17 were vetoed. Those approved featured labour legislation, in-

cluding measures providing for a 44-hour week; establishing a labour relations board; limiting the use of injunctions in labour disputes; upholding the right of organization; and providing for minimum wages for women and minors. These statutes were intended to prevent repetition of the serious situation resulting from strikes during the year. Other labour provisions included bills requiring full railroad crews and regulating industrial work in homes.

The most perplexing problem faced by the legislators in 1937 was the bootlegging of coal from abandoned mines, which had reached such proportions that federal intervention seemed imminent. A state commission was established to study the problem, but at year's end the proper solution was still debated. Other significant measures in 1937 included a bill reorganizing relief administration by abolishing local poor boards and establishing a board of public assistance to operate through two city and 66 county districts; provision for a toll highway between Harrisburg and Pittsburgh; an act granting the state wide powers of liquor control. Of five constitutional amendments submitted to the voters in Nov. 1937, only the one legalizing pensions to mothers and to the blind was approved. The electorate refused to uphold a state income and inheritance tax and rejected consolidation of the Philadelphia city and county governments, although even the Republican city chairman supported the administration's proposal.

In the November election of 1938, the Republicans carried the state. Judge Arthur H. James of the superior court received more than 2,000,000 votes for governor, defeating his Democratic opponent by 300,000 votes. His associates on the ticket were also elected, including James J. Davis, a candidate to succeed himself as U.S. senator. The Democrats had controlled the general assembly with a majority of 100 in the house and 18 in the senate. This was changed to a Republican majority of 50 in the house. The Democrats still had a majority of two in the senate, but later a holdover independent Democrat announced that he would vote Republican, thus creating potential tie votes in the senate. Marion D. Patterson was elected justice of the supreme court. William H. Keller, presiding judge of the superior court, and associate judges Thomas J. Baldrige and William E. Hirt, were re-elected. All were Republicans.

During a special session of the general assembly, which began on July 25, 1938, and continued until Nov. 30, 38 bills were passed including one transferring to state control the hospitals for mental diseases in 12 counties, another for the expenditure by the state authority of \$93,000,000 for school buildings and a third making the state responsible for the medical care of those on relief. It appropriated \$25,000,000 for general relief and \$3,474,925 for other purposes.

The general assembly created a department of commerce in 1939, and Richard P. Brown was appointed as its first head. A new law of 1939 directed that aliens more than 18 years old should register annually with the department of labour and industry and should carry registration cards to be shown on demand of the police. The validity of the law was contested in the U.S. courts on the ground that the subject was outside the jurisdiction of a state and late in Nov. 1939, the federal district court declared the act invalid for this reason. Among acts dealing with labour was one which empowered the courts to issue injunctions against sit-down strikers and provided that employers as well as employees might petition the Labor Relations board for redress of grievances. The right to reinstatement

or to payment of wages during strike periods was denied to workers found guilty of unfair practices; engaging in a sit-down strike was defined as an unfair practice. The anti-injunction law was further amended to permit the issue of a restraining order when there was violation of a valid agreement or when employees engaged in practices intended to coerce an employer. The act of a previous legislature intended to prevent a grand jury investigation of charges against executive officers of the state was repealed. The investigation which this law was intended to stop was continued and several officials were indicted.

The validity of the graduated chain stores tax, levied by a previous legislature, was contested in court by the companies involved. The tax varied from \$100 to \$500 on each store. When the case reached the supreme court it was held that the law violated the provision of the state constitution which directed that taxes should be uniform on the same class of property.

In the 1940 presidential election, on Nov. 5, the Democrats carried the state, giving President Roosevelt the state's 36 electoral votes. Roosevelt received 2,171,035 votes and Willkie 1,889,848. Joseph F. Guffey was re-elected to the U.S. senate, and 19 Democrats were elected to the national house of representatives. The Republicans elected 15. The Democrats elected G. Harold Wagner as state treasurer and F. Clair Ross as auditor general. The Republicans retained control of the state senate with 32 members to 18 Democrats, but the latter elected 126 members of the house to 82 by the Republicans. The question whether motion picture theatres should be operated on Sunday was submitted to the voters, and 87 communities voted against Sunday opening; 47 in which the theatres had been closed voted to permit their operation.

The general assembly met in special session on May 6, 1940, primarily to appropriate \$71,850,000 for unemployment relief. Among other measures approved were one authorizing the extension of the Harrisburg-Pittsburgh superhighway from Carlisle to Philadelphia; another appropriating \$1,000,000 for relief of distressed school districts; an increase from 16 to 18 years in the age limit of those eligible for aid as dependent children; an amendment to the election code permitting a special election for filling vacancies in the general assembly during a recess, and one exempting employers from payment of insurance taxes on salaries over \$3,000. The state supreme court decided that the Fair Sales act of 1937 was invalid as its second section, which forbade sale of merchandise at less than cost, violated the 14th amendment of the U.S. constitution. In January the governor appointed a committee to solve the problems of the mining industry. It agreed on a voluntary stabilizing program, allocating the amount of anthracite to be mined from week to week.

The biennial session of the general assembly met in Jan. 1941. One of the first acts provided for a state defense council. Under authority of the act the organization of a home defense guard of 5,000 was ordered. A state housing board was also created. The state was authorized to cooperate with other states in the regulation of oil production. Retail and wholesale merchants were forbidden to sell goods at less than cost with a few exceptions. Re-employment of state employees called into military service was guaranteed with half pay up to \$2,000 a year while in service. Public employment and participation in elections was forbidden to all who aimed at the overthrow of the state or federal government by force. A civil service board was created in the departments of public assistance, unem-

ployment compensation and liquor control. Under the congressional reapportionment act, the state's representation was reduced from 34 to 33. The validity of the state labour law recognizing the right of workers to organize and bargain collectively was sustained by the state supreme court.

In the Nov. 1941 election, the Republicans elected their candidates to the supreme and superior courts. They also elected 36 county judges to 9 elected by the Democrats, and 10 mayors as against 9 by Democrats. The Republicans were also victorious in the special election in the 15th congressional district.

In a special session in Feb. 1942, the general assembly passed a bill abolishing two congressional districts and providing for the election of two representatives-at-large on a state-wide ticket. In November the Republicans elected Edward Martin as governor, John C. Bell, Jr., as lieutenant governor and William S. Livengood as secretary of internal affairs; also a justice of the supreme court and a judge of the superior court. They also retained control of the senate and regained control of the house, which they had lost in 1940, and elected 19 of the 33 members of the national house of representatives including the representatives-at-large. The principal state officers in 1942 were: Arthur H. James, governor; Samuel S. Lewis, lieutenant governor; Claude T. Reno, attorney general; G. Harold Wagner, treasurer; and William I. Schaffer, chief justice.

The 1943 biennial session of the general assembly began on Jan. 5 and continued until May 9, passing many important bills. It reduced taxation by \$45,000,000 in spite of increased appropriations for welfare and education and appropriations to the police pension fund. It suspended the operation of civil service regulations in state departments for the duration of the war, transferred 400 jobs from the Democratic-controlled attorney general's office to the Republican secretary of revenue, permitted the employment of school children 14 years old on farms in case of a shortage of labour, authorized the state council of defense to aid in the elimination of black markets, made an estimated reduction of \$3,000,000 in automobile licence fees, empowered the governor to suspend laws when the legislature was not in session on the request of the federal government, created a postwar planning commission and increased from 44 to 48 hours a week the permissible time for the employment of women and children in war industries. Principal officers in 1943 were: Edward Martin, governor; James H. Duff, attorney general; G. Harold Wagner, treasurer; George W. Maxey, chief justice.

(G. W. Do.; X.)

A special session of the assembly met on May 1, 1944, to amend the military ballot law. In the shortest session on record (five days), the most liberal soldier vote legislation in the country was passed, requiring that a ballot be sent to every qualified voter, even if not registered, who was serving in the armed forces, Red Cross, or similar organizations. In the general election, 255,226 military ballots were cast. Franklin D. Roosevelt carried the state in the general election by 1,940,479 votes to Thomas E. Dewey's 1,835,048. The Republicans, however, retained control of the general assembly, holding the senate by 32-18 and the house by 109-99. Principal officers in 1944 included: Edward Martin, governor; John C. Bell, lieutenant governor; James H. Duff, attorney general; William S. Livengood, Jr., secretary of internal affairs; F. Clair Ross, auditor general; G. Harold Wagner, treasurer; George W. Maxey, chief justice; Francis D. Haas, superintendent of public instruction.

Among the achievements of the state government in

1945 was the passage of various acts implementing the conservation of the state's resources and the development of a postwar program of public works. Appropriations were granted for the development and protection of the water, mineral, soil and forest resources of the state and for the improvement of state parks. An extensive program of highway and institutional construction was also authorized. Appropriations were made for the preparation of plans for local public works and for planning and construction of airports. The legislature granted public school teachers a permanent increase in pay, making the state's salary schedule the highest of any state and set up a new system of physical examinations for school children. Unemployment compensation benefits were liberalized, while contributions for compensation were reduced for those whose employment records were stable.

By 1945, nearly 1,200,000 Pennsylvanians had seen military service, almost one-eighth of the total population. Estimated casualties of World War II from the state were 80,000, including 20,000 killed. During the war period, the state produced more than 31% of the nation's coal, coke and steel requirements; it stood seventh in over-all war production, sixth in communication equipment, fourth in shipbuilding, third in ordnance and first in expansion of industrial facilities. The civilian defense corps organized April 23, 1941, which at one time included

1,600,000 citizens, was demobilized Oct. 15. New officers in the posts of auditor general and treasurer of the state were G. Harold Wagner and Ramsey S. Black.

The election of Nov. 1946 gave the Republicans a clean sweep by the largest majorities in 20 years. Gov. Martin captured the seat in the U.S. senate held by Joseph F. Guffey.

James H. Duff, attorney general, was elected governor, while Brig. Gen. Daniel Strickler was chosen lieutenant gov., and William S. Livengood, Jr., was named to his third term as secretary of internal affairs. The Republicans elected 28 of the state's 33 congressmen, gaining nine seats

Pensions, Army and Navy (U.S.)*See VETERANS' ADMINISTRATION.***Pensions, War (British and European)**

The present article deals with war pensions in Great Britain, several of the principal European countries and the British Commonwealth. For such pensions in the United States *see VETERANS' ADMINISTRATION.*

Great Britain.—The ministry of pensions was set up by act of parliament in 1917 and made responsible for the administration of war pensions and the provision of treatment for disablement resulting from war service. During the immediately succeeding years many changes and improvements were made in the war pensions code but thereafter the position was, in the main, stabilized until the outbreak of World War II.

In Sept. 1939 the ministry of pensions became responsible for the award of compensation to members of the armed forces, to merchant seamen and to the civil population generally for disablement or death suffered in the new war. The initial provisions for members of armed forces followed broadly those of World War I, and compensation remained dependent on the requirement of causal connection between disablement or death and war service. The rates were about 75% of those fixed in 1919, reflecting the fall in the cost of living. A scheme was introduced to cover the death or disablement of officers and men of the merchant navy and fishing fleets through war injuries resulting from enemy action while on sea-going service.

In 1942 the scheme was widened to cover certain other injuries at sea resulting from substantially increased risks arising from war conditions; *e.g.*, sailing in convoy, the absence of navigational aids and warnings or the carriage of unsuitable cargo. The rates of compensation took account of rank and corresponded to those paid to the royal navy. Other schemes provided compensation for disablement or death through war causes of Indian and Chinese seamen on British ships. Provision was made for the payment of compensation for civilians disabled or killed as a result of injuries caused by enemy attack or sustained in the course of their duties as members of civil defense organizations. The rates of pensions laid down were broadly those for private soldiers.

On the outbreak of World War II the pension rates for women were about two-thirds of those for men. In 1941 a select committee of the house of commons recommended that this differentiation be abandoned. Thereafter men and women covered by the civilians' scheme received the same rates of pensions, and this provision was extended to the basic ranks in the armed forces. In 1943 important changes were introduced. World War II pension rates, already increased from time to time, were brought up to those fixed in 1919. The pension instruments were amended to make it clear that the onus of proving connection between disablement or death and war service did not rest with the applicant, who was entitled to certain presumptions in his favour, and that the benefit of any reasonable doubt should be given to him. A special allowance was introduced for pensioners of both wars so seriously disabled as to be virtually unemployable, with allowances for wives and children even though not otherwise eligible because marriage had taken place after disablement. An allowance was also introduced to supplement the pensions of widows with children where a rent of more than 8s. (*c.* \$1.60) weekly was paid. In the same

year the Pensions Appeal Tribunals act was passed. This provided for the setting up of independent tribunals to hear appeals against adverse entitlement decisions of the ministry and against the ministry's assessment of the extent of disablement. The hearing of entitlement appeals began late in 1943 and of assessment appeals at the end of 1946.

Further improvements were announced in 1945 and 1946, the most important being the abandonment of the principle which had previously precluded payment generally of allowances in respect of a wife and family, or pension to a widow, unless marriage took place before the disablement was sustained. The rates of disablement pension, the allowance for the unemployable pensioner and the widow's maximum rent allowance were all increased. A new special hardship allowance was introduced for the partially disabled pensioner of World War II who, though not unemployable, was prevented by his disablement from following his old occupation or one of equivalent standard.

The more important rates of pension and allowances applying to both wars are shown below.

Disablement.—This was assessed by comparison with a normal healthy person of the same age and without regard to earnings: private soldier (100% disablement) £2 5s.; allowance for wife 10s.; allowance for each child 7s.6d. Awards for lesser degrees of disablement in steps of 10% down to 20% were proportionate. Disablement below 20% was compensated by a lump sum payable either outright or in instalments. Where disablement was so severe as to prevent restoration of any working capacity an "unemployable" supplement of £1 weekly was paid and the allowance for a dependent wife was increased to 16s. A pensioner disabled 100% who needed constant attendance could have an additional allowance of from 10s. to £2 weekly. Thus, in a case of very severe disablement a married private soldier with 2 children could receive £6 16s. weekly. Disablement pensions and allowances were not subject to income tax.

Death.—Widow of private soldier: if more than 40, or in receipt of an allowance for a child or infirm £1 15s.; allowance for each child 11s.; rent allowance up to 15s.; if less than 40 and childless and not infirm £1; motherless child less than 15, 13s.6d.; motherless child of 15 or more £1; motherless child of 18 or more and an invalid £1 6s.

Parents.—Pensions were based on need and on the expectation of the support the deceased would have given had he survived. In the case of officers the maximum weekly rates of pension were £1 16s.6d. and £2 6s. for one and two parents respectively. The corresponding rates for other ranks were £1 7s.6d. and £2.

Disablement and widows' pensions varied according to rank. The 100% disablement rate for a junior officer was £4 1s. weekly, wife's allowance 14s. and child's allowance 11s.6d. Rates for officers' widows more than 40, or in receipt of an allowance for a child or infirm were from £2 18s. weekly with 14s. for each child but no rent allowance. Allowances for children normally ceased at 16. They could be extended beyond that age, *e.g.*, where the child was a student or an invalid. In addition, an allowance could be given under certain conditions for the education of a child of a disabled or deceased person. The maximum for each child was £1 10s. a week.

By March 31, 1946, £1,750,000 had been spent on pensions in respect of World War I. At that date the annual expenditure amounted to £40,000,000. For World War II the comparable figures at the same date were £90,000,000

and £35,000,000. On June 30, 1946, there were still about 586,000 pensioners from World War I and the numbers for World War II had reached 476,000, a total which would have increased over the next year or so.

The special arrangements for World War II included the organization by the ministry of health of an extensive emergency hospital service and of special centres for the treatment of certain disabilities, including neuroses, peripheral nerve injuries and chest, spinal and head injuries. Much attention was paid to orthopaedic surgery and to rehabilitation, in which occupational and remedial therapy played an important part.

The ministry of pensions had under direct control, in 1946, 12 hospitals and a number of out-patient clinics and also had arrangements with hospitals throughout the country for the treatment of the war disabled at the expense of the ministry. An important side of the ministry's work was the provision of artificial limbs and training in their use, and for this purpose 17 limb-fitting centres were maintained. Arrangements had also been made for the supply of surgical appliances and of hand and motor-propelled chairs. Artificial eyes were manufactured at the ministry's optical appliances depot, a feature being the development of plastic artificial eyes. The depot also supplied spectacles where required as the result of war disablement. Under ministry auspices considerable advances had been made, and research continued, in the design and construction of artificial limbs, in plastic surgery for facial and jaw injuries and in the treatment of serious spinal injuries. The ministry also co-operated closely with the ministry of labour and national service to ensure that the war disabled who could not resume their old occupations, but who were not incapable of work, were given suitable training and placed in employment. (W. Pc.)

Australia.—Under the provisions of the Australian Soldiers Repatriation act of 1920-46, the Australian government paid war pensions in cases of incapacity and death arising from service with the Australian forces during either World War I or World War II. The minimum basic rate was £A5 a fortnight, and the maximum £A6 16s. a fortnight. In addition there were special provisions for blinded servicemen and those with amputated limbs or, in some other way, totally incapacitated for life; these received a pension of £A9 12s. a fortnight and an assistance allowance of £A2 8s. a fortnight. The commonwealth also provided free medical treatment for war disabilities and surgical and hearing aids. The headquarters of the repatriation committee was established in Melbourne, with a branch in each state, in charge of a deputy committee of repatriation. At the end of June 1945 there were 281,079 pensioners receiving a total of £A11,728,864 a year in war pensions.

Canada.—Under the provisions of the Pensions act of 1927 as amended by later statutes up to 1946, war pensions were assessed and awarded by a Canadian Pension committee appointed by the governor-general in council. Disabilities were reckoned in terms of a percentage. The pension for a 100% disability for a single man below the rank of army captain or the equivalent was \$75 (Canadian) a month; these were scaled down per percentage. Pensions were paid at higher rates for the various ranks above captain. In addition, the usual allowances were made for wives and children. Canadian legislation anticipated that of other countries in making provision for wives who were married after the disability had been incurred. The pensioner was entitled to free medical treatment, artificial limbs and surgical appliances. Widows or nearest depend-

ent relatives of servicemen below the rank of army captain killed in active service received a maximum pension of \$60 a month; this was scaled down according to the amount of income from other sources. Higher rates were paid to widows and dependents of those above the rank of captain. In 1945 the annual cost to the government of pensions was \$37,140,669 arising from World War I and \$13,418,179 arising from World War II.

New Zealand.—In New Zealand, war pensions were regulated by the War Pensions act of 1943, which repealed all previous legislation and had subsequent amendments and by the War Pensions and Allowances (Mercantile Marine) act of 1940 (amended in 1943). They were awarded by a war pensions board. A totally disabled man was entitled to a pension of £NZ3 a week; in addition, he could claim allowances of £1 a week for a wife and 10s. for each child less than 16 years of age. The widow's pension was £2 a week with an allowance of £1 10s. a week for the first child and 10s. a week for each additional child. An "economic pension" (*i.e.*, a supplementary allowance to a totally disabled pensioner whose circumstances necessitated additional financial assistance) might also be granted. Servicemen received free medical care and hospital treatment. While in a hospital, they drew their pensions at the full disability rates. Men wearing artificial limbs or appliances might be granted a clothing allowance of up to £14 a year. An attendant's allowance of up to £5 a week might be given in cases where the services of an attendant were essential. In 1946, 54,219 war pensions were in force in New Zealand, of which 29,758 arose from World War II. The annual value of these was £4,200,000. New Zealand pensions were paid in any part of the world.

South Africa.—Under the South African Military Pensions acts of 1919 and 1942, as amended in 1946, pensions for volunteers wounded in World War II were assessed by a military pensions board. Disablements were reckoned in percentages; the pension for 100% disablement was £200 a year and pro rata down to 20%, when a gratuity was paid as a lump sum. The claimant in addition received allowances for a wife, boys up to 18 years of age, girls up to 21 and dependent relations; by later legislation, unmarried "wives" and illegitimate children could benefit from these. A pensioner was entitled to free treatment for his disablement and, if an in-patient, received a 100% allowance. Pensioners of 80% assessment or more might receive an attendant's allowance if considered necessary. Awards for female volunteers (except doctors) were slightly lower than those for men; however, they might claim additional allowances for disabilities which might hinder their chances of marriage. Widows of servicemen received a gratuity and a pension with allowances for dependent children; on remarriage the pension stopped, and a gratuity of £132 was paid down. (X.)

France.—In France the basic charter of military victims of World War II was the act of March 31, 1919. The text governing civilian war victims was the act of June 24, 1919, supplemented by that of May 20, 1946. The act of March 31, 1919, was based on a new conception of the "war victim." While former legislation considered disabilities only from the angle of the victim's fitness for further service with the armed forces, the new texts attempted to ensure reparation, as far as possible, for all physical injury resulting from the war, whether it affected the invalids themselves or their legal dependents (widows, orphans, parents). The principle was therefore one of

reparations, not of *ex gratis* state assistance. Henceforward, the war victim had legal rights. A second principle of French legislation in this field was the "objective" character of the reparation provided. It considered invalidity as such without regard to the special prejudice suffered by the victim by virtue of his occupation or profession.

Any invalidity was pensionable provided that it diminished the victim's validity by at least 10%. A medical board at which the pensioner might be assisted by a doctor of his choice assessed the degree of disability according to an invalidity table graded from 5% up to 100%.

A pension was permanent when the injury involved was incurable. Otherwise, the pension was temporary and became permanent only after three years in the case of injuries and nine years in the case of diseases. Pensions were revisable should the pensioner's condition deteriorate. A supplementary pension was granted to invalids suffering from several infirmities of which one only entailed total incapacity. Invalids not able to walk or live unaided were entitled to outside help and benefit by a supplementary pension. The highest invalidity brackets (from 85% upward) were entitled to supplementary indemnities whose rates varied with the nature and importance of the disability. Another indemnity was granted to severely maimed war victims (*grands mutilés*) who held the special card issued to those who had served at least six months' service at the front (*carte du combattant*). These indemnities were cumulative. The amount of the pension, at least for its basic rate, depended on the pensioner's military rank. Supplements were payable in respect of pensioners' children. In France no sliding scale for pensions was in force. From time to time pension rates were adjusted by law to keep them in line with the cost of living; the last revision of this kind in the decade 1937-46 was that of Aug. 10, 1946. Such increases as took place were uniformly based on the rate applicable to the private soldier. Pensioners were entitled to the payment of their medical and, as the case might be, their hospital expenses. If need be, the state assumed the cost of their professional re-education.

Although in matters of pensions the onus of proof, as in civil law, fell on the claimant, the legal texts, in certain cases, granted the claimant the benefit of what was called "presumption of origin." In such cases it was presumed that invalidity was the result of war service and the onus of disproof lay on the state. This applied to injuries or accidents suffered during war service. As regards diseases of which the origin was more difficult to detect, the "presumption of origin" applied only after a minimum period of service and ceased to apply after a given time following demobilization.

War widows benefited by pensions provided that they were married for a minimum period (two years). If the husband died from war injuries or the effects of a disease attributable to war service, the widow was entitled to a pension at what was called the "normal rate." That rate corresponded in principle to one-half the pension payable to a private soldier in respect of a 100% invalidity. If the death resulted from a disease or an accident unconnected with war service, the texts, allowing for the reduced physical resistance of former servicemen, entitled widows to a "reversionary" pension provided the husband's invalidity was assessed at a minimum of 60%. The reversionary pension was equal to two-thirds of the normal pension. If the pensioner left no widow or if she had remarried, his orphaned children enjoyed the same rights

in her place. Finally, the pensioner's parents might equally claim a pension; but their title, under the law, depended on their age and on a means test, the latter being provided by the income for which they were assessed under general income tax.

The act of March 31, 1919, set up special jurisdiction for contested claims. At its basis was a pension tribunal in each of France's 90 *départements*, presided over by a career judge and including a medical officer and a pensioner designated by one or other of the disabled servicemen's associations. Appeals from this tribunal went to a regional pensions tribunal, of which there was 1 for each of the 26 appeal court districts. The regional tribunal was exclusively composed of career judges. The whole appeal procedure was free of legal expense. In the last resort a special pensions commission attached to the *Conseil d'Etat*, France's highest administrative court, could be appealed to, but only as a court of cassation that adjudged on the legality of the decisions of the lower courts. Decisions held illegal returned to the lower courts for revision and re-judgment.

During the 1937-46 period these statutes were modified in details but not in principles. Among the modifications was the extension of time limits originally provided for the submission of pension claims so as to protect claimants whose infirmities revealed themselves belatedly. Another law provided remedies for the abusive grant of pensions and allowed for a revision of those granted to noncombatants. To avoid malpractices, a law, at the beginning of World War II, defined the conditions under which mobilized soldiers, in case of illness, could invoke "presumption of origin" for their claims. In 1941 the Vichy government further reduced the scope of this legal presumption. It also abolished, with effect for the future, the pension rights of remarried widows, their rights being vested in their children under age. Widows who remarried before this change in the law retained their pension.

After the liberation of France, a number of decrees made war pensions legislation applicable to two more categories of beneficiaries: first, the members of the French forces of the interior who fought in military formations; second, the members of the resistance movement who, while not belonging to regular military units, voluntarily participated in the defense of their country. Prisoners of war had already previously benefited by the act of March 31, 1919, being members of the armed forces.

The act of June 24, 1919, on civilian war victims, was no more than a specific and somewhat restricted variation of the act of March 31, 1919. It granted pension rights to civilians injured in the course of military operations, these terms understood *lato sensu*, as well as to victims of acts of violence committed by the enemy. The act of June 24, 1919, did not admit of the "presumption of origin." Moreover, it applied only to diseases contracted (*versus* aggravated) as a result of war, while in the case of soldiers aggravation was also considered.

A modification of this act became necessary in view of the way in which hostilities were conducted from 1939 to 1945 and the unexpectedly great number of civilian war victims. That was done by the act of May 20, 1946. It extended pension benefits to the victims of deportation and, more generally, of German atrocities.

Belgium.—Belgian legislation was very similar to the French. It included, however, one by no means negligible benefit for the pensioner, unprovided for under the French legislation, viz., a sliding scale adjusted to the cost of living index. If the cost-of-living rose, pensions were increased simultaneously and automatically without a spe-

cial law having to be passed for that purpose.

Netherlands.—Dutch pension legislation distinguished between career soldiers and drafted soldiers of the reserve. For the first group, the basic rate of invalidity pension was made equal to the maximum of their retirement pension: i.e., 70% of their active service pay. To obtain the amount of the invalidity pension the basic rate thus determined was multiplied by the percentage of disability. For soldiers of the reserve, the pension was calculated in such a way as to produce, in conjunction with the invalid's earnings, the amount of normal income corresponding to his occupation. In the case of widows and orphans, the same distinction applied as above. The widow of a regular soldier received half the amount of her husband's last service pay. For each child a further 10% was paid. In the case of a soldier of the reserve, the basic rate of the widow's pension depended on the lowest pay corresponding to the soldier's service rank. If that pay was lower than his earnings in civilian life, which was frequently the case, she received a supplementary allowance. In 1946 new measures were under consideration which would base the widow's pension not on the past actual earnings of the deceased, but on what those earnings would be at current rates.

The pension rights of parents were confined to the amount of support which the deceased son might have provided them in his lifetime.

In 1946 the extension of pension legislation to the survivors and dependents of members of the resistance movement was in preparation.

As in the Belgian case, increases in pensions were being made from time to time to adjust them to the rise in the cost of living.

U.S.S.R.—At the beginning of World War II the U.S.S.R. took measures to introduce war pensions legislation. Under the soviet system invalids were grouped into three categories: the totally disabled requiring outside help; the totally disabled not in need of outside help; the partially disabled. The peculiar feature of the soviet system lay in the assessment of disability, which considered two factors: disability as such, and the invalid's occupation. Similarly, the amount of the pension was the combined result of the degree of invalidity and the former earnings of the invalid concerned.

As in France, the pension right was not subject to any means test, but its amount was reduced by 20% in the case of rural pensioners whose income was drawn from an agricultural occupation.

Similar legislation existed or in 1946 was being evolved in Poland, Czechoslovakia, Yugoslavia and Greece; but its latest developments had not yet taken final legislative shape.

Perkins, Milo Randolph

Perkins (1900–), U.S. government official, was born Jan. 28, 1900, in Milwaukee, Wis. A salesman and part owner of a burlap bag business, he became in 1935 assistant secretary in the department of agriculture. Two years later he was named assistant director of the Farm Security administration, and in Jan. 1939 he was transferred to the Agricultural Adjustment administration as associate administrator and was also named president of the Federal Surplus Commodities corporation. He originated the food stamp plan under which surplus foods were distributed free to the needy, and he established on a nation-wide scale the school lunch plan and low-price milk distribution. In 1941 he was appointed executive head of the Economic Defense board, retaining that post when this agency was reorganized as the Board of Economic Warfare on Dec. 17, 1941. In Nov. 1941 he was selected head of the U.S. section of the Canadian-U.S. Joint War Production committee and in April 1942 he was given control of the government program to acquire critical war materials.

In July 1943 President Roosevelt dissolved the BEW after Vice-President Henry A. Wallace aired publicly his quarrel with Jesse Jones, and transferred its functions to the Office of Economic Stabilization headed by Leo T. Crowley. Crowley announced that Perkins would not be retained in the new agency. Perkins subsequently retired from government service.

Permanent Court of International Justice

During the final ten years (1937–46) of its life, more than half of which were marked by forced inactivity as a result of World War II, the Permanent Court of International Justice dealt with eight cases, as follows:

Diversion of Water from the Meuse.—The Netherlands complained that certain works constructed by Belgium, or in contemplation, in connection with the Albert canal infringed a treaty of 1863. Belgium filed a counterclaim questioning whether or not the construction by the Netherlands of the Juliana canal and Borgharen barrage was compatible with the treaty. The court, after visiting the locality in 1937 dismissed both complaints.

Lighthouses in Crete and Samos.—France and Greece submitted a question whether or not an agreement of 1913 between a French firm and the Ottoman government extending the life of certain concession contracts relating to lighthouses was duly entered into and operative against Greece as regards lighthouses in Crete and Samos, territories assigned to Greece after the Balkan wars. The court in 1937 decided both questions in the affirmative.

Borchgrave Case.—Belgium and Spain submitted the question whether or not responsibility attached to Spain for the mysterious death, in Spain in 1936, of Baron Jacques de Borchgrave, a Belgian national. Belgium also charged lack of diligence in apprehending and punishing the guilty. The case was discontinued in 1938 at the request of the parties.

Phosphates in Morocco.—Italy instituted proceedings against France, charging that Italian nationals had been deprived of rights in phosphate deposits in Morocco contrary to treaty provisions. France questioned the jurisdiction of the court on the ground, *inter alia*, that the case arose before its declaration accepting compulsory jurisdiction and was outside that declaration. The court so held in 1938 and declined to take jurisdiction.

The Panevezys-Saldutiskis Railway Case.—Estonia charged Lithuania with refusal to recognize rights of an Estonian company in railway properties in Lithuania. Lithuania raised two preliminary objections relating, respectively, to the nationality of claims and the exhaustion of local remedies. The court decided to join the objections to the merits and consider them together. In 1939 it held the latter objection well founded and declined to entertain the claim.

The Electricity Company of Sofia and Bulgaria.—Belgium asked the court to declare that Bulgaria had failed in its international obligations toward the Electricity company of Sofia, a Belgian national. Bulgaria denied the jurisdiction of the court. The court upheld its jurisdiction and fixed the time for filing further documents; later, it indicated that pending final judgment Bulgaria should take no action prejudicial to the company. In Feb. 1940 it fixed May 16 for the opening of oral proceedings. These never took place. In Oct. 1945 the case was discontinued at the request of Belgium.

The "Société Commerciale de Belgique."—Belgium brought an action against Greece charging that the latter had refused to comply with arbitral awards in favour of the Belgian company.

The court in 1939 declared the awards definitive and obligatory.

Girliczy Case—Liechtenstein v. Hungary.—Liechtenstein charged that its national had been required to make cash settlements in Hungary contrary to a convention of 1924 between Hungary and Rumania relating to revalorization of debts and claims. Hungary appointed an agent and in Oct. 1939 the president of the court fixed the time for presentation of written pleadings. No further step was taken.

The court held its final meeting at The Hague, Oct. 26–31, 1945. It was formally dissolved by the assembly of the League of Nations at Geneva as of April 19, 1946, the International Court of Justice established by the United Nations, having meanwhile begun functioning. (See also INTERNATIONAL COURT OF JUSTICE.) (G. H. H.)

Perón, Juan Domingo

Perón (1895–), Argentine army officer and statesman, was born Oct. 8, 1895, near Lobos, a small town south of Buenos Aires, and was educated in military schools, becoming a full lieutenant in the army by the time he was 20 years old. He became one of the leaders of the G.O.U. (Grupos de Oficiales Unidos) a nationalist clique of young army officers with totalitarian leanings, and played an important role in the coup d'état that overthrew the Castillo regime on June 4, 1943. In succeeding governments, Perón was the power behind the throne, although he held only minor official posts. In 1944, when Gen. Farrell became president, Perón was made war minister and vice

president. The strong totalitarian trend of the government and its refusal to eliminate "axis" influences were sharply criticized by Secretary of State Hull and President Roosevelt in 1944. Perón exploited these criticisms as evidence of U.S. "dollar diplomacy"—and refused to alter his policy.

In 1945, Perón was ousted in a short-lived military coup staged Oct. 9, but in less than two weeks was back in the saddle, with more authority than before. He was elected president in the elections, held Feb. 24, 1946, and was inaugurated the following June 4.

Wavering U.S. policy toward Argentina enabled Perón to entrench himself. While he was denounced in the state department Blue Book (Feb. 12, 1946), department officials subsequently declared that it would be "silly" for the U.S. to break with Argentina because France and Britain would not follow suit. He capitalized on Argentina's excellent situation with regard to food exports by notifying U.N.R.R.A. that Argentina would ship 50,000 tons of grain to Europe in June and promised further aid in July. However, on Aug. 15, 1946, he said Argentina would ship food only to those countries which could supply Argentina with manufactured goods. After ratification by the Argentine congress of the Act of Chapultepec and the U.N. charter, Perón declared that the era of Argentine "misunderstandings" with the Western Hemisphere nations was closed.

Peru

A republic on the west coast of South America, Peru extends into the Amazon basin, bounded by Ecuador and Colombia on the north, Brazil and Bolivia on the east, Chile on the south, and the Pacific on the west. Area, 482,133 sq.mi.; pop. (1940 census), 7,023,111; this total was based on the number of persons enumerated (6,207,967) plus the calculated number of unenumerated persons (465,144) plus the estimated number of persons living in the jungles of eastern Peru (350,000). An official est. of pop. in 1944 was 7,522,684. The census of 1940 revealed a population density for the entire country of 14.56 per sq.mi., ranging from 0.43 per sq.mi. in the department of Madre de Dios to 56.42 per sq.mi. in that of Lima, although the constitutional province of Callao (14 sq.mi.) had a density of 6,031.29 per sq.mi. The population was estimated as 52.9% white and mestizo and 45.9% Indian, but more than 51% normally speak Indian languages. Peru contains the second largest number (Brazil is first) of Japanese in any Latin American country, an estimated 23,000; the number of Chinese was estimated at 17,000 and the Negroes at 29,000. The capital is Lima (pop., 1940 census, 533,645; 1945 est., 628,821); other important urban centres (with pop. by 1940 census; if a second fig. is given it is that of a 1945 est.) are Callao (84,438); Arequipa (79,185); Cusco (45,158; 45,230); Trujillo (38,961; 41,589); Iquitos (34,231); Chiclayo (32,646); Huanacayo (28,679); Sullana (22,344); Ica (21,437); and Piura (20,093; 29,674).

The constitution of 1933 (amended in 1936 and 1938) established a unitary government with 22 territorial departments, an executive branch headed by a president and two vice-presidents, all chosen by direct, popular election for six-year terms and ineligible for re-election until after an intervening term, a bicameral congress including a senate of 54 members elected by departments and a chamber of deputies of 156 members, both elected for six-year terms, and a judiciary headed by a supreme court of 16 members elected by the congress. Presidents during the decade 1937–

46 included Marshal Óscar Raimundo Benavides, 1933 to Dec. 8, 1939; Manuel Prado y Ugarteche, Dec. 8, 1939 to July 28, 1945; José Luis Bustamante y Rivero, after the latter date.

Prewar Politics.—The chief disturbing factor in Peruvian affairs at the outset of the decade in 1937 was the continued agitation by members of the outlawed Apra (*Alianza Popular Revolucionaria Americana*). This group, under the leadership of the internationally known Víctor Raúl Haya de la Torre, had been active in Peruvian politics for some seven or eight years prior to 1937. As the presidential candidate of the Apristas in 1931, Haya de la Torre was allegedly chosen president but was kept from the office by fraudulent counting of the votes. Gen. Oscar Benavides had come into the presidency following the assassination of Pres. Luis Sánchez Cerro in 1933. New elections were set for 1936, but when the Aprista-supported candidate (the party itself had been proscribed in the meantime) appeared to be winning, the congress voided the elections, granted Pres. Benavides dictatorial powers and dissolved itself. That situation prevailed at the beginning of 1937, but Apristas, embittered by the results of the 1936 elections, continued undercover political opposition; this resulted in disorders and many arrests. Economic conditions continued their steady improvement characteristic from 1932, the betterment being chiefly the result of increased production of gold and cotton.

Peruvian development in 1938 was marked by general quiet, except for an unsuccessful rebellion in October. The government began work in Jan. 1938 on the construction of a new port at Matarani on the southern coast to replace Mollendo as a Pacific rail terminus. Improvements at Callao, the port of Lima a few mi. inland, were completed in July, making that port one of the best equipped on the west coast of South America; the improvements included a new graving dock. Peru was host to the eighth Pan-American conference at Lima in Dec. 1938; the conference assumed unusual importance in view of the gathering war clouds in Europe and the conference at Munich.

A change in administration, if not an immediate reorientation of domestic political policy, occurred in 1939. Retirement of Gen. Benavides as president-dictator was forecast as early as February, when his minister of the interior and police, Gen. Antonio Rodríguez, was killed in an abortive attempt to seize the presidency. Gen. Benavides decided, however, to retire voluntarily from the presidency; he first brought about a plebiscite which gave the executive greatly increased powers. His followers asserted that his administration had been one of the most constructive in Peru in many years, and pointed as evidence to modern urban workingmen's homes and model villages, a compulsory social insurance project, and an ambitious highway program; opponents charged him with ruling with oppressive methods, driving the political opposition into hiding or exile or throwing its members into jail and stifling democracy and free speech. Pres. Benavides' hand-picked candidate, Dr. Manuel Prado, son of an earlier Peruvian president, won easily in the elections in Oct. 1939 and was inaugurated Dec. 8; he was the first civilian president chosen in ten years. Benavides was named ambassador to Spain. Prado pledged himself to a middle-of-the-road and democratic policy, but it was alleged that more than 1,000 political prisoners remained jailed, and many opponents of Benavides continued in exile. Later, however, Pres. Prado moved toward a general restoration of civil liberties.

Anti-axis Policies.—Peru declared its strict neutrality

upon the outbreak of World War II in Sept. 1939. From even before the beginning of hostilities, Peru had been made a centre of axis intrigue and propaganda, partly because of the considerable numbers of axis aliens in the country (est., in addition to the large Japanese colony, at 2,100 Germans plus 1,900 citizens of German descent and 7,600 Italians plus 4,000 citizens of Italian descent). The government issued decrees against profiteering in order to ease the economic dislocation caused by the war. Peru adjusted its international policy in general accord with that of the United States, and supported that government in its hemisphere defense proposals at the second inter-American foreign ministers' conference at Habana, Cuba, in July 1940. U.S. efforts to obtain naval base rights on the northern Peruvian coast failed, however. Several popular demonstrations of anti-axis feeling occurred in 1940 and 1941. The government took over and nationalized the Italian Caproni aircraft assembly plant near Lima and supplanted an Italian military and aviation mission which had been stationed for some years in Peru with one from the United States. A more dramatic development occurred in May 1941, when crews of five German ships sought to escape from Callao harbour and then scuttled their vessels when it became clear that Peru proposed to follow the United States' lead in seizing such vessels. The Peruvian government in retaliation forbade Transocean, the German news agency, to carry on operations in the country, withdrew diplomatic immunity from axis mail pouches, and cancelled the concession to the German Lufthansa airline, confiscating its planes; it also took steps to freeze German and Italian credits. After the Japanese attack on Pearl Harbor in Dec. 1941, Peru promptly froze Japanese credits and granted the United States nonbelligerent rights.

There was a considerable reorientation in the policy of the Apristas, who formerly had strongly opposed the alleged imperialism of the United States in Latin America but by 1940 were increasingly convinced that the greater menace was that of a victorious axis.

Boundary Dispute with Ecuador.—The long-standing boundary controversy with Ecuador, meanwhile, had been causing difficulties. Negotiations for an amicable settlement of the dispute had been started in Washington, D.C., in Sept. 1936, with an agreement to accept U.S. arbitration in the event of the failure of direct negotiations. Friction along the frontier became acute in June 1937, with the dictators of both disputing countries being unwilling to make concessions or to appear conciliatory lest the attitude be capitalized upon by opposing domestic political factions. The immediate crisis passed, but the dispute itself was no nearer a settlement. It involved more than 100,000 sq. mi. of land, chiefly in the Ecuadorian Oriente, a triangular strip east of the Andes mountains.

The dispute flared into prominence again in 1941. Border friction was renewed in Jan. 1941, following which Brazil, Argentina and the United States offered mediation of the dispute, which both countries accepted. Ecuador insisted, however, that any mediation or arbitration must include a decision of sovereignty over the coastal province of Tumbes, thus reviving a long-dormant claim; the nearby province of Jaén was also involved in part. Inasmuch as Tumbes had been under effective Peruvian occupation for more than a century and was inhabited largely by Peruvians, the effect of Ecuador's claim was to arouse strong feeling in the former country. Border incidents were almost daily occurrences by July, and at that

time Peruvian forces expelled Ecuadorian troops not only from the disputed points but from additional territory that was unquestionably Ecuadorian. This drastic action, assertedly undertaken in retaliation for attacks by Ecuadorians, brought the two republics to the verge of war. Withdrawal of the Peruvian forces was brought about only after pressure exerted by foreign governments. The mediating states and others at length persuaded the two disputants, on Oct. 2, 1941, to agree to the establishment of a 15-km. neutral zone patrolled only by Ecuadorian civil authorities. The agreement became effective Oct. 10 and, although it was temporary, it served to prevent further clashes while mediation efforts were continued.

When interforeign office discussions were under way, soon after the U.S. entrance into World War II, looking to the early convening of the third inter-American foreign ministers' conference, Ecuador temporarily threatened to disrupt the plans by insisting that the boundary dispute with Peru be placed on the conference agenda. Peru finally consented to have the matter discussed at the Rio de Janeiro conference and, although the question was not officially placed on the program, prominent delegates at the conference, notably Undersecretary Sumner Welles of the United States, were active in attempting to find a solution not only for the repeated incidents of 1941 and earlier but also for the disputed boundary itself. Just before the conclusion of the conference, it was announced that the dispute had been settled and the boundary delimited in general. By the agreement, Peru received full sovereignty over the major part of the disputed Amazonian territories and its claims to the Tumbes area were upheld. The disputing governments then created a joint boundary commission and, with technical assistance from the United States, Brazil and the other mediating governments, began the protracted job of surveying and fixing the boundary.

Representatives of the two countries involved signed an agreement at Rio de Janeiro on May 20, 1944, definitely settling four of the six sections of the boundary. Demarcation of four sections was settled to the mutual satisfaction of both disputants by 1944. The fifth and sixth sections of the boundary were left to a Brazilian arbitrator; the Brazilian government later appointed a naval officer for that purpose. The Peruvian and Ecuadorian foreign ministers exchanged notes on May 23, 1944, accepting the settlement.

Internal Problems.—Peru was free, as a result of the settlement, to turn its attention to some of the other problems facing the republic. The government paid considerable attention to projects for the development of Peruvian agricultural and industrial resources, both as temporary expedients to relieve the economic distress during wartime and also as measures to avoid similar troubles in the future. The government also rapidly pushed its highway program, especially the completion of the road across the Andes to Pucallpa on the Ucayali river, a tributary of the Amazon; the road was designed to provide more direct access to Iquitos, centre of Peruvian settlement in the Oriente territory. Peru and the United States concluded ten agreements during the year, some as the result of a series of conferences at Washington, D.C., in April between U.S. officials and Minister of Finance and Commerce David Dasso, and others as a consequence of an official visit to the United States the following month by Pres. Prado. The agreements included contracts for U.S. purchase of Peruvian rubber, cotton (in this case, for Peru's entire surplus), rotenone and flax. The commodity agreements generally provided for U.S. financial aid in developing production, and for the purchase of all exportable output; U.S. agencies also purchased exportable surpluses of copper and other minerals. The two governments concluded lend-lease and reciprocal trade agreements on Mar. 11 and May 7, 1942, respectively.

Peruvian tin plant at Oroya, where the metal is produced electrolytically

Peruvian problems during 1943 continued to be primarily internal. Imports were limited because of lack of shipping and priorities, and some unrest was caused in April and June by food shortages, caused partly by a poor rice crop the preceding year. The government found it necessary, in consequence, to take over all supplies of rice and beans, and to fix prices on these staple foodstuffs. The government on Aug. 27, 1943, established a central price control board in an attempt to hold down rapidly rising prices as far as possible. The government also endeavored to direct agricultural effort away from production of the staple crops, cotton and sugar, and toward diversified food crops. In an effort to increase diversification, a co-operative agreement was signed with the United States on May 19, the latter government agreeing to provide technical aid. A herd of zebu cattle, which had been purchased in Brazil to cross with native cattle, arrived in Peru in July. The Inter-American Co-operative Food Production service, a joint Peruvian-U.S. venture, undertook the development of new acreage, production and dry farming. U.S. technical assistance was also made available in 1943 for a health and sanitation program.

The United States Metals Reserve company signed a general agreement with the government of Peru in July 1943 by which the United States committed itself to buy all strategic materials up to 125% of 1942 exports; the list of materials involved included such vital ores as antimony, copper, lead, mercury, molybdenum, tungsten, vanadium and zinc. An important industrial project got under way during 1943 in the formation of the government-directed Santa corporation, with a \$15,500,000 capitalization. The project was designed for the general development of the valley of the Santa river in northern Peru, somewhat along the lines of the TVA in the United States. It was hoped that the corporation could develop Peru's untouched iron ore deposits and accessory transportation facilities to such an extent that the republic would be independent in iron and steel needs. The 522-mi. highway connecting the Pacific coast with the Ucayali river was opened Sept. 7, 1943, and the government announced plans for other trans-Andean links.

Peruvian capital began in 1943 to purchase many enterprises formerly owned by axis nationals and subsequently expropriated by the Peruvian government. The Japanese residents caused additional concern during the year because of their key positions in some fields of production; as a consequence, the government rigidly limited their activities and freedom of action. A fire on May 10, thought by some to be of incendiary origin, caused the destruction of the National Library of Peru, with the loss of many priceless manuscripts. A campaign was subsequently started to try to restore the collection by gifts insofar as this was possible. The Library of Congress of the United States donated photostatic copies of many early Peruvian manuscripts in its collections, and other donations were received from practically all countries of the hemisphere.

The government announced on Jan. 14, 1944, that a German-Japanese plot scheduled for New Year's eve had been thwarted; the plot would have started, it was alleged, with anti-Semitic outbreaks. Several enemy aliens were arrested in the following days, and the government on Jan. 22 decreed the liquidation of German banking interests and the sale of expropriated axis property, with the proceeds to be used for the repatriation of Peruvian bonds. Lt. Gen. George H. Brett of the U.S. Caribbean defense command arrived in Lima Feb. 8 for two days of discussions about defense problems. On July 10 representatives of Peru and the United States signed an agreement for

a third United States military mission, to last for four years. The Peruvian-U.S. food agreement was on Aug. 3 extended to Aug. 31, 1945; the two governments on Aug. 12 concluded an agreement for construction of a penicillin plant in Peru. The Office of the Coordinator of Inter-American Affairs, a U.S. agency, signed an agreement with Peru on March 16 extending for three years the health services it had been rendering, and on April 5 it concluded an arrangement for a co-operative development of Peruvian educational facilities.

In anticipation of the 1945 presidential elections, party activity increased greatly during 1944. The National Democratic front, an antiadministration coalition, was formed in June and advocated free suffrage, a civilian president in 1945 and uncontrolled elections. On Nov. 25 the cabinet set the election date for June 10, 1945; it provided that the number of senate seats be increased from 48 to 54 and seats in the chamber of deputies from 140 to 156. Several high officials resigned their posts on Dec. 8 in observance of the constitutional requirement that candidates must resign public offices six months before an election. The government announced on May 6 that it would purchase the entire rice crop of the year in order to control costs and distribution. The United Kingdom resumed its cotton purchases late in September.

The presidential election of June 10, 1945, was said to be the first free election in several decades. Maj. Gen. Ureta announced his candidacy formally March 16, and on March 19 the candidacy of José Bustamante Rivero, recently resigned ambassador to Bolivia, was launched by the Frente Democrático Nacional, the antiadministration coalition with the long-suppressed Apra as its chief component; the latter group was later legalized as the *Partido del Pueblo* (Party of the People). Gen. Óscar Benavides, who, it was widely thought, would emerge as the principal antiadministration candidate, did not announce himself. Various Aprista exiles, including the well-known Luis Alberto Sánchez and Manuel Seoane, returned to Peru May 8 after amnesty had been granted. The election was held as scheduled, without serious disorder and with a large vote cast. Final results gave Bustamante 305,590 to 150,720 votes for Ureta. Democratic elements hailed the election as one of an increasing number of instances in Latin America in which the candidate of the "outs" triumphed; the election was also pointed to as a significant example of a civilian victory over a military candidate. Bustamante was inaugurated July 28.

The government on Feb. 12 acknowledged a state of belligerency with Germany and Japan; Peru signed the United Nations pact Feb. 14. The United Nations charter was ratified Oct. 15. A government decree on Jan. 6 required all non-Catholic religious activities to be held privately inside their respective churches. Pope Pius XII on Jan. 12 created three new Peruvian dioceses and on Dec. 23 announced the elevation of Giovanni Guevara, archbishop of Lima, to be Peru's first cardinal. The government on March 16 frustrated a revolutionary plot at the Ancón air base north of Lima. The chamber of deputies on Aug. 6 approved a diplomatic break with Spain and urged establishment of relations with the soviet union. A political crisis early in October resulted in the choice of a complete new cabinet on Oct. 5. The public debt, largely in default, was regularized by announcement on Aug. 27 of plans to resume servicing. Finance Minister Montero Bernales introduced three bills on Oct. 24 aimed at controlling inflation, restoring foreign and domestic credit

and reforming the functions of the Central Reserve bank. U.S. purchases of metals and minerals were cut back considerably in 1945. Pres. Bustamante on Dec. 16 signed a free-press law, eliminating control by the supreme court.

A new cabinet, named Jan. 24, 1946, included for the first time three members of the Party of the People (formerly Apra). The Apra gained substantially in both houses of the congress in elections held June 30, winning 2 senators and 11 deputies; the opposition was then left with only 2 senators and 4 deputies. The electoral jury (a qualifications board) subsequently disqualified one Apra deputy but the party gained two more by "conversion." Some disorders occurred during the year, notably an attack by an Aprista mob on an opposition demonstration and newspapers on April 13, and, at various times, riots caused by food shortages; a brawl between U.S. army and Peruvian navy personnel occurred at Talara July 28. The government early in the year announced extensive plans for promotion of tourist trade, stating that 13 government-financed tourist hotels were either planned or under construction and that 15 others had been completed within the previous five years. The International Petroleum company revealed plans for construction of a completely

modern industrial town near Talara at a cost of 10,000,000 soles (1 sol valued at 15.38 U.S. cents); it was announced on June 9 that rich oil resources had been discovered in the Andean foothills. The government laid plans early in 1946 for the inauguration of the new Lima-tambo airport near Lima, one of the largest in South America, on July 28.

Pétain, Henri Philippe

Pétain (1856–), French army officer and statesman, was born May 24, 1856, at Cauchy la Tour in the Pas-de-Calais department of France. He attended St. Cyr military academy and was commissioned an officer after graduation. Rising to the rank of colonel in 1910, he was in command of an infantry regiment at the outbreak of World War I.

Pétain distinguished himself in the fighting at Artois (1914) and Arras (1915); he was made commander of the 2nd army with the rank of a full general in June 1915. Although his reputation declined after the costly Champagne offensive in Sept. 1915, it rose again with his successful defense of Verdun in 1916. Made a marshal of France on Nov. 21, 1918, he led French forces which put down the Rif revolt in 1925 and in 1934 he was made minister of war in Gaston Doumergue's cabinet.

Called from virtual retirement in 1939 to become ambassador to Spain after Francisco Franco's triumph, he remained in this post until May 18, 1940, when he was summoned to Paris to act as vice-president of the government council and adviser to the minister of war. As France's armies were unable to check the German onrush, Pétain, who succeeded Paul Reynaud as premier, sued for peace and concluded the armistice of June 22, 1940, with Adolf Hitler. Pétain moved his government to Vichy in unoccupied France and authorized Pierre Laval to prepare a new constitution. Pétain named Laval his successor, but dropped him from the cabinet on Dec. 13, 1940.

Pétain meanwhile had assumed dictatorial powers. He submitted to Nazi deportation of French workmen for labour in Reich factories in 1941 and 1942, and bitterly protested the Allied landings in North Africa on Nov. 8, 1942, severing diplomatic ties with Washington. He also opposed German occupation of all France Nov. 11, 1942, terming this action a violation of the armistice terms. In May 1943 Pétain conceded that "open opposition" to his policies had slowed the "reconstruction" of France. He did not greet the Allied landings in Normany June 6, 1944, with enthusiasm, appealing in a broadcast the same day to Frenchmen to refrain from actions that would result in "tragic reprisals." As the Allied armies drove deeper into France, Pétain allegedly rejected a German offer of haven in the Reich; as a result, the Germans reportedly placed him under arrest, forcibly transporting the marshal to German soil. The German radio's version (Sept. 30, 1944) of this incident was that Pétain had voluntarily fled to the Reich.

As the defeat of Germany drew near, Pétain entered Switzerland in April 1945. He voluntarily returned to France on April 26, and was arrested at the border. On the opening day of his trial at Paris (July 23, 1945), Pétain asserted: "I sacrificed my prestige for the French people. If I treated with the enemy, it was to spare you." The theme of the accusations against the marshal was that he conspired to destroy the Third Republic and weakened its defenses before and during the war. The question of treason was side-stepped by many of the prosecution witnesses, who declared there were many "definitions" for the word. Pétain himself remained silent throughout most of the trial, presumably on advice of counsel, and rarely took the stand in his own defense. The tenor of the pleas in his behalf was that, although outwardly submitting to the Nazis, he had secretly defied them. He was found guilty on Aug. 15, 1945, on charges of intelligence with the enemy and was sentenced to death, but Gen. Charles de Gaulle commuted the sentence to life imprisonment.

Peter II

King Peter of Yugoslavia (1923–) was born Sept. 6, 1923, in Belgrade, the son of Alexander I of the house of Karagjorgjevič. When Alexander was slain in Marseilles in 1934, Peter succeeded to the throne; a regency headed by Alexander's brother, Prince Paul, was set up to rule until the young king reached his majority. The re-

gency and the pro-axis government of Premier Cvetkovitch was ousted when the army staged a coup in protest against signature of the axis pact, March 25, 1941, and Peter was placed on the throne. The new government headed by Gen. Simovitch refused to honour the treaty; as a result Hitler's armies invaded Yugoslavia, crushing its army in a fortnight.

Peter fled to London, where a Yugoslav government-in-exile was set up. Both Peter and his government were opposed to Marshal Tito's partisans, but the Allied decision to support the partisan movement compelled the king to agree to a working relationship with Tito, and the two Yugoslav regimes reached an agreement, June 18, 1944. Tito emphasized, however, that restoration of the monarchy would depend on the outcome of a postwar plebiscite. Reluctantly Peter consented to permit the royal delegates to proceed to Belgrade and participate in promotion of a single government under a regency. Tito's declaration of Aug. 7, that a monarchy was "incompatible" with a democracy in Yugoslavia, brought prompt reaction from Peter, who assailed Tito for having proclaimed a dictatorship. On Nov. 29, 1945, the Yugoslav constituent assembly proclaimed a republic and abolished the monarchy. Peter refused to accept the decision, but the U.S. and Great Britain recognized the republic, Dec. 22, 1945, thus writing off Peter's regime.

King Peter married Princess Alexandra of Greece, March 20, 1944, in London.

Petit de Julleville, Pietro

Cardinal Petit de Julleville (1876–), French prelate and archbishop of Rouen, was born Nov. 22, 1876, at Digione, son of a celebrated French historian of literature, Louis Petit de Julleville. Ordained priest in 1903, he served as superior of the Diocesan college near Paris. A chaplain in the French army during World War I, he was seriously gassed and was cited for courage under fire.

Elevated to the rank of bishop in 1927, he was named archbishop of Rouen and primate of Normandy in 1936. He remained in the city during the German invasion of 1940 and ordered his priests to leave the parishes only after the departure of the last inhabitant. He remained in his residence at the foot of the cathedral, which was under continual bombardment. When his residence was later ransacked, he moved to a little room in the Faubourg convent.

His nomination by Pope Pius XII to the Sacred College of Cardinals was announced Dec. 23, 1945, and he was proclaimed a cardinal at the consistory of Feb. 18, 1946.

Petrol

Petroleum

In the years prior to World War II, the trend away from private ownership of mineral rights toward the nationalization (government ownership or control) both of natural resources and of industries (cartelization) increased. Generally speaking, no other country recognized the surface landowner as the owner of the subsoil as did the United States. There were exceptions in some limited private titles existing in Canada, Colombia, Mexico, Trinidad, Rumania and Poland. Excepted, also, were certain private titles belonging to native princes in India, Burma and the two parts of British-controlled Borneo.

In the western hemisphere particularly nationalization

of the subsoil took place on an ascending scale. This was true in Argentina, Uruguay, Chile and Brazil, while Mexico and Bolivia furnished examples of nationalization accompanied by expropriation and seizure of foreign oil properties in 1938 and 1937 respectively.

Mexican Expropriation.—Oil production in Mexico, largely developed by U.S., British and Dutch interests, reached a peak of 549,000 barrels daily in 1921, second only to that of the United States. By 1926 it had dropped to 247,000 barrels and the following year to 176,000 barrels, or less than one-third of the 1921 peak. During the 1930s it averaged only slightly more than 100,000 barrels daily.

This production decline was the result of several causes in addition to the going to salt water of the prolific "Golden Lane" fields in the early 1920s. First, from May 1, 1917, until the end of 1926, no legislation existed by which petroleum lands not acquired prior to the nationalization of subsoil resources under the 1917 constitution could be explored or exploited, except under the conditions laid down in the Carranza decrees of 1918, the legality of which had been challenged in the courts and which precipitated years of diplomatic representation by the United States, British and Dutch governments on behalf of the private rights of their nationals in Mexico vested prior to 1917. Second, in the 1920s, petroleum and export taxation was greatly increased. Third, radical labour began to manifest itself in the 1930s, and a series of strikes greatly hampered operations.

In the meantime, important oil fields had been discovered in Venezuela, where the policy of the government was to encourage development by foreign capital. Many foreign companies in Mexico turned their attention to these new and more promising fields, and the period of liquidation and abandonment of Mexican investments began. Of the 22 major companies in Mexico in 1921, 7 definitely retired from business in that country, 6 with severe losses and the holdings of 9 others were absorbed by purchase by other companies. No new companies of importance ventured into Mexico during the 1930s except the semiofficial *Petroleos de Mexico*.

The support of foreign oil companies by their governments was ineffectual in the 1930s as agitation against foreign oil interests by radical labour elements in Mexico gathered momentum. Heavy awards to labour were made. Management was stripped of many of its normal administrative functions, and companies felt that justice was denied them in Mexican courts. Finally, as the result of their inability to carry out a labour award declared to be beyond their economic capacity, the Mexican government on March 18, 1938, expropriated properties of U.S., British and Dutch companies with few exceptions. This action substantially meant a retroactive application so long feared by the operators, since the Mexican government, in applying the decree of expropriation and the courts in interpreting it, did so on the basis that the subsoil had belonged to the government.

Certain U.S. companies made monetary settlements by direct negotiations with the Mexican government. The U.S. department of state insisted upon prompt, adequate and effective compensation, and in 1941 the Cooke-Zevada commission was set up which placed the value of expropriated properties of other U.S. companies at \$24,000,000 plus interest of approximately \$5,000,000, although the properties were valued by their owners at several times that amount.

An attempt to ascertain losses sustained by U.S. companies as a direct result of expropriation in Mexico was made by the group on American petroleum interests in foreign countries in its report to the special senate committee investigating petroleum resources (1945). Incomplete returns from only 4 companies showed an estimated net loss of more than \$80,000,000. England embargoed all oil from Mexico following the expropriation, an embargo still in effect in 1946. On Feb. 7, 1946, through an exchange of notes by the Mexican government with the Dutch and British diplomatic representatives, an agreement was reached for negotiating a settlement for the expropriated oil properties of Dutch and British nationals. Meantime, the Mexican oil industry became almost totally operated by the government-owned and controlled *Petroleos de Mexico*.

Seizure of U.S. Properties in Bolivia.—Following a change in the government's oil policy from one of approval of oil development by foreign interests, and the creation of a government-sponsored enterprise, *Yacimientos Petroliferos Fiscales Bolivianos*, the Bolivian government seized the properties of the Standard Oil Company of Bolivia on March 15, 1937, after the company had spent \$17,000,000 on exploration, the drilling of 28 wells and the construction of 2 small refineries, camps, roads and sanitation facilities. Finally the Bolivian government agreed to pay the Standard Oil company (New Jersey) a total of \$1,500,000 for the sale of all its rights, interests and properties in Bolivia and those of its subsidiaries, Standard Oil Company of Bolivia, as they existed immediately prior to the seizure. This represented a net loss of \$15,500,000 to the company.

Marketing Cartels.—In petroleum marketing, government monopolies or government-imposed restrictions or trade agreements adversely affecting foreign companies manifested themselves in Spain, Italy, France, Rumania, England, Portugal, Czechoslovakia, Hungary, Yugoslavia, Turkey, Argentina, Uruguay, Chile and other countries before World War II. In several instances the government itself cartelized the industry or set up a petroleum regime in which the government was represented by direct or indirect ownership or control of a local oil company. A foreign oil corporation often was either prohibited from doing business or could do business only as a minor stockholder of a national corporation.

During this period, U.S. oil companies invested a considerable amount of capital in refineries in foreign countries as a protection to their long-established marketing interests in these countries. Among the measures used to induce or force the building of such refineries were tariff differentials, foreign exchange restrictions, licensing of imports and refineries and government participation in refining.

Substitute Fuels.—Many governments imposed discriminatory excise taxes on imported petroleum products in order to stimulate the production and consumption of domestic products such as alcohol made from grain and other synthetic fuels. Germany built up a large synthetic gasoline industry by processing coal and lignite, estimated to be producing 33,000 bbl. daily in 1938, a fivefold increase over 1933, and to have 100,000 bbl. daily capacity before Germany invaded Poland in 1939.

World Demand Increases.—World consumption of petroleum products increased greatly prior to World War II, and it was significant that while total exports of these products from the United States mounted, the percentage relationship to total indicated foreign demand (exclusive of the United States) declined in the 1930s to 19.6% com-

pared with 32.6% in the 1920s. This was chiefly due to the development of oil production abroad by U.S. and other companies, the major proportion of which was marketed abroad. U.S. companies were able to supplement U.S. exports from foreign sources, while the Royal Dutch-Shell company and the Anglo-Iranian Oil Company, Ltd., also extended their activities and drew on foreign oil sources in increasing amounts, particularly in the middle east.

The United States, with 68.1% of world motor vehicle registration in 1938, accounted for 63.5% of the indicated total world demand for motor fuel. In 1938, the United States had a motor vehicle registration totalling 31,500,000 cars, with all other countries totalling 14,750,000. Nevertheless, registration outside the United States increased markedly during the interwar period. In 1919 it was only 14% of the total world and rose to 32% in 1938, from 1,125,000 to 14,750,000 vehicles. The U.S.S.R. showed the greatest rate of growth but had only slightly more than 1,000,000 vehicles or 2½% of the world total, virtually all commercial. Excluding the United States, Europe and Africa accounted for 64% of total motor vehicle registration and 54% of total motor fuel demand in 1938.

Modern distribution methods, especially for bulk distribution of gasoline through pumps and service stations, was accomplished in many European and Latin American countries. In fact, just prior to World War II, methods in many nations had reached almost the same degree of efficiency as in the United States. This was particularly true in such countries as England, France, Holland, Belgium, Sweden, Germany, Italy, Brazil and Argentina.

Petroleum companies which had learned to provide bunkering facilities for steamships at every port of call were forming world-wide organizations to supply fuel and lubricants to international airways as well as local airways prior to World War II.

New Production Sources.—The late 1930s witnessed large gains in oil production in the United States and in the middle east and in Venezuela. In the middle east, Iran increased production from 125,000 barrels daily in 1930 to 213,000 barrels in 1938; Iraq from 2,000 barrels to 89,000 barrels; added were the new fields on Bahrain Island and in Saudi Arabia, producing 22,000 and 1,000 barrels daily respectively in 1938. In Venezuela, output gained from 375,000 barrels daily in 1930 to 522,000 barrels in 1938.

Oil as a Vital Munition.—World War II demonstrated the supreme importance of oil as a munition. U.S. military gasoline consumption at the peak of World War II was 100 times that of its overseas forces at the peak of World War I. The U.S. army and navy had 600 times as many automotive vehicles as the A.E.F. had in Europe in 1918. The navy and merchant marine had more ships and more tonnage than the combined merchant fleets of the world after World War I. The U.S. army and navy operated 1,250% more planes before V-E day than they did before Pearl Harbor (Dec. 7, 1941). This was U.S. armament alone; the planes, vehicles and ships of the other United Nations likewise multiplied in number and consumed proportionately huge quantities of oil products.

The tonnage of oil products shipped overseas from the United States during the last few months of the war was almost double all other tonnage combined. U.S. overseas forces required nearly twice as many tons of oil as of arms and armament, ammunition, transportation and construction equipment, food, clothing, shelter, medical supplies and all other materials together. In both essentiality and quantity, oil became the greatest of all munitions.

Great as were the overseas petroleum requirements, two and one-half times as much oil was required for the war-

Ruptured ammonia tanks standing askew at Leuna synthetic oil plant in Merseburg, Germany, after repeated Allied air attacks in 1944. Systematic bombing of oil plants and refineries finally immobilized the German wehrmacht and luftwaffe

supporting economy at home in the United States. Even with rationing, conversion to coal and other oil-conservation measures, civilian consumption was not much below pre-Pearl Harbor volume, the savings being largely offset by the needs of a vastly expanded war industry.

Essential civilian consumption of other Allied and neutral nations, while not so great as that of the U.S., was no negligible item. The oil and oil products supplied from Allied sources to Allied and neutral civilian economies, not including the U.S.S.R. or consumption in the countries where the oil was produced, reached about 550,000 barrels a day, equal to 15% of the civilian consumption of the United States.

The job of fuelling and lubricating the war was worldwide. Crude oil came from 20 Allied, neutral and liberated countries on 5 continents. Some of it was refined near its point of production, some had to be moved to the refineries and the refined products to the points of need. The transportation facilities of the five continents and the seven seas had to be utilized. The global war demands meant global production, global refining and global distribution.

Petroleum Organization for War.—The petroleum organization for war which fuelled the United Nations to victory centred around the U.S. oil industry and the U.S. Petroleum Administration for War, inasmuch as U.S. oil was called upon to supply the bulk of the United Nations' needs.

In the United States the Office of Petroleum Coordinator was created on May 28, 1941, in which President

Roosevelt designated Secretary of the Interior Harold L. Ickes as petroleum co-ordinator for national defense. On June 4 Secretary Ickes appointed Ralph K. Davies as deputy petroleum co-ordinator.

The OPC functioned after the U.S. entered the war. It was not until Dec. 1942, when the executive order was issued establishing the Petroleum Administration for War to succeed the OPC, that the government oil agency, while by no means given full control over all petroleum matters, received a greater grant of authority. The Office of Price Administration, for example, still continued to establish ceiling prices on petroleum products and was responsible for rationing to civilian consumers.

Secretary Ickes became petroleum administrator and Davies deputy petroleum administrator. The Petroleum Administration for War, with national and district offices and functional committees, was staffed with men who knew the oil business, 90% being drawn from the petroleum industry. The industry and PAW were a closely co-ordinated team—a combined task force. Their government-industry partnership was unique.

PAW acted as a general staff. It gathered data as to future requirements in the United States and elsewhere from the army, the navy, the War Shipping administration, the Office of Defense Transportation and more than 20 other domestic and foreign sources. With the corresponding British organization (British Petroleum office) it analyzed the data and estimated military and essential civilian requirements 18 months or more ahead. It estimated the supplies obtainable from each available source to meet these requirements.

Week by week it revised its estimates and programmed operations to meet new demands, changed conditions and emergencies. Under the guidance of PAW, the program was implemented by industry committees and the industry itself. The strategic Petroleum Industry War council, with William R. Boyd, Jr., president of the American Petroleum institute, as chairman, was composed of executives and association leaders serving voluntarily as individuals representing the industry as a whole. Thus, requirements and supplies were correlated and programmed months in advance and from week to week, and the program was implemented day by day. "The war was not supplied with oil by haphazard improvisation," Deputy Petroleum Administrator Davies told the Special Senate Committee Investigating Petroleum Resources on Nov. 28, 1945. "The operation succeeded because it was planned."

Pre-Pearl Harbor.—The outstanding factor in world petroleum at the outbreak of war in Europe in 1939 was, of course, that of supplying war needs and keeping supply lines open. In all warring and many neutral countries, civilian use of petroleum products was stopped or curtailed.

During 1940 and until the Japanese attack on Pearl Harbor in Dec. 1941, the United States was the great supply source for the Allies' ever mounting requirements of food, planes, tanks and oil—the "arsenal of democracy" under the Lend-lease act.

The U.S. oil industry had been supplying the British with 100-octane aviation fuel and other petroleum products before the United States entered the war. It had put the first commercial 100-octane gasoline plants into operation in 1938 and was producing alkylate, a much-needed aviation gasoline ingredient, in quantity.

After 1940 through conversion and new construction the oil industry's production of aviation gasoline and its in-

gredients increased many times. In the battle of Britain the R.A.F. pilots fought with 100-octane fuel; the nazis had 87. English fliers turned back the invaders with planes which had the extra rate of climb, higher speed, greater manoeuvrability possible with the higher octane fuel. This fuel made possible the construction of an aeroplane which could fly one-fourth farther on a given amount of 100-octane gasoline than on 87. Of 2 big bombers flying to a target 1,000 mi. distant, the one using 100-octane fuel could carry 5,000 lb. more bombs than the one burning 87-octane. The extra power available from higher octane fuel could similarly be spent on some combination of air-fighting advantages, such as additional armour, higher ceiling, greater agility in "dog fighting" and shorter take-off.

In the United States, war construction was rushed on toluene for explosives, and later on butadiene for synthetic rubber, and many less known petroleum products of great importance to the armed forces.

Tankers in "Battle of the Atlantic."—Before Pearl Harbor, the axis waged fierce submarine warfare in the Atlantic against Britain's and the U.S.S.R.'s lend-lease supply lines, concentrating its attack against tankers, for these ships were moving vital oil power for planes, tanks and other instruments of combat to the European war fronts. The toll taken by Hitler's numerous and powerful U-boats was so heavy that U.S. tankers were diverted to British use, resulting in a shortage of gasoline and fuel oil in the Atlantic seaboard states.

After Pearl Harbor and the U.S. declaration of war against Japan, Germany and Italy, the "battle of the Atlantic" took on new fury. Again tankers were the special targets of axis submarines, and U.S. oil companies turned their fleets of ocean-going tankers over to the U.S. maritime commission. These vessels were still operated by the companies but under orders of the navy department.

Gasoline and fuel oil rationing in the United States was inaugurated in 1942.

To meet essential home and industry needs and the war shipments overseas, railroad tank cars were mobilized from oil field and refinery to the east coast in an organized shuttle; westbound pipe lines were reversed, new ones built; oil barge lines were operated and expanded on inland waterways. For further relief and expanded supply, the War Production board in June 1942 approved the construction of a "big-inch"—24-inch—pipe line, the largest diameter oil pipe line on record—to run from Texas to Norris City, Ill., and later extended building authorization to the New York-Philadelphia refinery areas, (see below.)

Nazi Oil Conquests.—By military conquest or control, Germany had added vast sources to its own total annual natural petroleum home production of 4,438,000 bbl. (and an unknown stepped-up output of synthetic fuel) by the end of 1942. When Hitler took Czechoslovakia and Poland in 1939, having previously occupied Austria, he added an annual oil production of 4,100,000 bbl. He added France and Hungary in 1940 (about 3,000,000 bbl.) and Rumania in 1941 (38,000,000 bbl.). Italy had a small production of 46,000 bbl. and added Albania, 1,400,000 bbl., in 1941. In 1942, the Maikop-Kutan field in the soviet union, with an annual production of 17,000,000 bbl., was taken. Thus, the petroleum production under German-Italian control totalled about 68,000,000 bbl., much of which was available because there had been only desultory destruction by the Allies.

However, during those three years of the war, Hitler drew heavily upon the oil reserves built up in preparation

for the Nazi blitz. The bulk of the increased demands for petroleum products created by his augmented mechanized armies, air fleets and sea craft had to be met by increased production of synthetic fuels and oils from coal. And as the year 1942 closed, Hitler's drive for Russian and middle eastern oil had stalled. The high barrier of the Caucasian mountains still lay between the farthest advance of the Nazi Wehrmacht and the rich Baku oil fields in the U.S.S.R. and the equally rich oil fields in Iran and Iraq.

Although Iraq passed under the control of the Allies in 1941, oil shipments from that country to the Mediterranean were not resumed after the British occupation because of the difficulty of Mediterranean oil transportation. On the other hand, the Iranian oil fields furnished increased amounts of oil because shipment could be made southward by way of the Persian Gulf.

Japan's Oil Conquests.—The score of oil conquest by the new axis partner, Japan, was highly impressive in 1942. Japan's domestic production was insignificant—2,659,000 bbl. in 1941. By the conquest of the Netherlands East Indies, Burma, Sarawak and Brunei, it gained control of countries having a total annual oil production of 68,366,000 bbl., although Japan was unable immediately to secure from these fields a production as large as that because of the demolition of wells, refinery equipment and the like.

U.S. victories in the Pacific powered by an air-sea team of battle fleets and aircraft carriers demonstrated the tremendous importance of oil supply. U.S. task forces dealt staggering blows to the Japs in the Marshalls and elsewhere, covering great distances from their naval bases.

As the war against Japan advanced, superior U.S. plane and gasoline power accounted for Japanese plane losses at the ratio of 11 to 1, as compared with the United States.

It was a titanic battle of lengthening supply lines, as the Japanese were successively rolled back and stripped of island defenses.

Allies Retake Oil Fields.—In 1943 Russian armies not only successfully defended the Caucasian oil fields and wrested Maikop from German hands, but by the end of the year were pressing axis forces toward the Polish and Rumanian borders, thus putting the oil fields of those countries, which were the only large sources of natural petroleum within the home and conquered territories of Germany, within striking distance of air forces.

Of no less strategic importance was the successful Allied campaign in North Africa and Sicily, which cleared the Mediterranean and shortened the supply lines of the Allied armies. Coupled with the successes attained against German submarines in the Atlantic, these campaign results meant a virtually uninterrupted flow, with very little loss, of oil to the armies and navies of the United Nations and to the war industries of Britain. The Russian and African successes also removed the threat of invasion or partial blockade existing against the Iraqi and Iranian oil fields, giving the United Nations a chance to draw more heavily upon these sources.

Miracle of 100-Octane Gasoline.—Only a few decades before, 100-octane gasoline had been a laboratory experiment which cost \$30 a gallon to make. As the war continued, 100-octane was being made at a cost only a few cents higher than that of motor gasoline. The base was gasoline made from highly selected crudes. To this was added synthetic blending agents which increased the anti-knock rating of the base stock. In addition, tetraethyl lead was employed to increase even more the anti-knock rating of the finished product. Thus a superfuel was developed which was actually well beyond the anti-knock rating of pure iso-

Loading a gasoline tank car at Camp Pickett, Va., assembly depot for shipment to embarkation point and thence to war fronts. The tank had a capacity of 5,083 gallons

octane, from which 100-octane gasoline obtained its name.

In May 1941 there were 16 plants in the United States equipped to make 100-octane; and 4 in the rest of the Allied and neutral world. Their combined daily capacity was about 44,000 barrels.

By the end of the year, there were 73 100-octane plants

in the United States, 10 in Allied countries, 4 under construction in the Soviet Union and more being built when V-J day came. Some 400 other refineries and natural gasoline plants in the United States contributed base stock, components or other factors to the aviation gasoline program.

Each year's output more than doubled that of the preceding year. Output for 1944 was greater than all preceding years together. Output for March 1945 was 525,000 barrels a day in the United States and more than 600,000 barrels in the United Nations excluding the U.S.S.R., an increase of 1,265% over the world's total capacity in May 1941.

Oil for Synthetic Rubber and Toluene.—With the conquest by Japan of the Netherlands Indies, from which the United States secured more than 90% of its natural rubber, motor-dependent U.S. faced one of its most serious problems—rubber scarcity. The U.S. petroleum industry, however, knew how to get butadiene from petroleum, one of the principal components of buna S (synthetic) rubber. Butadiene is a gas which under pressure becomes a liquid and is produced from butane and butylene, both oil products. It may also be made from alcohol.

It became the U.S. oil industry's job to provide the butadiene to produce synthetic rubber in tremendous volume, to meet the growing military needs and to keep the domestic economy functioning.

Huge plants for making butadiene from petroleum products were built and operated by the oil companies under the government's synthetic rubber program, and by 1944 U.S. rubber plants were producing at a rate nearing 800,000 tons of synthetic rubber annually, with synthetic rubber going into tires for trucks, tanks and jeeps, linings for bulletproof gas tanks and many other items.

For bombs, torpedoes and shells, the basic explosive used was T.N.T. made from toluene. Toluene was a rare and expensive substance during World War I, when most of it was a by-product from the coking of coal. So great were the demands of the Allies in World War II for T.N.T. they could never have been met from coke-oven sources. Fortunately a way had been found to make toluene from petroleum. Toluene plants were built under government program. Pure toluene was turned out from petroleum refineries in great quantities. Tri-nitroglycerin and picric acid explosives were also made from petroleum.

In the production of toluene, the charge used is a straight run gasoline extracted from crude oil. This is run into a series of fractionating columns where the toluene is extracted. The product was delivered to T.N.T. producing plants and eventually found its way into the bombs and shells.

Bombing of Axis Oil Facilities.—The year 1944 was one of increased crisis for Germany because of military events affecting its oil supplies. Resurgent Soviet armies wrested from Germany its main sources of natural petroleum, leaving it dependent on stored reserves and synthetic fuel production from coal. With the advance of the Allied armies through France and the establishment of air bases on the continent, German synthetic oil plants were subjected to intensive bombing. By the end of 1944, reports multiplied that the Nazi war machine was experiencing difficulties because of oil shortage and poor quality of available oil supplies.

"The U.S. 8th Air Force," according to Lt. Gen. James H. Doolittle, its commander, "used 88,800,000 gal. of aviation gasoline in March 1945, an average of almost . . .

3,000,000 gal. per day. The building up to this peak production actually provided the fuel which set fire to and devastated a great part of Hitler-held Europe. From May 1944 to April 1945 the 8th Air Force, together with the 15th Air Force and the R.A.F. Bomber Command, undertook and succeeded in destroying the German oil industry. The 8th destroyed the 7 large synthetic plants in central Germany: the largest plant at Politz on the Baltic—and the 20-odd refineries in Germany. The 15th concentrated on the Silesian plants and the major refineries of Rumania, Austria, Hungary and Czechoslovakia, while the R.A.F. took on the destruction of the 10 large plants in the Ruhr.

"In this period of 11 months, the 3 air forces dropped more than 200,000 tons on synthetic plants, refineries and benzol plants; 555 separate attacks were made on 133 targets. In addition, more than 35,000 tons of bombs were dropped on reserve oil depots and dumps supplying the German armies, navy and air force. Of this gigantic total, the 8th made 222 attacks on 66 producing plants, dropping 67,000 tons—and sent another 15,000 tons into depots and dumps.

"The result of this combined effort was truly devastating, for by April 1, 1945, every known synthetic plant and major refinery in Axis-held territory had been attacked and every one of these had been put out of production at one time or another. Production at one time was reduced to 7 per cent of normal. First strategic and then tactical reserves were used up. Then, the mobility of the great Wehrmacht was impaired to the point where our troops had an overwhelming advantage—out of all proportion to numbers and equipment."

Destruction of oil facilities proved equally effective in the war against Japan. Allied submarines had cut the Netherlands Indies oil supply lines. Prior to V-J day, Japanese home island rates of production of petroleum

Excavation for the "Big Inch" petroleum pipe line, connecting Longview, Tex., and the eastern states. The line was completed in 1943

products had been reduced to 65% of requirements at the July 1945 monthly rate of consumption. Air attacks had put out of operation 100% of Japan's high-grade lubricating oil capacity.

While the Japanese had a considerable surplus of refining capacity at the end of the war, B-29 attacks during 1945 against 11 of the largest and most modern refineries in the home island had, nevertheless, rendered these refineries useless. Japan's inability to ship oil from the East Indies islands had also given it a large excess oil storage capacity, but air attacks reduced that capacity by nearly 6,000,000 barrels.

War Pipe Lines in U.S.—When the war began there were roughly some 126,000 mi. of pipe line in the United States. Much of this system had to be rearranged and systematized to permit it to meet wartime requirements. The direction of flow of hundreds of miles of pipe line was reversed. Old pipe was dug up, salvaged and relocated. Several hundred miles of natural gas pipe lines were converted to oil service.

In record time, some 3,400 mi. of new pipe lines were built to transport millions of gallons of both crude oil and refined products which could not have been transported by tank cars or tankers.

These new pipe lines ranged from the "Big Inch" and the "Little Big Inch" line—a 20-in. war emergency pipe line for refined products also from Texas to New York—to smaller but important lines in various parts of the country.

The "Big Inch," built with government funds by oil pipe line people and operated as a co-operative enterprise in which leading oil companies shared, began operating to Norris City, Ill., and to New York. A total of around 260,750,000 barrels of crude oil had been pumped through this line up to V-J day.

The "Little Big Inch" provided for overland transportation of finished petroleum products from the southwest to the New York harbour area terminals, 1,475 mi., from Beaumont, Texas, with a rated capacity of 235,000 barrels of gasoline daily. Actual construction was started in April, and the line was completed in Dec. 1943 at a cost to the government of more than \$67,000,000. Because of extensive testing, deliveries to the east coast were not started until March 1944. Up to V-J day, this line had delivered to the Linden, N.J., station a total of about 107,125,000 barrels of products.

These two lines, together with the southwest emergency pipe line, Ohio emergency pipe line, Plantation pipe line extension and Florida emergency pipe line provided facilities capable of delivering a total of approximately 632,000 barrels per day to the eastern seaboard for shipment abroad and for vital domestic industrial and home needs.

Although quick development of petroleum transportation facilities to the east coast was of paramount importance, it was also essential that pipe lines be constructed from oil fields in west and southwest Texas, Louisiana, Mississippi, the Rocky mountain states and California to deliver crude oil to refineries or terminals in the same general areas or in the middle west. Included in the 9,930 mi. of new lines constructed under the nation-wide wartime program were the 6 government-financed projects previously named and 29 major projects privately financed by industry, each of which cost \$500,000 or more.

Ocean Tankers.—When the Big Inch lines were being built, the tanker construction program appeared hopelessly stymied for lack of steel. Later, large-scale construction was resumed and, although there were interruptions, new tankers were coming off the ways right down to the

One of the 13 steel hortonospheres used in the production of synthetic rubber at the Polymer plant in Sarnia, Ontario

end of the war.

Despite all losses, the U.S. tanker fleet increased during the war from 217 ships totalling 2,530,000 dead-weight tons to 763 ships totalling 11,406,000 tons, an increase of 250% in number of ships and 350% in tonnage.

These tankers also showed a marked increase in size as well as in numbers. At the start of the European war the tankers of the United Nations averaged 10,000 dead-weight tons each; at the end of the war they averaged nearly 12,500 tons.

If the Pacific war had continued, however, tanker space would soon have been critical again, according to Deputy Petroleum Administrator Davies.

Revival of Oil-Shortage Scare, 1943-44.—There was a revival of the oil-shortage scare in 1943-44 reminiscent of that immediately following World War I. It centred, as did the earlier one, on the heavy drain being placed on U.S. oil to meet military requirements, and on fear for national security.

Petroleum Administrator Ickes announced the formation of the government-sponsored Petroleum Reserves corporation, in Nov. 1943, chartered to construct foreign refining and pipe-line facilities, and otherwise to engage in world-wide oil operations.

He said that, since government assistance and participation in foreign oil development might be necessary for U.S. companies "from now on, the Petroleum Reserves Corporation is available for this purpose." Directors named were the secretaries of state, war, navy, and interior and the administrator of the Foreign Economic administration.

Early in 1944, announcement was made of a projected Arabian pipe line sponsored by the Petroleum Reserves corporation under a proposed agreement between it and the Arabian-American Oil company and the Gulf Exploration company. Under this agreement, the government

upon "recommendation of the War Department, Navy Department, Joint Chiefs of Staff, and the Army and Navy Petroleum Board and with the approval of the Department of State" agreed "to construct and to own and maintain a main trunk pipe-line system, including requisite facilities, for the transportation of crude petroleum from a point near the presently discovered oil fields of Saudi Arabia and Kuwait to a port at the eastern end of the Mediterranean Sea," the companies maintaining and operating the line.

After wide public discussion of the proposed project, it was dropped by the middle of 1944, and the project as proposed did not materialize. The Petroleum Reserves corporation never functioned and was later absorbed by another government corporation.

Anglo-U.S. Oil Agreement.—Further attention was given to U.S. oil participation abroad in proposals for an Anglo-American Oil agreement. In July 1944, representatives of the British government met with those of the U.S. government in Washington in a series of oil conferences that resulted in the promulgation of an Anglo-U.S. oil agreement dated Aug. 8, 1944. The agreement was "to assure the orderly development of petroleum resources for international trade and to provide the basis for a multilateral world-wide oil accord in the postwar era." It was signed by the state department, Edward R. Stettinius, Jr., acting secretary, and by Lord Beaverbrook, lord privy seal.

President Roosevelt submitted the agreement to the senate in the form of a treaty for ratification on Aug. 24, 1944. After wide discussion the agreement was withdrawn by the president from the senate for further study. Revisions were made and a new Anglo-U.S. oil agreement, also designed to form the basis of a multilateral agreement to which other countries could affix their signatures, was signed Sept. 24, 1945, in London by U.S. Petroleum Administrator Ickes and Great Britain's Fuel Minister Emanuel Shinwell. Late in 1945, President Truman submitted this agreement to the senate for approval as a treaty. No further action was taken in 1946.

War Drain on U.S.—World War II caused a heavy drain on the oil fields of the United States. One-fifth of all the oil ever produced in the United States came out of the ground during the war. In May 1941 average daily production of crude oil was 3,772,000 barrels. In May 1945, after 4 years of unprecedented withdrawals, the daily average was 4,859,000 barrels, an increase of 29%.

Such a sustained rate of production was possible only because the United States entered the war with a large reserve of productive capacity, the result of earlier years of successful exploration and of increased practice and enforcement of the principles of oil conservation. In the summer of 1944, however, production overtook maximum efficient productive capacity. Thereafter it was necessary, in order to meet war needs, to produce some of the best fields in the country above their maximum efficient rates.

U.S. crude oil production, producing wells, wells drilled and exploration holes drilled are shown in Tables I and II.

World Production During War.—World production, exclusive of the United States, the U.S.S.R. and the areas formerly controlled by the axis, increased by 41% from May 1941 to May 1945, compared to 29% for production in the United States.

"Some people have wondered why even more oil was not taken from foreign fields and less from home sources,"

Housewives in Iran scooping up oil for domestic use, at the Masjid-i-Sulaiman field. This field was so rich in oil that puddles such as this one were formed by seepage to the surface

Table I.—Crude Oil Production in the United States, and Number of Producing Oil Wells

Year	Yearly Totals (Barrels)	Daily Averages (Barrels)	Producing Oil Wells (End of Year)
1937	1,279,160,000	3,505,000	363,030

Deputy Petroleum Administrator Davies told the Special Senate Committee Investigating Petroleum Resources in 1946. "The reasons were purely physical and geographical and never in any sense nationalistic. Foreign fields carried as much of the war load as their productive and refinery capacity, available pipe-line outlets, and location with respect to points of need permitted. Our efforts to increase available foreign output received the wholehearted cooperation of the British and the nations in which the fields are located. At no time was there the slightest holding back of our allies, the slightest reluctance to develop or deplete fields that they control.

"In the early stages of the war the enemy, not our allies, forced disproportionate drafts on our domestic fields in comparison to those abroad. During the closing months of the war, however, the situation was reversed and our domestic fields could not meet even our own world-wide needs—the needs of our forces overseas and our essential domestic use. Our military, maritime and domestic consumption, not including lend-lease or other supplies to our allies and others, was greater than our domestic production. Without foreign oil and revenue lend-lease we should have fallen short, before V-J day; of meeting our own home and overseas requirements."

World oil production by countries 1937-44 is shown in Table III.

War Impact on Refining.—The war's impact on refining,

both in the United States and elsewhere, was as great as that on production. Refinery crude runs in the United States increased 31% from the average in 1941 to V-J day. Foreign runs increased twice as much—62%—in the same period.

With the help and supervision of PAW, nearly \$1,000,000,000 worth of new refining facilities were built in the United States, including great catalytic cracking units costing millions of dollars and smaller units in dozens of plants from coast to coast. These units turned out huge volumes of high-octane base stock and blending components for military and aviation gasoline, butadiene for synthetic rubber and toluene for explosives, and contributed heavily to the increased output of motor gasoline, kerosene and fuel oils. Roughly, \$260,000,000 was spent for similar refining facilities outside the United States. Except for a refinery in Saudi Arabia and two plants in the United States, the new facilities were incorporated into pre-existing plants.

Removal of Wartime Controls.—The Petroleum Administration for War was terminated on May 8, 1946, by the president's executive order of May 3. In liquidating this war agency and its emergency powers, the president indicated that it had successfully discharged its grave wartime responsibilities.

Commenting upon the action, Deputy Petroleum Administrator Davies said: "The undertaking, unparalleled in the annals of Government and industry, was carried to successful conclusion through the spirited cooperation and harmonious relationship that prevailed between Government and industry.

"All those who participated, on both sides, can rest in the knowledge that they contributed vitally to the defense of their country in its hour of peril."

Throughout the war, crude oil and petroleum product prices were virtually frozen at 1941 prices under OPA ceilings. Average annual prices of crude oil, gasoline and furnace oils 1937-45 inclusive are shown in Table IV.

Under the new price control law signed by President Truman on July 25, 1946, crude oil and all petroleum products were entirely free from price control, and future control depended upon future findings of the new Price Control board. The national average price of crude oil on June 30 of about \$1.33 per barrel, was increased 25 cents late in July 1946, and there was a general increase of slightly more than 1 cent a gallon in the gasoline retail price.

U.S. Oil Investment Abroad.—There was scarcely a country in the world where U.S. oil companies had not made investments directly or through subsidiaries or affiliates, according to the report of the Group on American Petroleum Interests in Foreign Countries to the Special Senate Committee Investigating Petroleum Resources. Although totally excluded with other foreign nationals from the U.S.S.R. and from participating in producing operations in certain other countries, they were represented in marketing activities in virtually all countries except the soviet union.

Of the total assets employed at the end of 1939 of nearly \$2,500,000,000, \$876,000,000, or 35%, was in exploration and production; nearly \$791,000,000, or 31%, in marketing; more than \$365,000,000, or 15%, in refining; about \$145,000,000, or 6%, in transportation; and \$322,000,000, or 13%, in "all others." U.S. petroleum investment abroad is shown in Table V.

Postwar Nationalization Trend.—The postwar trend toward complete national monopolies at the expense of foreign oil interests in many European and Latin-American countries was as pronounced if not more so than before World War II.

Substantial interests of the U.S., British and Dutch petroleum industries were located in European and far eastern theatres of war—in parts of the war-torn areas of Finland, Germany, Rumania, Austria, Hungary and Poland, and also in the Netherlands Indies. Some of these properties had been damaged or destroyed and were located in territories that either had experienced or might experience a change of sovereignty.

Prospects for restitution of losses in World War II were clouded by the political complexion of successor governments in both victor and vanquished countries, many of whom inclined toward nationalized economies. A further complication was the separate armistices concluded, terms of which, involving war-loss settlements, were being fulfilled in advance of a general peace treaty.

Russian Expansion.—Russian military victories gave the soviet union control of many central and southeastern European countries or parts of such countries. Some had petroleum production, and all had contained investments by U.S. and other foreign oil companies. Under the

guise of reparations paid for out of war booty, the U.S.S.R., making an interpretation of the Yalta, Moscow and Potsdam agreements not shared in by the United States and Britain, seized or placed under its own control considerable oil industry property in those countries. Also, by throwing up an iron barrier from the Baltic to Trieste on the Mediterranean, the soviet made direct bilateral trade agreements which seemed to exclude U.S., British, Dutch and French oil interests from an area of large markets in which they formerly operated. In certain of these countries, joint soviet and national oil companies were formed.

Included under soviet control were Rumania, Poland, Hungary and Austria, accounting for some 120,000 barrels of oil production daily—practically all the oil of Europe outside of the U.S.S.R. itself, except an insignificant amount produced in England, Italy and in the Hanover basin of Germany, under British control. Also within the U.S.S.R.'s "sphere" were most of the plants and raw materials of the large synthetic fuel industry developed by the Germans to an output level of about 100,000 barrels daily at the start of World War II. As noted, these plants were prime targets for Allied bombing raids and suffered considerable damage, but reports in 1946 indicated that the more important plants—at Blechhammer, in what was Polish territory, at Brux in Czechoslovakia and at Leuna in the Leipzig area—were being restored and represented a potential supply of from 20,000 to 25,000 barrels daily. Raw material for these plants was brown coal or lignite, the bulk of which was found in the eastern German, Polish, Czech and Hungarian basins in which the plants were located.

Early in 1946, the U.S.S.R. delayed withdrawing its military forces from Iran past treaty date, precipitating the first United Nations Security council test. The subsequent compromise reached, involving its agreed withdrawal, was to be followed by the formation of an Iranian-Russian oil company (in which the soviet union started with a 51% interest for the first 25 years) controlling a large area for oil exploration and development in northern Iran.

World Reserves.—World crude-oil reserves, excluding Russian, were estimated in 1946 at nearly 60,000,000,000 barrels, 4 times the reserves estimated in 1937, despite the greatly stimulated consumption during World War II. Estimated world oil reserves are shown in Table VI.

Large oil-promising sedimentary areas had been only partly explored or were still untouched. The potential-

Table VI.—Oil Reserve Estimates (In thousand barrels)

As of Jan. 1	United States	Outside United States	As of Jan. 1	United States	Outside United States
1937	13,063,400	11,727,218	1942	19,589,296	24,058,823
1938	15,507,268	14,278,582	1943	20,082,793	23,920,743
1939	17,348,146	21,822,424	1944	20,064,152	31,431,522
1940	18,483,012	21,801,986	1945	20,453,231	43,319,800
1941	19,024,515	22,440,983			

Sources: U.S. estimates are for "proved petroleum reserves" scientifically calculated by experts and published by the American Petroleum Institute. Foreign data are not as accurately or scientifically calculated, and are from best available private sources. Inasmuch as the U.S. and "Outside U.S." figures are not calculated on the same basis the annual calculation for "total world reserves" has been omitted. The information for 1944 is a combination of private information, PAW information, and the estimates submitted by E. DeGolyer after the visit of his mission to the near and middle east. For 1945 the data were taken from the paper presented by J. T. Duce at the hearings held before the Special Senate Committee Investigating Petroleum Resources. The latter estimate contains some reserves in the near and middle east that were classified by the DeGolyer mission as "indicated." The estimates from 1937 to 1943, therefore, are not comparable with those of 1944 and 1945. The figures for the earlier period are on a conservative basis because of the lack of complete data and, furthermore, do not include any "indicated" reserves. The principal differences in the estimates for 1943 and 1945 occur in Russia and the near and middle east as shown below (in million barrels):

Year	Russia	Near and Middle East	Others	Total Foreign
1943	2,392	12,503	9,026	23,921
1945	5,735	26,800	10,785	43,320

ties of future discoveries were illustrated by the fact that the United States, where it was believed more oil would still be found than had been consumed, had supplied two-thirds of the world's oil consumption through 1946 and yet contained only an estimated one-seventh of the world's sedimentary areas considered by geologists as promising for oil discovery. Peyrouton, Marcel

Peyrouton (1888–), French government official, was appointed secretary-general of the government of Algeria in 1930, resident-general of Tunisia in 1933 and resident-general of Morocco in 1936.

After service as ambassador to Argentina he was reappointed resident-general of Tunisia in June 1940, as France was about to surrender. He returned home after the armistice and by Sept. 1940 was Vichy interior minister.

After a bitter quarrel with Pierre Laval, Peyrouton resigned in Feb. 1941; he was then returned to Argentina as Vichy's ambassador, but when Laval returned to Pétain's favour, Peyrouton quit his post.

Gen Henri Giraud's appointment of Peyrouton on Jan. 19, 1943, as governor-general of Algeria was resented by De Gaullists, and Free French pressure forced him to resign on June 1, 1943. On Dec. 21, 1943, he was arrested and imprisoned on charges that he had suppressed French underground groups during his tenure as Vichy interior minister. On Oct. 9, 1944, he was transferred to a prison near Paris to await trial for treason.

Philadelphia

Like most older U.S. cities, Philadelphia, Pa., continued to show a decrease in its rate of population growth. The 1940 census gave the city's population as 1,931,334, 1% less than in 1930. On the other hand, population of the Philadelphia-Camden (eight-county) industrial area in 1940 was 3,199,600, 2% more than 1930, but the increase was less than previous decades. Families, however, increased rapidly; 13% in the eight-county area 1930 to 1940, and more rapidly after that year, causing an acute housing shortage.

Military establishments and war industries attracted many migrants; between 1940 and 1944 net migration into

Philadelphia was about 120,000, with an additional 100,000 entering the surrounding seven counties. Many became permanent residents.

The labour force expanded rapidly in the Philadelphia area to meet the emergency of World War II. From an estimated 1,062,000 in April 1940, the number of persons employed in manufacturing alone in the Philadelphia-Camden industrial area rose to about 720,000 during the peak in Nov. 1943. In July 1945 total employment in that area was about 1,220,000, of which 554,000 were in manufacturing. Reconversion produced no serious employment problem; although there was a slight drop immediately after the war, reconverted plants and the service establishments rapidly took up the slack. From an estimated 662,000 in April 1940 and 664,000 in July 1945, non-manufacturing employment in the area rose to about 750,000 in May 1946.

The diversity of Philadelphia's activities—particularly the balance between trade and industry and between manufacture of durable and non-durable goods—enabled the city to weather depression, war and reconversion with minimum disturbance. The ups and downs of one group of industries did not seriously disturb the economic status of the city as a whole. Of all types of manufacturing listed by the U.S. census, the Philadelphia-Camden industrial area had 351 types, or 85%. About two-thirds of its manufacturing personnel normally makes non-durable goods; such industries were less subject to cyclical disturbances than durable goods industries.

Philadelphia was a leading centre of war production; the total value of products in the city alone in 1943 was \$3,240,000,000. Wartime expansion of industries in the area was generally not of the spectacular type, but more stable. Increased production resulted from intensification of activity in prewar plants as well as new plants. Most of the modern spacious plants built for war remained in use; industries moved into them from more crowded older facilities during the postwar period.

The port of Philadelphia held its position as second U.S. port, but with noteworthy increase in tanker traffic, serving oil refineries along the Delaware and Schuylkill rivers. In 1939 tankers accounted for about 70% of tonnage, though general cargo remained important. In 1936 Philadelphia handled 6.78% of total U.S. port traffic; in 1941 exactly the same percentage. Submarine warfare and ship diversion reduced coastwise traffic, although foreign traffic held up. Philadelphia was the principal Atlantic port for wartime neutral shipping, handled large lend-lease shipments and was the major loading port for munitions.

Physical growth of the city and environs, retarded during the depression, was resumed in the prewar defense period, and accelerated during the war by industrial expansion. Termination of the war found Philadelphia with a tremendous housing shortage, and most nonresidential construction was deferred to divert critical materials.

The principal public non-war improvements completed between 1937 and 1946 included a subway extension and two municipal airports. Southwest airport handled scheduled air line operations, whereas Northeast airport became a mixed operations field. Plans were in preparation in 1946 for expansion of airport facilities, including modern terminals at both municipal fields and increase in area to 2,525 acres and 1,800 acres, respectively. The largest undeveloped area within the city was in the northeast, where the greatest proportion of postwar residential construction was under way.

During the decade Philadelphia had four mayors. Mayor S. Davis Wilson, elected in 1936, died Aug. 19, 1939, and was succeeded by George Connell as acting mayor. Robert E. Lamberton, elected in 1940, died Aug. 22, 1941. Bernard Samuel served as acting mayor until 1944, when he was elected for a four-year term.

The city's financial position improved greatly during the decade. Although the assessed valuation of real and personal property, of which the city's borrowing capacity remained a fixed percentage, declined from \$3,618,000,000 in 1936 to \$3,065,000,000 in 1945, payment of maturing bond issues carrying 4% to 5% interest, cessation of borrowing and refunding of loans at substantial savings in interest, gradually improved the situation. Another contributing factor was a tax on earned income, imposed in 1940 and amounting in 1945 to 25% of revenues. In 1945, for the first time in many years, the city had a free borrowing capacity of about \$18,000,000, and loans totalling \$17,000,000 were authorized, including \$8,000,000 for sewerage work. Additional borrowing capacity was obtained by imposing charges for sewer service, making the sewerage and sewage treatment works self-sustaining and the debt deductible in computing the debt chargeable against the legal debt limit. Since existing as well as proposed new sewer debt was deductible, general borrowing power of \$47,000,000 was acquired, and \$34,000,000 more could be borrowed specifically for sewerage work. An increase in the valuation of taxable property in 1946 advanced the city's general debt limit to \$317,000,000 against which debt totalling \$248,000,000 was chargeable, leaving a margin of \$69,000,000 for borrowing. Further loans totalling \$45,000,000 were authorized. These, with loans previously authorized and \$11,000,000 remaining from a waterworks loan, also deductible, enabled the city to finance a program of public improvements costing \$107,000,000, and have about \$24,000,000 of borrowing power left over.

A popular movement culminated in 1943 in organization of a new City Planning commission. Its staff analyzed population, economic and social trends to determine the character and extent of the city and region's development, and the need for public improvements, housing, transportation facilities, port development, recreational facilities and other features. Long-range plans were developed for future patterns of land use, housing, transportation and other aspects of the city and region's development, as well as for year-by-year needed public improvements. The latter were recommended annually for six years in advance after study of projects submitted by city departments and other official agencies, consideration being given to relation of each project to others, to need and to financial ability of the city, as well as to relation to long-range plans. Projects recommended for 1947-1952 included facilities for completely treating sewage and thereby eliminating pollution of the Delaware and Schuylkill rivers, several express highways, airport extensions, port improvements, a program of recreational facilities development and land purchase, major changes in the water supply including improved treatment and many other improvements. During World War II, large sums were made available for preparation of plans for projects to be carried out later.

Redevelopment and rehabilitation of blighted areas received impetus from the Redevelopment authority, created in 1945 and empowered to assemble land, using eminent domain where necessary, and to hold or dispose of the land in accordance with redevelopment plans approved by the Planning commission and carried out by

either public or private organizations.

Philately

The decade 1937-46 marked philately's "coming of age," so to speak, for during that period stamps for prepayment of postage and the collecting of such completed their first century. It was on May 1, 1840, that adhesive stamps were first sold, and five days later they were first used. Great Britain was the country that made the experiment. During the next few years, the idea spread to other countries.

The proposed Centenary exhibition was to have been held in London in 1940 but was cancelled permanently by World War II. Extensive plans were laid during 1946, however, for an exhibition in New York city of global character to celebrate in 1947 the centennial of the first U.S. issue on July 1, 1847.

Quantities of stamps, especially the irreplaceable classics, were destroyed during World War II. A surprising amount was saved, however, through the essential value and ease of transportation of the material. How much the outstanding rise in values—probably the greatest development in philately during the decade—owed to this loss could not be properly evaluated at the end of the period.

Another factor in the price increase was the great influx of new collectors, especially in those countries untouched by the physical ravages of war. It was noted in South Africa, in Latin America and, above all, in the United States. High income, limited consumer goods and the value of a hobby as a relaxation in tense times all contributed to this development.

"Stamps for the Wounded."—In the U.S., the interest displayed by soldiers in stamp collecting moved a number of interested philatelists to undertake visits to wounded soldiers in hospitals, with gifts of stamps and accessories. As the demand for such services grew, a movement was started in isolated areas to gather duplicate stamps and materials for such purposes. Charles Hahn, then editor of *Weekly Philatelic Gossip*, proposed that the two main societies of collectors in the United States, the American Philatelic society and the Society of Philatelic Americans, combine their efforts with those of these regional groups. In 1944, this was done, and "Stamps for the Wounded"—through the efforts of countless unheralded volunteers—visited the wards of all hospitals in the U.S. and supplied those interested with materials for collecting stamps.

Stamp Values.—Although there was no accepted stamp rule of value for comparing price trends, the normal market-research methods were as applicable to philatelic prices as to any other market. Furthermore, there was a measure of values in the various catalogues issued in the various countries.

Based on a sample of U.S. stamps, including none of the rarities and the preferred form (mint or used) of the issue considered, a comparison of values in the 1937 and 1946 issues of the *Scott's Standard Catalogue* showed that the values of the latter year averaged 175% of those of ten years previous. This analysis did not include airmail stamps, which will be considered separately. A similar comparison of the stamps of Great Britain showed a 1946 average value increase of 145%. In the British empire, average value increased 215%; in Latin America, 92.5%; in Europe (excepting Germany and Italy), 125%; in Italy, 94.5%.

These figures were not conclusive, however, for there had been a marked change in cataloguing practice—the

prices of 1946 were nearer the actual market price than those of 1937, when catalogues were just emerging from the "50% discount" mania (dealers selling at 50% discount from catalogue prices). Nevertheless, it was generally recognized that prices in 1946 were from one and one-half to two and one-half times those prevailing (on the same items) in 1937.

During the same period, a representative sample of airmail stamps showed a value increase of 138%. This was not true of all stamps, of course, nor of all countries. Because airmail stamps came into being mostly during the period when the trend to net prices was in vogue, the "discount" practice did not affect their value as it affected the value of nonairmail stamps. During 1946, prices on airmail stamps—with notable exceptions, of course—were close to one and one-half times 1937 prices. The notable exceptions were those which sky-rocketed in price and those which plummeted down.

Cataloguing.—Stamp catalogues are the bases of exchange and sale of stamps. In Great Britain and much of the empire, the catalogue most used is *Gibbons*. In France, it is that of *Yvert y Tellier*. Other geographical groups have their preferences, but by far the most used in the United States and Canada, as well as in many other countries, is *Scott's Standard Catalogue*.

When, in 1938, the publisher of *Scott's Standard Catalogue* became disassociated from dealing in stamps and became a publishing house, though retaining a nominal connection with the stamp-marketing organization, it was thought that Scott's—the oldest of all current catalogues—had reached a new niche in its field. During 1939–45, the unusual demand, heightened by the lack of imported catalogues, promised a new high in publication numbers; but paper rationing held it down to normal figures. In 1946, the catalogue was sold again—this time to a stamp auctioneer, who had previously served as an assistant to the editors in pricing the previous editions.

The 1946 catalogues, almost without exception, contained an increased number of listings over those in the 1937 issues. Scott's, e.g., was in two vols. containing about 750 and 1,000 pages respectively in 1946, whereas in 1937 the publication was in one vol. of less than 1,200 pages. Similar comparisons might be made of *Gibbons'* and of *Yvert's*.

War Issues.—World War II produced a number of peculiar issues. Chief among these were the occupation issues of axis countries. Laws of practically all warring nations forbade importing, even through neutrals, the stamps of enemy nations. Late in 1945, the *Scott Catalogue of Axis Issues* was distributed. This listed stamps known or believed to have been issued officially in the axis nations and in occupied countries (see accompanying table).

The stamps of Poland and Norway issued under German dominion should not be confused with other issues of the same period that were put out for the respective governments-in-exile for use on national warships and ships under the national flag with sea post offices on them. These were recognized as legitimate by the Universal Postal union.

When, in 1944, the Crown Colony of Falkland Islands issued seemingly unnecessary stamps for Graham Land, South Georgia, South Orkneys and South Shetlands—all dependencies of the Falklands—it was not with the view of selling stamps to collectors so much as it was an assertion of its claims to these almost uninhabited coaling and radio stations.

Philatelically speaking, there were also some retaliatory occupation issues. Each occupation zone of Germany issued stamps. During the actual fighting, while liberated terri-

tory was under Allied Military government, there were special A.M.G. issues, prepared in advance and usually printed in Washington, D.C., which served as the local accredited postage. As rapidly as possible in liberated zones, the normal civil functions, including postal arrangements, were returned to the responsible governments.

The Philippines, receiving full independence on schedule despite the Japanese invasion and occupation, heralded the day of independence (July 4, 1946) with a new issue proclaiming its status as an independent country.

One of the perquisites of sovereignty is the coining of moneys and the issuing of stamps. Reference *supra* to the Polish and Norwegian issues in exile gives this point, as it was a deliberate move to remind all nations of the existence of a legal government, even though exiled from native soil. The Universal Postal union, by accepting these stamps, made tacit acknowledgment to the world that these governments were the accredited *de jure* nations.

Propaganda Issues.—During World War II, many governments made use of postage stamps for advertising and propaganda. When the United States began to rearm (1941) before hostilities commenced, a series of three common values, one cent, two cent and three cent, stressed national defense. After the declarations of war, a three-cent value emphasized the slogan Win the War! (1942). China's long resistance to Japanese aggression was heralded with a stamp issue of the United States (1943). During that same year there were issues for the United Nations and the Four Freedoms and, finally, a series of stamps commemorating the overrun nations of the world. These stamps were of a five-cent value and each depicted the flag, in colours, of the nation honoured. Twelve of these (for Poland, Czechoslovakia, Norway, Luxembourg, the Netherlands, Belgium, France, Greece, Yugoslavia, Albania, Austria and Denmark) appeared in 1944 and one (Korea) in 1945.

Canada issued a series showing war production (1942–43); New Zealand, despite preoccupation with the war, commemorated the centenary of its settling (1940); Brazil called attention to its army in Europe (1945); Cuba and Costa Rica issued V for Victory stamps (1943); Australia commemorated its fighting forces (1940) as did many other nations.

There were, however, other uses of stamps for propaganda. Allowing them to leak out through Sweden, the Germans planted a series of Liquidation of the Empire

stamps for Great Britain. These were "issued" soon after D-day (June 6, 1944) and were forgeries of the current British stamps with the cross on the British crown replaced by the Star of David, and the d. (denoting pence) replaced by the hammer and sickle device. The various values were overprinted "Liquidation of the Empire" with the name of one of the colonies in which a base had been granted the United States or which had fallen to the Japanese. Other stamps let out included a parody of the Silver Jubilee stamps of 1935 with the head of Stalin replacing George V, and one of the coronation issue of 1937 with Stalin in place of Queen Elizabeth.

During 1946, it became known that the Allies forged stamps to be used by secret agents in Germany, to avoid the danger of going to post offices to buy postage for propaganda mailed in that country. This was a repetition of a practice started in 1915-17, during World War I.

Far more interesting, however, were several stamps ascribed to the Psychological Warfare services. During 1941, Italy had issued a series of stamps showing Hitler to the left facing Mussolini to the right and a legend *Due Popoli; Una Guerra* (two peoples, one war). The propaganda stamp, which reached Italy just before the collapse there, showed Hitler snarling, Mussolini cowering. The legend read: *Due Popoli; Un Fuehrer—Two Peoples; One Leader!*

Another, far more deadly, satire was the Himmler stamp of 1944, which replaced the head of Hitler with that of Himmler just at a time when the former was growing suspicious of the latter. Mailed, in Germany, to people who lost no time in showing it to the jittery leader, it was credited with helping undermine Himmler at a psychological moment.

Still another use of parody propaganda was the mailing of a flood of material in Germany with stamps that merely emphasized certain lines in the usual Hitler head so that it appeared, at first glance, to be a skeleton.

Literature.—At the Eleventh American Philatelic congress (1945), George E. Turner presented data to show that in the United States only 3.3% of the more than 2,400 stamp journals he had recorded had published more than 100 issues, and that only 37.5% of these were still extant.

Undeterred by this record of mortality, stamp journals continued to spring up in every country as paper became slightly easier to secure. The *London Philatelist*, completing its 55th year in 1946, was still on a reduced scale. On July 1, 1944, it dropped from monthly to bimonthly, partially because of lack of text (many philatelists having more urgent work than stamps in the war years) and partially because of paper shortages and the bombing of a printing plant.

None of the older journals of the United States changed status during the decade 1937-46, but in the latter part of 1946 a new weekly magazine, *Philately*, made its appearance. This brought to five the major weeklies published in the United States.

Two general books for general stamp collectors appeared in 1940. In England, L. N. and M. Williams wrote *Philately—an Outline of Its Elements*, while in the United States, *So You're Collecting Stamps!* by Mammel Hahn appeared. A revised edition of the latter also appeared in 1946. Stanley Ashbrook's monumental study of the *United States One-Cent Stamp of 1851-57* appeared in 1938. This two-volume set was extremely well illustrated and was awarded the Crawford medal of the Royal Philatelic Society of London. Another specialist study, *Les Emissions du Type Léopold*

II, 1883-93 by Paul de Smeth also was published in Brussels in 1938.

Outstanding Stamps.—In addition to the stamp issues previously mentioned, the decade 1937-46 produced many others worthy of remembrance.

In the United States, the year 1937 saw a set of five stamps for the army and a similar set for the navy. Each of the lower values showed two or three commanders of the armed forces and a view of a battle or a ship or fort. The highest value (five cents) of each set showed the service school—West Point for the army, Annapolis for the navy.

A complete new general issue appeared in 1938, from the one-half cent through the \$5 value. It was known as the presidential series, since each of the integral values portrayed a former president of the United States, in chronologic order. Living presidents were, by law, not so honoured. The one-half cent values showed: one-half cent, Benjamin Franklin, first colonial postmaster; one and one-half cent, Martha Washington; four and one-half cent, the White House.

In 1940, the United States issued several parallel sets of five stamps each, honouring native authors, poets, educators, scientists, composers, artists and inventors.

All the components of the British empire joined in two issues: the coronation of George VI in 1937 and a victory issue in 1946. Great Britain, breaking a rule of 100 years, issued a commemorative in 1940 on the occasion of the centenary of postage stamps. Several other countries also issued commemoratives for the centenary, among them Brazil, the Dominican Republic, Cuba, Paraguay, Portugal and El Salvador. In 1843, Brazil commemorated the centenary of its own first stamps, and Cuba likewise commemorated these as the first stamps issued in America. Also in 1943, Switzerland commemorated its own first centenary of Swiss stamps.

The 40th anniversary of the discovery of radium, for some reason, was commemorated not only by France but also by some other countries with stamp issues—among these Cuba and Afghanistan.

Not only did the United States commemorate the sesquicentennial of the ratification of the constitution in 1938, but many other governments did likewise. Guatemala issued a special sheet of four stamps, one of which portrayed Washington, another F. D. Roosevelt. The latter also appeared on a Brazilian stamp with Brazil's Pres. Vargas in 1940. Other nations issuing stamps for the U.S. constitution anniversary were Brazil, Panamá, Ecuador, the Dominican Republic, China, Turkey and El Salvador.

During 1939, the two world's fairs held in the United States—at New York city and at San Francisco—were saluted by a three-cent stamp in the United States. Other countries also commemorated one or both with longer series: Brazil, France and French colonies, the Dominican Republic, Iceland, Paraguay, the Portuguese colonies, Mexico, Rumania, U.S.S.R., the Netherlands, Poland and Czechoslovakia were among those saluting New York; El Salvador signalized the San Francisco fair; while Ecuador and Nicaragua issued series for both New York and San Francisco.

The 50th anniversary of the founding of the Pan American union fell in 1940. Despite the war raging in much of the world, many nations of the union issued one or more commemorative stamps, including the United States, Cuba, Honduras, Guatemala, Ecuador, the Dominican Republic and El Salvador.

Other Developments.—The efforts of philatelists for more than 50 years were crowned with success when con-

gress specifically permitted the illustration of all stamps, including those of the United States, in 1938. Limiting the illustration to black-and-white, the bill permitted illustration of United States stamps in three-quarters dimension or smaller or one and one-half times as large or larger.

The *Standard Catalogue*, after holding out for some time, finally admitted War and Defense Savings stamps of the United States to its listings. This action necessitated going back to World War I and including the Thrift stamps and War Savings stamps of 1917-18 and the succeeding few years.

The philatelic agency of the U.S. post office dept., offering stamps particularly for collectors, was augmented in 1942 by a revenue agency, purveying current stamps in collectible condition especially for collectors. The Philippine government continued its philatelic agency in Washington, D.C., and although constituted as an independent republic in 1946, continued to sell stamps to collectors. The Pan American union, with headquarters at Washington, D.C., maintained an agency selling stamps of the Latin American republics.

Philippines, Republic of the

The ten years between 1937 and 1946 were for the Philippines the great years of transition, crisis and realization. It was difficult to cite an analogous compression of events from the history of any other country.

Road to Freedom.—At the beginning of the decade, the Philippines had just become a commonwealth, a status provided under the terms of the Tydings-McDuffie act of the United States congress. By this act, signed by Pres. Franklin D. Roosevelt on March 24, 1934, a ten-year period of politico-economic transition was provided, to culminate on July 4, 1946 in a proclamation of independence, to be issued by the president of the United States.

On Nov. 15, 1935, Manuel L. Quezon, for so many years the leader of Philippine independence struggles, had taken his oath as first president of the Philippine commonwealth. He had been duly elected, along with Vice-President Sergio Osmeña, by democratic process, just as the constitution, duly drafted by popular convention, had been approved by popular plebiscite.

That constitution was modelled after the U.S. constitution, with some modifications. Amendments to the constitution could be adopted by submission to a national popular vote, but could only be proposed by a vote of three-fourths of both houses of the Philippine congress; a similar congressional vote could convene a constitutional convention to consider amendments which, in turn, had to be submitted to popular referendum. The original constitution provided a unicameral legislature and a single six-year term for the chief executive. Philippine experience with a unicameral legislature had been unsatisfactory; the constitution was amended in 1940 to provide for a bicameral legislature with the members of the senate to be elected at large for six-year terms. As in the United States,

one-third of the senators were to be elected every two years. The term of the chief executive was shortened to four years but he was made eligible for a single re-election. A chief executive could not succeed himself more than once, reflecting the desire to prevent, by all means, perpetuation of personal leadership.

Under the Philippine constitution, the chief executive was given sweeping executive powers and ample authority to manage and control the executive and administrative branch of the government, subject to the fiscal controls of congress. He could veto separate items of an appropriation bill, for example. The constitution, itself, provided that in national emergencies, congress might give the president comprehensive emergency authority, subject to congressional review. The president was likewise given an explicit mandate to promote social justice among the people. There were explicit and comprehensive safeguards of individual rights and liberties. The Bill of Rights, inserted as a basic portion of the Philippine constitution, was perhaps the most embracing and pervasive document of its kind. In the U.S. tradition and in the tradition of western liberty, the rights of the individual were safeguarded against all forms of government encroachment, but at the same time the central government was given full authority, subject to periodic review by the people, to deal vigorously with the social problems of the day.

A ten-year period of economic transition was envisioned under the terms of the Independence act. It was to be a period of preparation for independence itself. Virtually all powers over domestic affairs, except over currency, immigration, internal indebtedness and a few other matters, were vested in the commonwealth government. The sole U.S. official left in the Philippines was a high commissioner who had advisory and informational powers with respect to domestic matters, and represented the president of the United States in matters affecting foreign relations. Otherwise the government structure was in Philippine hands.

Staggering Economic Problem.—Thus the country started out on the road of transition to national freedom. It faced basic economic problems; the economy was tied to the U.S. free market; most of the chief export products—sugar, coconut oil, cigars, tobacco and cordage—depended upon U.S. tariff preferences, in order to be, on July 4, 1946, capable of unqualified economic independence. As a forcible "inducement" to adjust the economy, an export duty amounting to 5% of the U.S. tariff was to be applied, beginning in 1941, to exports to the United States, to increase by 5% annually until 1946. This export tax was to be applied to all Philippine products of a dutiable nature. The collections were to be earmarked by the Philippine government for the retirement of the government's bonded indebtedness. The Philippine government, moreover, was to be refunded the processing taxes collected in the United States on coconut oil and on sugar, thus providing a source of money for economic adjustment purposes.

The task of economic adjustment was tremendous. To revise the nation's entire economy in ten years was a problem to give pause to the most courageous. One-third of the government's ordinary revenues came from the sugar industry, an industry dependent entirely upon the U.S. market. One-half the national income depended upon exports to the United States, most of which were dutiable. The job facing the Philippines was to broaden and diversify the economy and to establish the machinery for transferring the nation's productive energies into fields independent of

Tragic remnant of the Bataan "death march," carrying their more exhausted comrades in makeshift litters as they neared Camp O'Donnell, Japanese internment camp on Luzon. Lt. Gen. Masaharu Homma, who ordered the march, was executed as a war criminal on April 3, 1946

U.S. tariff preferences. It was such a tremendous task that some Philippine leaders considered that the Independence act passed by the U.S. congress had ironic and ungenerous aspects, aspects which were ascribed to isolated selfish interests in the United States. But President Roosevelt, recognizing these aspects, gave public assurance after he signed the Independence act that "injustices and inequities would be remedied," if demonstrated in the operation of the act.

Because there were few available accumulations of free Filipino capital, the Philippine government was required to take the initiative in the vast economic adjustment program. A National Economic council was established. The National Development company, with great powers, together with a number of other government corporations, agencies and instrumentalities, were authorized and directed by the Philippine congress to deal with the problems on the broadest possible front. Among these agencies were the National Rice and Corn corporation, the National Tobacco corporation, the National Coconut corporation, the National Abaca and Other Fibres corporation, the National Land Settlement administration, the People's Homesite corporation, the National Power corporation, the Agricultural and Industrial bank and the National Food Products corporation. All of these were directed to institute such programs as would benefit producers and consumers, and help plan for the great transition. Money was made available in many cases from the refunds of the excise taxes collected in the United States. Some progress was made in instituting scientific methods in a few agricultural lines.

In order to carry out a large-scale program of developing industry and agriculture, it was necessary to "import" technical advisers, to send Filipinos to technical schools in the United States and elsewhere, to engage in a vast program of public education and to explore and establish new markets for the new products which were proposed to be developed.

There were many immediate questions crying for solu-

tion. Chief of these was the land problem. For centuries the main food-producing areas in the Philippines had been increasing in population, with the ownership of considerable areas concentrated in relatively few hands. Seasonal tenant farming, with all its incident evils, provided a never-ceasing source of social discontent. An obvious solution was a resettlement program. Between 1936 and 1940, numerous steps were taken, and some progress was made. Roads were built; new areas were opened up and water power sites were surveyed.

Despite all efforts, however, it was apparent that 1946 would find the economy grossly unprepared to meet the sharp impact which would result from being suddenly excluded, by reason of the tariff, from the United States market. The time was too short to make a complete transition.

In 1937, President Quezon reached an agreement with President Roosevelt for the establishment of a joint commission to study the problem. That commission became the Joint Preparatory Committee on Philippine Affairs, with six U.S. and six Filipino members, presided over by John V. MacMurray, former U.S. minister to Turkey. The committee held hearings in the Philippines and in the United States and conducted studies over a period of almost two years. Its report, presented in 1939, called for a 15-year period of postindependence adjustment running up to 1961, a period during which tariffs on Philippine goods would increase by 5% annually until they reached a total of 100%. For certain commodities, such as coconut oil, cigars, tobacco and embroidery—commodities which were not believed to be capable of withstanding the imposition of any tariff duty—declining duty-free quotas were recommended instead of progressive tariffs. That proposed program was submitted to the chief executives of both countries for their consideration.

On the basis of this report, legislation was submitted to the 76th congress of the United States. After many months of hearings and discussions, a bill, much amended, was signed and approved by President Roosevelt on Aug. 7, 1939. It consisted of a number of amendments to the original Independence act, substituting declining duty-free quotas for increasing tariffs for coconut oil, cordage, cigars, tobacco, embroideries, pearl buttons, but terminating effectiveness on July 4, 1946. Instead of extending tariff preferences beyond July 4, 1946, the United States congress deferred this issue by providing that not later than two years before independence, an economic committee would be set up, including three members of the U.S. house and three members of the U.S. senate, and a like number of appointees by the president of the Philippines, to study the postindependence economic relations between the two countries. Although it was growing late, no decision was yet made.

Economic and Social Democracy.—The progress in economic adjustment has already been discussed. The steps taken were not alone to provide a national economy independent of the United States; the measures were set in a framework of free, progressive democracy whose objective was social and economic justice for all. Numerous measures enacted during the first years of the commonwealth were directed toward this end. One of them was an eight-hour labour law. A national benefit insurance system for all government employees was created. Government charity clinics and child-care centres were established in practically every town throughout the nation. Minimum-wage levels were established for labourers in both government and private enterprise. Comprehensive workmen's compensation legislation was enacted.

The government laid down a program of adult educa-

tion schools, not only in the centres of population but also in the distant barrios. Community assemblies for the dissemination of news and information were encouraged in villages which could not be reached by newspapers. Primary schools were established in the remotest areas. The services of social welfare agencies were made available to the poorer classes. Provincial hospitals and public dispensaries were set up throughout the land.

To meet the urgent problem of farm tenancy and landlessness, the government initiated plans—plans which were interrupted by World War II—to acquire large landed estates in Luzon. The aim was to subdivide these estates into small lots for distribution to tenants and occupants. Many of these estates belonged to the Catholic Church, whose officials in many cases proved willing to co-operate with the government program.

Ambitious farm projects were also launched. The National Land Settlement administration established farm colonies in Koronadal Valley in Mindanao and in Malig settlement in Isabela. Plans were laid to initiate a number of such projects; credit facilities and other aids were provided. Vast areas of the rich and fertile island of Mindanao, areas already part of the national domain, were set aside for development in this manner.

In the slum districts of Manila, the National Homesite corporation built tenement houses to be rented to workers at low cost. A model workers' settlement was laid out by the government in Baguio where houses were built for labourers and other low-salaried employees.

In order to insure protection of the interests of the workers, a court of industrial relations was created to decide labour and industrial disputes. Provision was made for compulsory arbitration of strikes and lock-outs. Because the Philippines had a largely agricultural economy,

Maj. Gen. Edward P. King, Jr., last U.S. commander on Bataan in 1942, as he waited with his aide at Lamoo in April to discuss terms of surrender with the Japanese

labour was not organized to any considerable extent, but legal protection was given to such labour unions as existed.

The tax structure was codified and revitalized. Increased taxes on luxuries, amusements, mine profits, gifts, inheritances and income were imposed. The principle of taxation on the basis of ability to pay was firmly implanted in the new tax system.

Some social measures have already been described. There was a concerted effort, led by the administration, to establish social equality, especially equality of opportunity for the young. Government scholarships and special educational aids in vocational, agricultural and professional fields were made available. The entire government program was designed to impress upon the people the fact that the government desired and intended to make progress toward full social justice, although such progress had to be measured in terms of available resources and finances.

Political and Judicial Democracy.—On the political front, democratic practices were encouraged and promoted. Although the administration party, the Nacionalista party, had an overwhelming majority, and although the fight for independence had tended to encourage political unity, every protection was given to minority groups, who were represented in the legislature, in the City council of Manila and by mayors in various outlying cities. Just prior to the 1935 national election, a deep split in the Nacionalista party, which occurred because of conflicting views over independence legislation in the United States, had been healed. Sergio Osmeña, leader of the opposition to Quezon, was nominated and elected Vice-President. This was later to allow Osmeña, a venerated political leader in the Philippines, to become president upon Quezon's death in 1944.

An independent judiciary of unimpeachable integrity had been one of the fundamental innovations of U.S. rule. Under the commonwealth, the role of the judiciary was further emphasized and exalted. The supreme court, with jurisdiction and status very similar to those of the United States supreme court, was further enhanced in prestige and authority. Its personnel was carefully selected from the most eminent of the nation's jurists and personages. An innovation during the commonwealth period was the establishment of a court of appeals, along U.S. lines, to share the burden of appellate jurisdiction with the supreme court, whose superior jurisdiction, however, was unquestioned. Another innovation was the creation of the Office of Public Defender, composed of lawyers whose function was to defend, without charge, the rights of labourers and small farmers in court litigation.

Question of National Defense.—Although the United States had primary responsibility for the defense of the Philippines during the commonwealth period, President Quezon, recognizing that in 1946 the responsibility would be suddenly shifted to the new Philippine republic, made as his first recommendation to the first session of the commonwealth legislature in 1936, a proposal for the establishment of an office of national defense. General Douglas MacArthur, who had just completed a term of office as chief of staff of the United States army and who had been commander of the Philippine department of the United States army, was engaged as military adviser and head of the United States Military mission to the Philippines.

General MacArthur served in that capacity for five years, leaving it in the summer of 1941 to become commanding

One of the floats in a parade held in Manila during the visit of Premier Hideki Tojo to the Philippines in 1943. Pictures of these events, obtained through neutral sources, were the first photographs from the Philippines to reach the United States after the Japanese occupation in 1942

general of the United States army forces in the far east. It was in that post that General MacArthur was destined to carve for himself an immortal niche in the military history of the far east.

The first move to implement the Philippine national defense was the creation of a citizens' army through a constitutionally-sanctioned system of universal military training. An annual appropriation of 16,000,000 pesos was approved to support and maintain a regular army of 930 officers and 10,000 men and a reserve force of not less than 400,000 men, the latter total to be reached by 1946. A 250-plane air corps and a small naval patrol to consist of 100 fast torpedo boats, were projected.

Under the training program, approximately 20,000 youths were given basic military training annually, serving for a period of five and a half months. Because of shortages of equipment, the training necessarily was rudimentary; but as inadequate as it was, that training was to bear rich fruits in years soon to come.

World War II.—Although Japan had been in the process of aggrandizing its territory and economic authority in the far east for a number of years, there was little fear of imminent danger to the Philippines until after the outbreak of war in Europe in 1939. With the downfall of France and the commitment made by the United States to the victory of the Allies in 1940, there were increasing apprehensions in the Philippines that a conflict in Asia was inevitable. It had long been contemplated that Philippine security could be provided by neutralization, a guarantee of Philippine integrity by all the Asiatic powers. Such a neutralization proposal had been written into the Philippine Independence act, calling upon the United States to initiate the neutralization move.

Japan, however, was continuing unchecked in its expansionist ways. The war party took unabashed leadership of the Japanese government. In the Philippines, apprehensions turned to convictions. Faith in neutralization was dissipated.

In the early hours of Dec. 8, 1941 (Manila time), the radio carried word that Pearl Harbor had been bombed. Philippine officialdom was galvanized into action. The Philippine army had already been mustered on July 20, 1941, into the service of the United States armed forces. The withdrawal of U.S. marines from China in the late fall of 1941 made the Philippines the farthest Pacific outpost of U.S. military power. The U.S.-Philippine forces consisted of approximately 100,000 ill-equipped Filipino reserves, 5,000 Filipino regulars with little combat experience, 12,000 Filipino scouts, who were part of the United States army, approximately 10,000 U.S. army troops, including many reserves, a small air force and two regiments of marines. With this hastily improvised "army," General MacArthur undertook the defense of the Philippines. The U.S. naval forces in the vicinity consisted of the so-called Asiatic fleet: a converted cruiser-flagship, a sea-plane tender, several ancient cruisers and a number of destroyers, none of which was fitted out with modern anti-aircraft equipment, anti-aircraft fire control, radar or the other essentials of modern naval warfare. A squadron of ancient sea-plane bombers and a few new motor torpedo boats completed the force.

The Japanese struck by air in the early afternoon of Dec. 8. They landed in the Philippines on Dec. 9. The Filipino people, as a whole, responded with a single will, to resist, to fight off the invader and to drive him into the sea. General MacArthur did not even ask for the declaration of martial law. It was deemed unnecessary. But the defenders were outmatched. It was estimated that 200,000 crack Japanese troops participated in the initial landing. Quickly overrunning the beaches of Aparri and Lingayen, and in southern Luzon at Batangas, the Japanese swept down upon Manila, which was declared an open city on Dec. 24. What remained of the U.S. and Filipino forces withdrew into Bataan peninsula in accordance with preconceived plans. There General MacArthur waged the historic campaign associated with his name. Meanwhile, the naval forces, after inflicting maximum damage upon the Japanese, withdrew to bases in the East Indies, where most of the ships of that gallant little squadron went to their death.

On Feb. 20, a month and a half before the fall of Bataan, President Quezon, Vice-President Osmeña, U.S. High Commissioner Francis B. Sayre and a few members of their staffs were evacuated by submarine from Corregidor, President Quezon to the relative safety of the southern islands and High Commissioner Sayre to Honolulu. On March 11, General Douglas MacArthur was withdrawn to Australia on orders of President Roosevelt, to continue his gallant fight.

On April 9, 1942, the U.S.-Philippine forces on Bataan surrendered. On May 6, 1942, the remaining forces on Corregidor (*q.v.*) under Lt. Gen. Jonathan M. Wainwright, surrendered. (See WORLD WAR II.)

Simultaneously with his surrender, the U.S. and Filipino forces stationed in other islands of the Philippines were directed by General Wainwright to surrender as a condition precedent to the acceptance by the Japanese of the surrender of Corregidor. Some of the forces, notably in Mindanao, held out for a time. Many U.S. and Filipino soldiers as individuals and in some cases en masse fled to the hills rather than surrender. The bulk of Filipino

troops were concentrated in stockades; the U.S. troops in separate stockades. The Japanese began at once a policy which they figured would woo the Filipinos from their allegiance to the United States and to western democracy.

On leaving the Philippines, President Quezon had left his executive secretary, Jorge B. Vargas, in charge of civil affairs. Upon the occupation of Manila, the Japanese set up an Executive Commission under Vargas' chairmanship to take over civil administration. The Japanese had a single program in mind, namely, to obtain from the Filipinos the maximum amount of assistance for the Japanese war effort, and to include the Philippines in the so-called "Greater East Asia Co-Prosperity Sphere." A policy of pacification was to be carried out, permitting the stationing of a minimum number of Japanese combat troops in the islands.

In all of these objectives, the Japanese met from the beginning intense opposition. Japanese efforts to enlist the Filipinos on the Japanese side under the banner of coloured races *versus* white failed completely. From passive resistance, the Filipinos proceeded to active resistance. Isolated guerrilla bands became guerrilla armies. The more the Japanese looted, stole, oppressed, punished and tyrannized, the more the Filipino people resisted, rebelled and fought against their masters. Not a single island in the Philippines was without its resistance movement. By the middle of 1944, guerrilla forces controlled more than 60% of the actual territory of the Philippines.

The Japanese did their best to "Japanize" the islands. Instruction in English was discouraged; teaching of the Japanese language was made compulsory. School enrolment dropped to a fraction of its prewar proportions. The attempt to eliminate English as a common language was doomed to failure; even the Japanese had no alternative but to speak English to the Filipinos. Textbooks were purged of all references to the U.S. and Britain, and of the words "freedom" and "democracy." Radio sets were "reconditioned" to prevent reception of short-wave broadcasts from abroad. Heavy penalties were meted out for the "crime" of listening to short-wave broadcasts from the U.S. An airtight censorship was placed upon newspapers and other publications. The only available information concerning the war was that disclosed by the Japanese high command through the Japanese news agencies. An ambitious over-all program to "rejuvenate" Philippine culture was initiated, with a corps of university professors imported from Japan.

Political parties were dissolved to give way to one party, the "Kalibapi." The entire economy was taken in hand by the Japanese military in an effort to convert it to Japanese military needs.

In Oct. 1943, an elaborate pageant was held in Manila; "independence" was granted to the Philippines. The constitution of the puppet republic, drafted by Filipino leaders under the watchful eyes of the Japanese, was still a far cry from the Japanese model. It maintained the tripartite division between the judiciary, legislative and executive functions and even persisted in many Anglo-Saxon and western political practices. The entire "independence" was, of course, a rude joke; the Japanese had no intention of permitting the Filipinos to be anything but puppets of the Japanese military. Formal relations between Japan and the new "government" were largely ceremonial, since the real power continued to be held by the Japanese military command.

The Japanese were anxiously insistent upon placing in

General Douglas MacArthur personally led the return to Leyte Island in the Philippines on Oct. 20, 1944

positions of responsible leadership in the puppet government individuals who could be depended upon to command the respect of the Filipino people. Great pressure was brought to bear upon those leaders who were unwilling to lend themselves to this cause. The pressure consisted of threats, of retribution and even of death and torture. But the Japanese failed completely in their principal purpose. Although they succeeded in ruining the Philippine economy, they did not succeed in gaining much from it for their own uses.

President Quezon, Vice-President Osmeña and selected members of the cabinet meanwhile had established a government-in-exile abroad.

A hazardous and exciting submarine and torpedo-boat race with the Japanese had gotten the presidential party out of Corregidor. From a rendezvous in one of the southern islands, a plane had taken them to Australia. After remaining at General MacArthur's headquarters for a brief period, it was decided that the Philippine government could best function in Washington. On May 8, 1942, President Quezon and his party arrived at San Francisco. A special train sent by President Roosevelt took them to Washington where they received a triumphant welcome at Union station by President Roosevelt himself.

The government was established and a war cabinet was formed. The special emergency powers which had been voted the president in 1940 now served to enable the government to function constitutionally without a legislature.

Through General MacArthur's headquarters, President Quezon maintained contact with the forces of resistance and presided in civil affairs over the increasing area of the Philippines under the control of the resistance groups. The printing of so-called guerrilla currency was authorized. Provincial treasurers and other officials in the "free areas" were appointed. A "shadow government" under the very noses of the frustrated Japanese, functioned for all practical purposes. These areas, of course, were largely in the southern and central islands where Japanese military control was peripheral.

In recognition of the heroic Filipino attitude, President Roosevelt arrived at a decision to invite the Philippine government-in-exile to become a member of the United Nations. The Philippine commonwealth became the 28th signatory of the United Nations charter. When the United Nations Relief and Rehabilitation administration was formed, the Philippines signed as an adherent. A Pacific War council, established to co-ordinate the struggle against Japan, extended membership to the Philippine commonwealth along with Britain, China, Canada, the Netherlands, France, Australia and New Zealand. The Philippines participated in all the international conferences which were held during this period.

In 1943, the United States congress passed a special resolution authorizing President Quezon to continue in office until a successor could be duly elected. Congress felt that Quezon's leadership in the war effort was essential; and that until constitutional processes of free election could be re-established, he should continue in office despite the prohibition against service for more than eight years.

MacArthur's Promised Return.—As U.S. naval forces under Adm. Chester Nimitz and the land and sea forces under General MacArthur moved inexorably against Japanese strongholds in the Pacific, hopes rose high. The promised day was in the offing. Submarine and air contact was established with the U.S. forces, and supplies, munitions, food and money began to pour into the Philippines.

On Aug. 1, 1944, the Japanese radio carried the report that President Manuel Quezon had died in the United States. The news came as a tragic shock to the Filipino people. At first there was disbelief, since the Japanese had announced Quezon's death early in 1942, attributing it to tortures by the Americans. Short-wave broadcast from San Francisco, however, confirmed the sorrowful news.

In Washington, Osmeña succeeded Quezon, and pledged himself to follow all his predecessor's policies.

When United States troops landed on the island of Leyte, 200 miles south of Manila, on Oct. 20, 1944, guerrilla troops were ready to help clear the way. Many areas were captured from the Japanese before the U.S. troops reached them. Guerrilla regiments were thrust en masse into the fighting U.S. armies.

The U.S. forces received 300,000 recruits overnight, most of them seasoned soldiers and veterans of three years of jungle combat.

Immediately following the first wave of troops at Leyte, President Osmeña, side by side with General MacArthur, waded through the surf to plant the flag of the Philippines on Philippine soil. Tacloban, provincial capital of Leyte, was established as the temporary capital of the Philippine commonwealth.

Four months later, on Feb. 27, 1945, the commonwealth government was installed in Malacañan palace, Manila. Shortly thereafter, the Philippines were declared "liberated" and the reins of government were transferred to the Filipino officials. The remaining combat areas were successively reduced. Everywhere the Japanese fled before the conquering Filipino-U.S. armies. Japanese occupation forces, estimated at 300,000, who had four years in which to entrench themselves, were overcome in a matter of months. But the desperate fighting and the unbelievable and vengeful sacking of huge areas by the Japanese had left the Philippines a pitiful shambles.

Ruins of War.—In every large city, in hundreds of smaller municipalities and even in barrios, most of the habitable dwellings were destroyed; schools had been sacked and gutted; bridges over the principal rivers and waterways blown up; telephone and telegraph lines disrupted, radio stations dismantled and all the government buildings, with but isolated exceptions, in ruins. Transportation between the several islands and within the islands was similarly paralyzed. All the interisland vessels were sunk or taken away by the Japanese. No commercial aircraft remained. Street cars and busses were destroyed or stolen. Railroads were bombed into uselessness and most of the rolling stock gone. Factories, mills and plants everywhere were demolished. Most of the precious work animals, the carabaos, were eaten or killed. Farm lands were left fallow and untended.

Physical war damage was estimated, in prewar values, at 1,000,000,000 pesos out of a total prewar assessed value for all the Philippines of 2,250,000,000 pesos. In addition to this total of physical damage and the economic damage already cited, there were thousands of wounded and disabled, hundreds of thousands of families uprooted and dispersed and hundreds of thousands of breadwinners killed, maimed or missing. This was what the country inherited from war. This was the problem faced by the just-returned government, newly installed in the homeland.

The job of reconstruction and rehabilitation, however, had to be, for the moment, subordinated to the use of the Philippines as an invasion base for the anticipated onslaught against Japan. At one time, there were nearly 1,000,000 troops stationed in the Philippines. The dislocation of the national economy increased; the carefully laid plans made in Washington for the rehabilitation of the country, of its finances and currency, went completely awry. With all shipping concentrated on bringing war supplies to the Philippines, with hundreds of thousands of U.S. troops receiving millions of dollars in pay in Philippine pesos, inflation soon became extravagantly accentuated. Currency, which had been astronomical in terms of Japanese occupation "mickey mouse" money (about 3,000,000,000 pesos, all of which was declared invalid upon

liberation) became astronomical in terms of good U.S. dollars and the dollar-based Philippine pesos. Rice, the basic commodity of the Philippines, stood at more than ten times its prewar value. Other prices rose to corresponding levels.

In addition, there was the monumental problem of dealing with those who had held civil posts under the Japanese, the so-called collaborationists, whose disposition agitated the people and deeply concerned the officials of the United States government.

Painful Reconstruction.—This multiplicity of problems was sufficient to stagger the imagination of ordinary men. But they were not all. The Philippines, in the fall of 1945, faced the early imminence of the political independence that was scheduled to come on July 4, 1946, just a few months away. Independence itself would bring tremendous economic and political problems and changes.

During the occupation, the office of the United States high commissioner, last held by Francis B. Sayre, had been left unfilled. In Aug. 1945, President Harry S. Truman appointed Sayre's predecessor, Paul V. McNutt, as high commissioner for a second time. Upon McNutt's recommendation, President Truman, on Oct. 25, 1945, issued a series of 14 executive orders, laying down the civil policies

Filipino guerrillas and U.S. rangers who raided Cabanatuan prison in a daring rescue of 513 prisoners of war on Jan. 30, 1945. Most of the prisoners were survivors of Corregidor and the infamous Bataan "death march"

to be followed and calling for a number of studies and investigations of problems arising from the liberation of the islands. In line with one of these orders, the United States congress served notice that a general election should be held in the Philippines not later than April 30, 1946. The Philippine congress voted to set the date at April 23 and to name at that time a new president, vice-president and new members of the house of representatives and two-thirds of the senate.

Next, the United States congress took up the long-delayed matter of postindependence trade relations with the Philippines. In recognition of the fact that the Filipino people had proved themselves a heroic ally in war, the United States congress enacted a series of measures which, in the opinion of congress, rewarded Filipino valour. The first such measure, enacted with the support of President Truman, was the Bell act, which provided for 28 years of preferential trade relations with the Philippines after independence—eight years of free trade and 20 years of gradually increasing tariff duties and declining duty-free quotas, the latter in the case of coconut oil, cigars, tobacco and cordage.

In order to induce U.S. capital to venture into the Philippines after independence to help repair the ravaged country, congress required the Philippines to guarantee non-discrimination against Americans in the development of natural resources and in the operation of public utilities. The U.S. congress also required that for the 28-year period, the Philippine peso should remain pegged to the U.S. dollar. The tariff arrangements were to be reciprocal, in that U.S. products were to be admitted into the Philippines on the same basis as Philippine products into the United States.

The Philippines were granted a 28-year preference of two cents per pound on the processing of coconut oil in the United States, and were assured of quotas of sugar, coconut oil and cordage in the U.S. market for the same period.

The United States congress enacted at the same time a companion rehabilitation measure, a War Damage act. This authorized the award of \$620,000,000 in war damages to the residents of the Philippines and to the Philippine

government: \$400,000,000 for payment to private individuals, with an established priority for small claims of \$500 or less; a public works program of \$120,000,000 for the rehabilitation of public buildings and facilities and \$100,000,000 worth of surplus property which was to be turned over to the Philippine government. In addition, a considerable training program for Filipinos in technical fields, such as aerology, meteorology, road building, harbour engineering and fishing was also provided.

Meanwhile the national election was held. President Osmeña, the incumbent, was the candidate of the conservative wing of the Nacionalista party. Manuel Roxas, then president of the senate, was the candidate of the opposition forces in the same party. This group, dissatisfied with the conservatism of the administration, formally organized the liberal wing of the Nacionalista party and nominated a full slate of candidates. The campaign was very sharp, and the lines were clearly drawn.

Between what came to be known as the Liberal party and the Nacionalista party, the chief issue was conservatism *versus* progressivism, with a number of ideological cross-currents. The Liberal party won a resounding victory, electing its candidate for president by 200,000 votes and a majority of the seats in the house of representatives and the senate (66 out of the 98 house seats, and 9 seats in the senate out of the 16 seats which were up for election). These results gave the Liberal party a working majority in Congress and possession of the national administrative machinery.

Roxas President.—The inauguration of the new president took place on May 28, three days after the new congress convened. In his first message to congress, President Roxas recommended a heavy program of legislative action, including (1) restoration of law and order through peaceful but firm measures; (2) an agrarian reform program, starting with the purchase of landed estate for distribution to tenants and an increase in the percentage of the crop to be distributed to tenants (70–30); (3) sweeping reorganization of the government machinery to eliminate waste, inefficiency and duplication; (4) a public works program; (5) a G.I. Bill of Rights for Filipino veterans and (6) establishment of credit facilities for economic rehabilitation. The president recommended, moreover, that the trade agreement with the United States be approved and that the Philippines maintain the closest possible relations with the United States.

Economic relations with the United States became a sharp and critical issue during these months. A section of the Manila press undertook a bitter campaign against the trade arrangements with the U.S., and against the United States generally. The Philippine congress, however, overwhelmingly voted to grant the President authority to sign the Executive Trade agreement.

On the morning of July 4, 1946, on the 170th anniversary of the birth of the U.S. nation, the Philippine commonwealth became the Republic of the Philippines. A historic ceremony was held on the Luneta, the plaza where the Filipino hero, José Rizal, met his death at the hands of a Spanish firing squad 50 years before. Representatives of 30 foreign governments looked on, as Paul V. McNutt, newly designated ambassador to the Philippine republic, read, on behalf of the president of the United States, the Proclamation of Philippine Independence.

To carry out the new nation's foreign policy, a department of foreign affairs was organized. Elpidio Quirino, Vice-President of the Philippines, was appointed secretary of foreign affairs. The first Philippine Embassy was established in Washington, D.C., with Joaquin M. Elizalde as

Philoff, Bogdan Dimitrov

Philoff (1883–1945), Bulgarian statesman and archaeologist, was born April 10, 1883, in Stara Zagora, Bulgaria. He studied at the universities of Leipzig, Bonn and Freiburg in Germany and soon won a reputation as an authority on archaeology. Appointed conservator of the National museum in Sofia in 1906, he was promoted to director in 1910.

In Nov. 1938, Philoff was made minister of public instruction in the cabinet of Prime Minister George Kios-

The Philippine flag of red, white, blue and gold is shown being raised over Manila as the U.S. flag was being lowered, during the ceremonies marking the beginning of Philippine independence on July 4, 1946

first ambassador.

Thus the new republic was launched, in the midst of economic difficulties of staggering proportions. A land destroyed by war was brought forth upon the world scene as a new nation. In any other time in history, such a prospect would have been impossible. (See also GUERRILLA WARFARE; JAPAN; WORLD WAR II.) (M. ROX.)

seivanoff. Following the latter's resignation in Feb. 1940, Philoff was made prime minister. During the early part of his tenure of office, he merely followed orders given by King Boris, who exercised dictatorial authority in governing Bulgaria. Thus, he dutifully followed the king's orders to act as middleman in arranging for the entry of German "experts" and "technicians" into Bulgaria in March 1941. While he professed an "unalterable" love for peace, he signed the axis pact on March 1, 1941. Subsequently, German troops in Bulgaria launched an offensive against Yugoslavia and Greece. After the death of King Boris (Aug. 28, 1943), Philoff, Prince Cyril and Gen. Nikolai Mikhov formed a three-man regency council to rule in the name of the boy king, Simeon II. Later Philoff resigned as prime minister. After Bulgaria's surrender to the Allies, Philoff was arrested (Sept. 21, 1944) and turned over to the soviet authorities. Tried for treason by a Bulgarian court at Sofia, Philoff, Prince Cyril and Gen. Mikhov were sentenced to death. Philoff was executed Feb. 1, 1945.

Philosophy

It would be fruitless to claim ten years of progress for the philosophy of the decade 1937-46, or even ten years of consistent stability. Whether it be the philosophy found in books or the more significant philosophy in the behaviour of people and in institutional tendencies, the decade, philosophically, was scattering and miscellaneous. Philosophy, like other expressions of the culture of the age, clearly was not at one with itself. As an aggregate it was heterogeneous, pluralistic, a sound of many voices saying different things.

This does not mean that some of those voices were not significant. Nor does it mean that uniformity among philosophies and philosophers is necessarily desirable. Block philosophy, without inner variegation, is more than likely the rationalization of an authoritarian dogma. Philosophical expression as an aggregate, however, lacked not only organizational unity but inner homogeneity as well during the decade. It revealed therein the basic cultural conflict and disorganization of the western world. Culturally it revealed not one world but many fragments, each with its universal pretensions. This disorganization became violently articulate in World War II. The outcome of that war, at least so far as the intellectual symbolization of experience was concerned, showed more rather than less disorder than before.

Nor were the opposing philosophies of this decade of conflict aligned strictly with the physical contestants. No one side had any one philosophy, although each side tried vigorously to force its mismatched doctrines into the same bed. Nevertheless, certain points of view emerged which seemed to characterize the decade and its conflicts. One was the ascendancy of a secular universal order and authority implemented by modern technology. This order was cosmic in range and inflexible in character. Though called the mass state, it really was the totalitarian or completely organized state. In reference to it human variations, values, choices were deemed invalid. The human personality as such was repudiated and the human being was reduced to one or more functional, specialized instruments which alone justified his participation in the state. As an array of functional, impersonal fragments he was absorbed

wholly into the state with no margin of significance beyond. This fragmentation of the human being into functional specializations was of course characteristic of mass organization everywhere, and no doubt was the source of most of the ideological conflict both internal and external of the dominant social groups. The so-called totalitarian states, however, overrode the protests of the philosophical humanists and carried the thesis to a logical but not necessary conclusion. Their point of view was based on a conception of science—a limited one—that had gained authority through the astonishing developments of modern technology and mechanism. Technological statism, an omnipotent statism, is a fairly descriptive term for it. (See COMMUNISM; FASCISM; NATIONAL SOCIALISM.)

In contrast to this point of view, and usually in conflict with it, was humanism. It too was often secular, though not always. It placed first value, not on the total organization of society, but on the integrated or whole human being participating by virtue of his essential human nature in a community of other human beings. Though this wholeness can be realized, of course, only through participation in the community, it is participation not as functional fragments of life but as a whole person. It would be an oversimplification no doubt to say that the decade was focussed in the struggle for survival of the human being and the human community against the disintegrative forces of technological, mass organization. Such a statement, however, would have a greater degree of truth than would be comfortable for western, humanistic philosophers to contemplate.

Authoritarian and Humanist Wings of Philosophy.—Philosophically this conflict was expressed by many writers. Of these the authoritarians were the frankest in stating their side of it. The mass of writing and preaching that flourished through part or all of the decade in Italy, Germany, Japan, Russia was given little scholarly attention by philosophers of Anglo-Saxon persuasion. They were nevertheless important, not for their imaginative or creative luminosity, but because they made massively articulate an authoritarian ideology, a philosophy of unmitigated power and concussion, that many liberal thinkers of the accepted academic tradition had naively assumed was long ago dead and gone.

These power philosophies of modern technological statism were for the most part violent restatements of the classics of their particular tradition. Hitler's *Mein Kampf* came to its climax of attention in the decade. The conscious virilities of Mussolini's balcony speeches, the eager pugnacities of Hideki Tojo and Isoroku Yamamoto, the Marxian reverberations in Russia, all were implicit with the philosophy of an emergent totalitarian culture and way of life. Though these philosophies were departmentalized according to national groups and differed markedly from each other, with the German deeply mystical, the Russian rationalistic and materialistic, the Japanese traditional and tribal, they were alike in being rigidly authoritarian, with the massive, overwhelming, technological state as the be-all and end-all of human endeavour.

In contrast to the authoritarians, the humanist philosophers as a group seemed diffused, unorganized and somewhat vaporous. No doubt they were indeed all of these things, for lack of explicitness and unity seems to be an occupational disease of theirs. It became evident, however, as the decade came to an end, that for all their lack of immediate, dynamic explicitness, they referred to implicit depths of human potentiality, to great unseen reserves of human value and power that resulted, at least for the time being, in ideological and physical triumph.

George Santayana at work in the Convent of the Blue Nuns, Rome, Italy. For his metaphysical writings in *Realms of Being* (Scribner's, 1942), Santayana was given the Nicholas Murray Butler gold medal for 1945, an award based on distinguished contributions in the fields of philosophy and education

Most of the philosophical writing of the decade of U.S., English, French or Scandinavian background was related in some way to this humanist point of view. So also was some of the German, Italian and Spanish writing until it was blacked out by war and totalitarianism. These various groups in the humane tradition may be listed tentatively as follows: The pragmatic-instrumentalist group that followed, in contrast to the totalitarians, the great liberal branch of the stream of science; the mystical group, religious and personally exploratory; the semanticists and logical positivists analyzing meaning; some mathematicians; the formal, more traditional humanists; the phenomenologists; the extremist fringe, such as the existentialists. To these may be added the agrarian distributists, sometimes called integralists, a group not much represented in formal philosophy, but important in their protest against mass operations and ideologies.

The Pragmatists.—The first of these humanist groups, variously called the pragmatists, humanists and instrumentalists, led by John Dewey, carried on the tradition that William James and C. S. Pierce had begun 40 years before. This highly significant modern philosophy was developed from one of two great streams of scientific thinking. From that aspect of science which is liberal and humanistic it arose in sharp contrast to the totalitarian ideologies which had been nourished so effectively on the other kind of scientific thinking, namely, mechanistic technology and authoritarianism. The difference was striking and fatal. It well may have been due to the fact that the humanists, unlike the authoritarians, had been willing to extend the concept of scientific experimentation broadly into the field of human values and life. Science to the humanist is a way to solve problems, a method of finding the humanly successful way which is truth. It is by no means limited

to the problems of material and power, but provides a way, says the humanist, to criticize these power objectives and to transmute them into harmonious parts of the general social order and good will. Dewey's books, *The Theory of Valuations* and *The Theory of Inquiry*, appeared during the decade. The volume on Dewey in the *Library of Living Philosophers*, edited by Paul Arthur Schilpp, brought together much of the more pertinent current criticism of this point of view.

The pragmatism and experimentalism of James and Dewey, though derived largely from science, had in its turn a reverberatory effect on many scientific thinkers. The atomic scientists, bomb makers, were in many cases evidently affected in their social and moral valuations by this philosophy. Though clearly lost, confused and innocently confounded when confronted by the sudden devastating consequences of their scientific technology, they struggled, futilely to be sure, but with the greatest of human good will, to criticize and control what they had brought forth. In many other fields, such as in the effort to unify science, scientists showed that they themselves, or at least their leaders, were closer to the liberal side of science than to the authoritarian. The many years, however, in which science had developed without benefit of philosophical thinking, began to exact their price. Whether science as an entire complex of operations could be liberalized or humanized remained doubtful.

The Mystics.—The mystical philosophy of the decade 1937–46 had several centres quite unrelated to each other. The translation of a large part of Søren Kierkegaard's work gave to many English readers their first access to the tense, mystical, fluttering thought of the Danish master. This significant influence very soon was carried outside of academic circles. The poet Wystan Auden and other literary men were caught in the spell, and migrant intellects, rebounding in some cases from the once fashionable literary communism, turned to it. It was influential even in such boulevard philosophies as existentialism.

At about the same time *The Gospel of Ramakrishna* was translated by Swami Nikhilananda; Aldous Huxley, Gerald Heard, the Quaker, and others were convening with Indian teachers and yogi in California, and Indic mysticism, far less disturbed, far more a quietude of thought than was Kierkegaard's, received a good deal of attention. Aldous Huxley's interpretive anthology of mystical writings, *The Perennial Philosophy*, and Sheldon Cheney's *Men Who Have Walked With God* helped to confirm this interest. Beyond all this a certain familiar mysticism in the comings and goings of life reasserted itself. For all the ascendancy of science, the world was less secure and less stable than before science captured the leading role. Mysticism was not inappropriate at such a time.

Semanticists.—The semantic movement that had begun outside of the circle of professional philosophers with books by Alfred H. Korzybski and C. K. Ogden and Ivor A. Richards in the early 1920s was one of the accepted problem areas in philosophy a decade later. The work of Ludwig Wittgenstein, the logical positivism of Rudolph Carnap and numerous papers in *The International Encyclopaedia of Unified Science* gave the semanticists philosophical authority, and what was in Ogden and Richards a limited analysis of the process of symbolization or word meaning became in the decade 1937–46 a philosophy with metaphysical implications (or rather an anti-metaphysical metaphysics). Like the pragmatists, experimentalists and early positivists, the new logical positivists rejected metaphysics

in that they were word references for which there were no observable referents. Just as the philosophical idealists before them had felt it necessary to analyze experience because all that we know is in experience, so the semanticists found that it behooved them to analyze the process of symbolization and verbal meaning because words after all surround and embody all our philosophical thinking. They were in general radically nominalistic. (See also SEMANTICS.)

The Mathematicians.—It is hardly justifiable perhaps to cite a philosophical group because its members are mathematicians. Modern philosophy like modern science is unusually endowed with mathematicians, however, and the tendency towards pure abstraction as over against the radical empiricism of a James or Dewey gives its own character to philosophical interpretation. It too is a kind of language with its own semantic codes. The more philosophical mathematicians of the decade, such as Bertrand Russell, A. N. Whitehead, Albert Einstein, were never captured by their own techniques, but the mathematical tendency to interpret the significant matters of the universe in terms of the abstract preciosities of pure quantities and numbers nevertheless continued apace. This was particularly true of some scientists when confronted by philosophical problems beyond the reach of their methodology.

Formal Humanists.—All the philosophies of the more liberal wing of modern thinking may be justly called humanistic. A group more formally humanistic than these may be set apart. It is a group loosely joined by a classical interest in the pre-scientific concept of human nature—the human being, namely, as an association of soul and body, of spirit and flesh, of matter and essence, of psyche, sensorium, intellect, emotion, animal faith or other faculties and components of the aggregative whole. In this group may be placed—mutually protesting perhaps—such different men as George Santayana, Jacques Maritain, R. M. Hutchins, Mortimer Adler and possibly Ernst Cassirer. Though Neo-Thomists, such as Adler, may have been frankly authoritarian, and though Santayana was no doubt more concerned in the aesthetic or appreciative aspects of experience than in love of human beings, their primary interest in the human epic and problem rather than in the philosophies of power, matter and cosmic technology placed them in the humanist group. Santayana's *Realm of the Spirit*, and the volume on Santayana in *The Library of Living Philosophers*, edited by Schilpp, were published during the decade. So also was Santayana's interesting analysis of the Gospels, *The Idea of Christ in the Gospels*. In *The Nature and Destiny of Man*, the social liberal and modernist, Reinhold Niebuhr, presented a surprisingly conventional doctrine of sin and salvation. In *An Essay on Man*, the post-Kantian philosopher, Ernst Cassirer, developed his theory of culture, in which he repudiated the naturalist's exclusive emphasis on science. He held that science is but one mode or structure of order among many others. These include language, myth, religion, art.

Phenomenologists.—New among the philosophic groups in the U.S. and England were the phenomenologists. With the translation of some of the work of the post-Kantian Edmund Husserl, the publication of a collection of essays in his memory edited by Marvin Farber, the foundation of the journal of *Philosophy and Phenomenological Research*, the publication of *The Foundation of Phenomenology* by Marvin Farber, and *The Philosophy of Edmund Husserl* by E. P. Welch, the movement was fairly launched.

Fritz Kaufmann and Felix Kaufmann were other members of the group.

Integralists.—A group which began with social criticism and moved to religious, moral and philosophical interpretation was variously called decentralist, distributist, agrarian or integralist. It was represented by the Catholic Englishmen, Hilaire Belloc and G. K. Chesterton, as well as many who were not Catholic. In the U.S. it was represented by an important social and religious movement within the Catholic church and to a lesser degree in the Protestant churches. Outside of the churches men so diverse as O. E. Baker of the U.S. department of agriculture, Frank Lloyd Wright, Ralph Borsodi, Baker Brownell, Henry Ford, Arthur E. Morgan, Howard Odum and the southern agrarians participated in it. From the moral and religious point of view the group held that the integrated human being is the final objective of social and educational endeavour and that the integration of human life is possible only in the true community. Modern mass industry, mass populations and centralized power destroy the true community and cause the disintegration of human values and life. A distributive economy and technology, a true community life and a natural and usually agrarian environment were considered necessary to human integrity and stabilization. Borsodi attempted to systematize and unify the field. Much religious thinking, including that of Aldous Huxley in *Ends and Means* and other works, turned in this direction. The movement had not matured philosophically by the end of the decade but represented a widespread, implicit protest against the cosmopolitan ideology of the period.

* * *

THE NINTH international Congress of Philosophy in Paris in 1937 set up six groups of problems for discussion. They were: (1) Cartesian studies; (2) the unity and methods of science; (3) logic and mathematics; (4) casuality in physics and biology; (5) reflective analysis and transcendence; (6) value and reality. In the following decade, the course of philosophy was at least to a considerable extent among those problems. The primary division in philosophy was and probably would continue to be between two interpretations of science: totalitarian authority and liberal humanism. The decade ended in general fear and anxiety, under the threat of the most recent instruments of science and technology, literally in the shadow of death. (See also LIBERALISM.)

The bibliography that follows documents this major philosophical conflict. It presents in addition some technically philosophical works of importance.

Phosphates

Active fighting in northern Africa during World War II greatly reduced phosphate rock outputs in areas that normally had produced nearly 40% of the world output.

The year of maximum effect fell in different years in the different countries, and the minimum year and the percentage decline from the 1937 level were as follows: Egypt, 1941, 78%; French Morocco, 1942, 52%; Tunisia, 1943, 81%; and Algeria, 1943, 88%. By 1944, the output from French Morocco had recovered to 96% of the 1937 level, but the other three averaged only 36%. Including these declines, the loss of some of the island deposits to Japan and cuts in the U.S. exports, phosphate supplies outside the United States were seriously reduced.

Phosphate rock production in the United States during the war years was stimulated by the increasing demand for fertilizers to sustain the food supply. In 1945, at the end of the war, the demand for food supplies became even greater, with the necessity for relief shipments, bringing a record phosphate output in that year.

Between increasing output and declining exports, the available domestic supply increased each year beginning in 1938. In the postwar period, exports were expected to reach their former level or possibly even higher, but until agriculture in the war-torn countries could be more fully rehabilitated, it was more practical to use the phosphate to raise bigger U.S. crops, for shipment where they might be needed.

(G. A. Ro.)

Photography

During the decade 1937-46, photography forged ahead with important new developments, largely in technical applications and discoveries. New sensitized products, colour processes, optics, cameras and lighting materials were the result. More than half this ten-year period was devoted to a world war with photography put to its severest test. If the best of these war developments in photography could be put to constructive peacetime use, there would be some compensation for such a period of conflict.

War Photography.—Thousands of photographers scattered over the entire globe covered the greatest photographic assignment of all time—World War II. These cameramen followed all the military campaigns on land and sea and in the air. They covered the early aerial reconnaissance work when the Allied nations were frantically preparing their defenses and also carrying out their bombing missions. The aerial photographers were making over 20,000,000 photographs each month toward the end of the war. In addition to the mapping and aerial intelligence, photography was used for photographing enemy troop concentrations, spotting targets for bombers and studying the effects of bombing and shellfire and the effectiveness of camouflage.

Still and motion picture photographers covered the historic conferences at Casablanca, Tehran, Yalta and at Potsdam after the German surrender. Millions of photographs were made during the African and European invasions. From the Pacific came the photographs of the bombings and invasion of Luzon, Iwo Jima, Okinawa and the bombing of the Japanese cities. Then, in Aug. 1945, the photographers recorded the devastating atomic bomb explosions

over Hiroshima and Nagasaki. Finally, on Sept. 2, 1945, the Japanese representatives signed the surrender terms on board the U.S.S. "Missouri" in Tokyo bay, and the world's greatest war photographic coverage had come to a close.

Aerial night photography was developed by the use of flash bombs timed to explode at desired distances below the plane and in such a position that the flash was just out of the field of view of the camera. Photoelectric devices, operated by the flash, were used to open or close the camera shutter. Aerial reconnaissance work was perfected to the point where photo interpreters could often determine what an enemy plant was manufacturing by studying the colour of the smoke coming from the chimneys or the colour of the refuse piles and by-products in factory yards.

The Fairchild Camera and Instrument corporation developed the Intervalometer, a device which automatically operated the aerial camera shutter at predetermined intervals ranging from 1 to 120 seconds. The production of such pictures improved the quality of aerial photographs and also made it easier for photo reconnaissance experts to assemble the hundreds of aerial pictures making up the photomontage maps used by military commanders. There was also a thermostat-control electric heater designed to keep the equipment at uniform temperatures during high-altitude flights.

Hundreds of training films were produced during the war to accelerate the training of soldiers for every branch of the military forces. These film production centres were located in Canada, England and the United States. Most of the training films for the U.S. armed forces were produced by the air force, the navy and the U.S. signal corps. Still photographs and slide films were also used extensively in the training programs. These productions were usually made on standard 35-mm. motion picture film; after final editing, 16-mm. prints were made for distribution to the various training centres. Most of these pictures were black-and-white sound films.

The Canadian National Research council together with the Fairchild Camera and Instrument corporation developed a high-speed ophthalmic camera for the Royal Canadian air force to photograph pilots' eyes to determine vitamin deficiencies. The resulting photographs showed the conjunctival blood vessels of the eye in sharp detail.

One of the most effective military and commercial instruments was the special camera designed for use in photographing radar images. The continuous radar images permitted military planes to travel over enemy territory

Remarkably clear in details, this photograph was taken from a single-seater U.S. army reconnaissance plane flying 310 m.p.h. at an altitude of 150 ft. The film unrolls past a slit in the shutterless camera at a rate which varies with the speed and altitude of the plane

at night or through heavy clouds and find their mark without ever seeing the ground with the naked eye. This product was known as the Fairchild automatic radar recording camera, and consisted of five units: camera, magazine, beamsplitter, adapter casting and control box. The complete camera installation was tied in with the radar circuit, and the camera itself mounted on top of the radar's oscilloscope. The unit was so arranged that the operator could observe the luminous picture of the terrain on the radar scope, while simultaneously the camera photographed it for continuous, permanent record.

A shutterless continuous-strip aerial camera was another important development. This camera made a continuous picture as the film passed across a narrow slit at a speed which was synchronized with the image which passed below the lens. The camera took 200 ft. of film at one loading. One continuous negative could be made or short lengths of the film strip exposed as required. Colour film or black-and-white film was used. The main use for this continuous-strip camera was in aerial reconnaissance work.

U.S. Army Pictorial Service.—U.S. combat photographers followed the progress of World War II so closely that their pictures appeared on the front pages of home-town newspapers within 24 hours. These men who fought with film

instead of bullets were responsible for keeping up civilian morale and at the same time contributing to total war coverage in pictures for training soldiers, accelerating campaign plans and for recording materials and equipment in action. Mathew B. Brady, the great pioneer in combat photography with his magnificent coverage of the American civil war, made his photographs on cumbersome glass plates, slow emulsions and with a bulky camera which required a tripod. In contrast to Brady the combat photographer of World War II was equipped with miniature cameras as well as the 4X5 Speed Graphic type. He had extremely fast films, infrared films for special night photography with infrared flash and also the use of small flash lamps which carried a light impact greater than sunlight.

The army pictorial service was formed with the major task of getting the message of military techniques to the millions of troops being trained in all branches of the service. Photographs were produced for identification, military and public information, historical record, V-mail and for all types of microphotography of documents, maps and similar material. The U.S. army pictorial service was part of the signal corps. At the close of the war, it had nearly 500,000 selected negatives in its files, culled from nearly 4,000,000 pictures made by the army and other services. Over 14,000,000 ft. of combat and production footage were in its film library. The V-mail units photographed over 1,000,000,000 letters. The war department used photography for five main purposes: documentation and historical record, news dissemination, technical study, strategic and tactical planning and training. It was the responsibility of the army pictorial service to fulfil these photographic demands.

After peace was declared, the army pictorial service started editing and compiling the complete chronology of the war from the millions of feet of motion picture films. Over 500,000 ft. of edited silent film together with narration and animation sequences was to be in this project.

During the war, the production of training films was only part of the photographic coverage. Photographers followed every landing operation and continued through the daily fighting. For example, in the Luzon invasion the army had 14 combat assignment units, 2 newsreel assignment units, 2 mobile laboratories and a photo repair section. Two other signal corps combat assignment units were with the navy. The total personnel consisted of 22 officers and 88 enlisted men in this photographic assignment alone. The three essentials for adequate photographic coverage were good equipment, personnel and full information.

The average combat unit included one officer, two still photographers, two motion picture men and a utility man. The newsreel units had one officer and nine men. Wide-angle lenses were commonly used for combat photography. Some of the Speed Graphic cameras were equipped with 10-inch long focus lenses.

Colour photography was not used very extensively for actual combat work. However, it was used a great deal back of the lines, for aerial reconnaissance, publicity and special training. The first colour photograph to be transmitted by radiotelephoto to the United States and published in some newspapers within 24 hours was that of the "Big Three" at Potsdam.

U.S. Navy Photography.—The photographic division of the bureau of aeronautics became the main production centre for most of the U.S. navy's photographic requirements. Like the army pictorial service, the navy started reviewing and cataloguing the thousands of feet of combat film which arrived daily from all theatres of operation

during World War II. Aerial reconnaissance was the most important part of naval photography. However, a huge training film program was also carried on at the same time. Some idea of the production of these films could be gained from the fact that within $3\frac{1}{2}$ years more than 1,100 navy training motion pictures, averaging 2 reels each, were produced. During this same period, more than 2,200 slide films were made to supplement the training program.

In order to facilitate the exchange of training film information and the distribution of training films themselves among the armed services of the United Nations, the United Nations Central Training Film committee was formed in 1942. The committee held regular meetings at The National Archives in Washington. Up to the end of the war, over 7,000,000 ft. of motion pictures produced for training were received and filed. During the same period over 3,800 slide films were received. The training films included almost 800 subjects from the British army and the R.A.F.

Important colour films were produced by the navy. Subjects included naval operations, training films, gun camera records, combat reports and historical records. Both 16-mm. and 35-mm. colour films were used to make the hundreds of training films. The live-action shots were made with 16-mm. colour, while the 35-mm. colour film was used for the majority of animation subjects. The bureau of medicine and surgery produced more colour films than any other bureau in the navy. The bureau of ordnance used colour slide films very successfully for instruction in the operation of complex gun mechanisms and wiring diagrams. The bureau of personnel replaced lengthy lectures by using colour motion pictures to train inductees in various skills. The psychiatrist used audio-visual aids successfully in the preparation of the background of emotional and mental health. By means of the motion picture, skilled physicians could present their message to large audiences and thus greatly aid the small corps of psychiatrists.

Out of all this accelerated photographic development for war and destructive purposes there was promise of a new development in the use of audio-visual aids for peacetime education and entertainment. The men who made

The Kodak Ektra, a 35-mm. precision camera first shown in 1940, usable interchangeably for black and white or colour film, with a compensating built-in view finder, a left-handed film advance lever and an anti-reflection f/2 50-mm. lens

these military training films began to use their valuable training for the production of new visual films in a changed world.

Sensitized Materials.—The basic recording material in photography remained the sensitized emulsion, mounted on a glass, film or paper base. Because of its importance, the sensitized emulsion was the focal point of intensive research during the decade 1937–46. Photographers were continually asking for faster films, finer grained emulsions and various colour-sensitive emulsions. With sensitizing dyes added to the photographic emulsion during manufacture, it became possible to have “tailor made” emulsions for almost every photographic purpose.

Until 1930, the use of sensitized dyes in emulsions had been quite limited. However, as the result of important research in the United States, England, France, Germany and the discovery of hundreds of new dyes, the modern emulsions could be sensitized selectively in all parts of the visible spectrum and also to the invisible infrared and ultraviolet portions. The panchromatic emulsion, sensitive to all colours, in its various forms became the standard emulsion in the professional fields. Amateur photographers were also quick to see the advantages of increased speed and colour sensitiveness in these new films. The former orthochromatic era of photography definitely changed to the panchromatic era.

The demand for increased emulsion speed continued in spite of the tremendous advances during the decade. As the speed of films increased new photographic uses developed. The news photographer could secure photographs in weak natural light where flash lamps were forbidden. The X-ray technician could obtain superior diagnostic results with less exposure and thus a saving in the life of the X-ray tube. The motion picture industry became dependent upon the new fast films.

Along with increased speed there was a demand for finer grained emulsions. Sound recording and microphotography developed tremendously with the new fine-grained emulsions which were unknown prior to 1936. The miniature camera flourished with the finer grained emulsions as well as the increase in speed.

During the early 1930s, the production of faster panchromatic films caused the grain of the emulsion to be coarser. This was not desired for small negatives which required enlargement because of the resulting loss in quality of the image. To overcome this drawback in the fast films, there was widespread use of fine grained developers which were extensively used up to about 1939. At that time, many of the developers used the toxic paraphenylenediamine as one of the chemicals. Another drawback was the loss in speed which resulted when films were developed in most of these fine-grained solutions. Finally photographers began to realize that they could get just as good, if not better, results by using the slower emulsions which insured excellent fine-grained results. Later improvements in fast films gave the amateur and professional photographer some of the finest emulsions ever produced. Better colour sensitivity, keeping qualities, finer grain and increased speed were now taken for granted in the modern emulsions.

It is interesting to note that in 1875 the photographer could only record one-third of the visible spectrum, while in 1946 he could photograph more than four times as much as he could actually see. By using the newly discovered sensitized dyes, the new emulsions were capable of photographing the invisible infrared and ultraviolet regions. This development extended the seeing range of the astron-

omer and the spectroscopist as well as the microscopist. Medical and industrial research also benefited.

A summary of the film developments by the Eastman Kodak company during the ten-year period from 1936 to 1946 is typical of the important advances in this field.

- 1936. Eastman Panchro Press film and Ortho Press plates were produced for the press photography field where unfavourable lighting conditions were met. Eastman also introduced 8-mm. Kodachrome as well as Kodachrome, Type A.
- 1937. Three new 35-mm. motion picture film emulsions were placed on the market; Fine Grain Sound Recording film, and negative and positive Fine Grain Duplicating films.
- 1938. As a result of significant advances in the technique of emulsion making, it was possible to bring out new films having high sensitivity and low grain. Three of these were Panatomic X, Plus X and Super-XX for the professional motion picture field. The new fast sheet films were Super Panchro Press, Super Ortho Press and Super-XX Panchromatic. The Kodalith group of films and papers were brought out for the graphic arts field.
- 1939. Tri-X and Ortho-X films were introduced, representing a very important advance in film speeds.
- 1940. Matte transfer films, for transferring drawings photographically to metal or plywood, came just in time for the accelerated war production period.
- 1941. Tri-X Aero Panchromatic film for night photography was the fastest emulsion then available. Kodacolor Aero Reversal film for aerial photography in colour and for processing in the field by the user.
- 1942. Kodacolor roll film and Kodacolor prints—a negative-positive colour process for use in amateur roll film cameras. Unlike Kodachrome, the colour-forming couplers are included in the film and paper coatings.
- 1943. Kodacolor Aero Reversal Film was announced publicly. Previously it had been used for military purposes.
- 1944. A neutral density integral mask was introduced into Kodacolor negative film to give improved quality in the final colour prints. Super Panchro Press Sports type was produced with about twice the speed of the previous types of extra-fast films used in press photography.
- 1945. Laboratory tests showed that the speed of infrared film could be increased many times.
- 1946. Ektachrome film announced. This colour film can be processed by the photographer.

As new requirements developed in all the important fields, the photographic manufacturers produced special emulsions. Some of these groups included: (1) industrial photography, (2) press photography, (3) X-ray, (4) photolithography, (5) sound recording and the duplication of motion picture negatives and (6) scientific photography. The cellulose film support was greatly improved in quality during the decade. The acetate film base was taking the place of the former nitrate support for much of the sheet and roll film. Along with these improvements, the modern films were free from abrasion, fog and halation.

Colour Photography.—The phenomenal development of colour photography for the amateur and professional during the decade was largely due to the introduction of Kodachrome in 1935. This was a monopack colour film based on the subtractive process, invented by Leopold D. Mannes and Leopold Godowsky, Jr. and developed by the Eastman Kodak company. Kodachrome film is composed of three separate emulsions on one side of the film base, with gelatin layers between each emulsion. The three emulsions respond to red, green and blue light. By placing a yellow dye between the top emulsion and the lower two emulsions, blue light is held back and reacts only on the top layer. When the Kodachrome film is exposed in the camera the blue, green and red light is recorded upon the different layers according to the sensitivity of each to the three primary colours.

As processed in 1946, the three exposed layers were de-

veloped to positives and then by the reversal process converted to the final full colour positive representative of the original subject. Yellow, magenta and cyan dyes formed the final colour positive. The colours of these dyes were thus complementary to the blue, green and red light which was originally recorded on the three separate layers of the film. As these layers of colour were so thin and close, the final full-colour image looked like one emulsion.

The positive colours were created by the use of coupler development. This method was based on the fact that when a developer reacts to silver bromide to create a silver image, oxidation takes place which in turn reacts with selected chemicals to form dyes. Thus the final images were made up of the coupler and the dye.

After the first development of Kodachrome to obtain the negative silver images in the three different layers, a red light is used to expose through the base of the film. As a result, the unexposed silver bromide areas in the bottom layer react to the red light and when placed in a coupler developer a positive blue-green or cyan image is produced. The other two layers are not affected by this processing because they are only sensitive to the blue and green light. In the next step, the top, or blue sensitive layer of the film is exposed to blue light followed by coupler development to make the yellow image. This leaves the middle undeveloped layer between the top yellow positive and the lower cyan positive. A magenta coupler is then used for developing the middle layer to complete the three colour positives which include the dye and also the silver. The silver is then removed by a bleach bath and the film is fixed, washed and dried. The final result is a beautiful colour image composed entirely of insoluble dyes and without the silver grains.

Kodachrome was first introduced in the 16-mm. size for ciné photography. In 1936, the 8-mm. size became available and the amateur home movie field received a tremendous increase in popularity with the new colour film. During the next two years this colour emulsion was made available on sheet films up to 11x14 in. in size. In 1939, the Eastman Color Temperature Meter was introduced to enable the photographer to evaluate the colour quality of

The Graphic 45, a combat camera released in 1944, was specially designed to resist dust and water

his studio lights. The Harrison Light Corrector became available for a similar purpose a few years later. The Eastman Kodak company's Hall of Color at the New York world's fair fired the imaginations of thousands of visitors. Colour photographs were at last available to every photographer for still and motion picture photography. A new era of colour was at hand.

By 1941, Kodak Minicolor prints were being made from miniature Kodachrome transparencies. Kotavachrome professional prints from Kodachrome sheet transparencies were also made available. As World War II accelerated in intensity, Kodacolor Aero Reversal film for aerial photography in colour and for processing in the field by the user was ready for military use. This was the fastest colour film available with a speed of Weston 32. This film had a fairly high contrast to overcome the flattening effect of aerial haze. A special emulsion was also available for making duplicate transparencies from the colour originals. These duplicates had a diffusing support to permit direct viewing by transmitted light.

Kodacolor roll film and Kodacolor prints, a negative-positive colour process for use in amateur roll film cameras, appeared in 1942. Unlike Kodachrome, the colour-forming couplers were included in the Kodacolor film and paper coatings. This film is first exposed in the camera and then developed to a colour negative followed by printing onto paper to produce the final colour positive. In the Kodacolor negative the colours are reversed or complementary to the original colours in the subject. The same type of coating is used on the paper prints. When the colour negative is exposed on the print the final colours are produced similar to the colour in the original subject. In 1944, a neutral density integral mask was introduced into Kodacolor negative film to improve the quality in the final colour prints.

Soon after the introduction of Kodachrome in the United States, the new Agfacolor was announced in Germany. This new multilayer colour film was available for miniature cameras and amateur motion pictures. Agfacolor differed from Kodachrome in that the colour forming components were incorporated in the layers at the time of manufacture. In Kodachrome processing, the colours are added one at a time to each layer. Agfacolor could also be developed as a complementary negative from which direct colour prints were made. This film could be processed by the user.

Each emulsion layer of Agfacolor contained colourless dye-coupling components forming the yellow, magenta and cyan colours in the different layers when the film is developed. Ordinarily negative silver images were formed during the first development. The film was then exposed to white light which reacted on all the undeveloped silver halides in the layers to make the positive images. The colour-forming developer of the paraphenylenediamine type produced the positive silver image. During this process, the colourless dye components already in the film combined with the reaction products of the colour developer to produce the yellow, magenta and cyan colour images in each layer. At this stage the film contained both the negative silver image and the positive dye image. A potassium ferricyanide reducing solution was then used to remove all the metallic silver from the different layers and left where the original emulsion was blue-sensitive, a magenta dye image in the centre green-sensitive layer, and a cyan image in the red-sensitive layer next to the film base.

Anso Color film was developed in the United States by Anso and made available for military and government use in 1942. This integral tripack type of colour film was based

The Kodak Medalist, a roll-film camera placed on the market in 1941, took $2\frac{1}{4} \times 3\frac{1}{4}$ in. pictures and featured many of the characteristics of the miniature camera. The improved Medalist II, shown above, was introduced in 1946 with a built-in flash shutter

on the same process of manufacture as the Agfacolor film made in Germany. It was the first colour film which could be processed by the user without the need of special equipment. The following year Anso Color was available for essential war industries, and by 1945 it was in use by amateur and professional photographers. This new colour film could be processed by the photographer in his own darkroom.

Ektachrome film was announced by Kodak on Aug. 26, 1946. This new colour film had soft gradation and brilliance in rendering excellent reproductions of the original subjects. However, the main feature of the new Ektachrome film was that the photographer could do his own processing of the film after exposure. This feature was important for news, syndicate, commercial and illustrative photographers, who could have finished colour pictures within a few hours. A newspaper could now have its colour pictures ready for use within ten hours from the time the original exposure was made. The developers used for processing Ektachrome did not have a toxic effect on the skin, as did some of the other colour finishing processes. The exposure factor for Ektachrome Daylight Type film was the same as for Professional Kodachrome.

Colour Prints.—Colour printing on paper was largely done by the Carbro and wash-off relief processes for commercial photography. The Autotype company in England was furnishing the tissues used in Carbro printing. Later the Devin firm and others in the United States produced these materials. Chromatone was a colour printing process introduced by the Defender Photo Supply company, but this was later discontinued. Kodak started a colour print service in 1941 with the making of Minicolor and Kotavachrome prints from miniature Kodachrome and Kodachrome sheet films. The printing material was similar to Kodachrome except that it was coated on a white cellulose acetate base. Anso also produced a printing method similar to Anso Color in 1944, which was also used on a white film base for positive prints from colour transparencies.

A number of colour printing services were started by

private companies for the production of colour prints. One of the first of these was Triak, which discontinued its services when the war started. After the end of the war the Pavelle Color printing service started on Oct. 26, 1945. It was the first company outside of Kodak to use automatic colour printers for continuous processing methods. Its printing machines had a capacity of turning out 20,000 3x4½-in. colour prints from miniature colour transparencies per day. A few months later a printing service for 5x7-in. and 8x10-in. colour prints was available.

In 1943, Ansco colour paper was available for the U.S. armed forces and for essential industries. This material had a multilayer emulsion with incorporated colour components coupling with the developer by-products to produce direct colour prints. Colour prints were made from either colour-separation negatives, successively exposed through three colour-separation filters, or from complementary colour negatives (single exposure). Ansco colour paper was used in the preparation of military maps in colour and also for making machine drawings and wiring diagrams to facilitate line production of intricate devices in factories.

Ansco Color Reversible Printon was announced in 1944. Colour transparencies could be printed on Printon in much the same way as black-and-white negatives were printed on sensitized paper. A sheet of Printon was given a single exposure through the colour transparency either by contact printing or enlarging. After processing the exposed Printon sheet the result was a full-colour picture similar to the original transparency. The basic principle

of Printon was simply that of reproducing in the three Printon layers the three dye images of the original transparency. Printon closely resembled Ansco Color Reversible film in structure and in the principles on which it was based, although the two materials were modified to adapt them for different purposes.

Kodak introduced the dye transfer process in 1945, an improved and simplified wash-off relief process for colour print making.

Technicolor films in the professional motion picture field were greatly improved in quality during the decade 1937-46. The early Technicolor films looked very crude with their limited colour range as compared to the later prints with their spectacular colour rendering. Technicolor printing depended upon the wash-off relief or dye transfer process in which the gelatin layers were stained with the appropriate dyes after the three separation images were printed onto the positive. In 1942, Technicolor started to use 16-mm. Kodachrome for making some of the originals for their 35-mm. Technicolor prints. A number of combat motion pictures made with 16-mm. Kodachrome were released to the theatres by printing onto Technicolor.

A number of colour processes which appeared during the decade did not become widely used. Dufaycolor film, a screen-unit additive type colour film, was available in motion picture film and also still camera sizes. However, the screen pattern of Dufaycolor film was somewhat objectionable and the other colour films which gave fine colour

Exploding bomb, photographed at 1/270 sec. at the army's Aberdeen proving ground in Maryland. Bright streaks indicate the paths of fragments of bomb casing travelling faster than two miles per second

tones without any screen or grain pattern were preferred. The Finlay colour process, also a screen-unit type, was used for commercial illustration until Kodachrome became available in sheet film form. Several short-lived colour processes were of the lenticular base and dupac types. Gasparcolor was another process which was still in the experimental state, although some materials were available for military purposes.

The Photographic Process.—Along with the many developments in sensitized products, there naturally followed new procedures and formulas for processing. Until 1936, the toxic paraphenylenediamine chemical had been used extensively in many of the fine grain developing formulas. The processing formulas for the larger films were pretty well standardized with the use of the same chemicals which had been available for many years. In 1934, however, Kodak had introduced a new alkali known as Kodalk to replace the common carbonate. In 1937, Harold Harvey produced the first fine grain developer and replenisher combination known as Panthermic 777. Until that time, the exhaustion of developing solutions was not seriously taken into account in most amateur work. The first few negatives in a solution would have good quality, while later negatives developed in the same solution would usually have a poorer quality caused by the developer exhaustion. Harvey worked out an accurate system for replenishment after each film was developed. In this way the tenth or twentieth film would have the same developing time and contrast as the first film to be used in the solution.

Photographers eagerly followed all the new literature on their favourite subject and tried out the new solutions as they appeared. It was an era of great experimentation on the amateur's part. The research laboratories made slow but valuable progress in producing new developers and processes. Concentrated liquid developers and fixers were produced. Rapid processing solutions were made for the press photographer and others who had to meet quick deadlines with their pictures. In 1939, the Eastman Kodak company put out a fine grain developer without paraphenylenediamine known as DK-20, which consisted of an Elon developer with sodium thiocyanate for producing fine grain. Many of the photofinishers used this developer for their fine grain developing.

Ready-mixed chemicals in attractive packages became quite popular. For many years the photographer had weighed and mixed his processing chemicals. But with the low cost and convenience of packaged developers, fixers, toners and intensifiers the photographer was quick to adopt these new short cuts in his work. In 1941 Ansco brought out a fine grain developer known as Finex, which gave good negative quality without loss of film speed. During World War II, Kodak developed a tropical pre-hardener which enabled the processing of photographic negative materials at prevailing temperatures in the tropics without deleterious effects, physically or sensitometrically. The solution contained formaldehyde, sulphite and an antifoggant. Negatives could be developed at temperatures up to 110° F. An extensive investigation of the washing of photographic film and paper products was also completed. It was found that sea water could be used successfully in reducing the washing time.

Ammonium thiosulphate was added to the fixing bath as a rapid fixing agent. This chemical could be used in place of hypo (sodium thiosulphate). It was valuable for the quick processing of aerial reconnaissance films and also for industrial uses such as in the rapid processing of X-ray films.

Many other improvements in processing methods ap-

Low level "shots" such as this one of Normandy beach defenses were photographed along the French coast from Calais to Cap de la Hague prior to D-day, 1944. Results of such hazardous missions provided realistic material for briefing invasion forces

peared during the decade, including newly packaged chemicals. Some of these, which appeared in 1945, were: Kodak Dektol, a long-life paper or film developer; Kodak Microdol, a new improved fine-grain developer; Kodak Versatol, a new liquid all-around developer for films, plates and papers; Kodak Selectol, a clear working developer for professional papers; Kodak Antical, a sequestering agent for prevention of scum and sludge formation in photographic developers; Kodak Rapid Liquid Fixer (with hardener) and Kodak Universal MQ Developer; also Kodak Anti-foam, a clear, colourless liquid for prevention of foaming of photographic solutions. F. W. H. Muehler and J. I. Crabtree devised a quinone-thiosulphate intensifier which produced a greater degree of intensification when used with high speed negative materials.

Flash Photography.—Synchronized flash photography revolutionized photographic methods and cameras in almost every field. The photographer was no longer dependent upon sunlight or the usual artificial illumination when he was equipped with camera, synchronizer and flash lamps. The ordinary flash lamp reached its peak of illumination within 20 milliseconds, and the ordinary between-the-lens shutter on a camera took about 5 milliseconds to reach full opening. In order that shutter and flash lamp would coincide a flash synchronizer was placed on the camera. The flash synchronizer consisted of a battery case, holding two or three 1½-volt dry cells, the flash lamp socket and reflector, and the tripper, mounted on the lens shutter. When a picture was to be made, the release button

on the synchronizer was pressed to close the electric circuit through the mechanism. This current went to the flash lamp first to ignite the primer coating, surrounded with aluminum shredded-foil in an atmosphere of oxygen. The burning primer thus ignited the aluminum and the entire contents of the bulb burst into a brilliant flash of about 1/40 sec. duration. The tripper on the shutter was automatically operated so that the shutter would reach its full opening when the flash lamp was at its peak.

Midget flash lamps, introduced shortly before World War II, were much smaller than the average flash lamp, easier to carry in the photographic case and quick to use. Amateurs and press photographers used these midget flash lamps in greater quantities until, in 1946, the majority of flash lamps sold were of the midget type. During the war, the blackout flash lamps were widely used. These lamps had an infra-red coating on the bulb and when flashed were practically invisible. They were used with infra-red film in the camera for making the exposures. There were

Edward Steichen assumed supervision over all navy combat photography in the summer of 1945. He is shown on an island platform of the U.S.S. "Lexington" off Tarawa

also blue-coated flash lamps for use with Kodachrome, Daylight Type film.

Some of the pioneers in the manufacture of flash synchronizers included the Heiland Research Corp., the Kalart Company, Inc. and Mendelsohn Speedgun Company. In 1942, the Ilex Optical company brought out a complete shutter with the synchronizing mechanism built into the shutter. Cumbersome flash synchronizer attachments were normally mounted on the camera body and outside camera shutters. With this new Ilex synchro-shutter, everything was built right into the shutter mechanism. Adjustments were provided for setting time delays from 0 to about 30 milliseconds. With this range of settings, all types of flash lamps could be used—such as the Kodatron Speed Lamp, reaching its flash peak at 0 milliseconds; the SM midget lamp, peaking at 5 milliseconds; the No. 22 Photoflash, peaking at 20 milliseconds, and the No. 3 Superflash, peaking at 30 milliseconds. It was the first synchronizer made for universal use with all flash lamps.

The pioneer work of Ilex was soon followed by Wollensak Optical company, Graflex, Inc. and Kodak in the production of the high speed Rapax, Graphex and Supermatic shutters with built-in synchronization. The built-in shutter synchronizer was probably as important to flash photography as the introduction of panchromatic films were to photography in general.

Flash lamps were taken off the amateur market during World War II and were obtainable only by commercial photographers on special priorities. Enormous quantities of flash lamps were used in the armed services. A year after peace was declared the flash lamp manufacturers were far behind in filling all the orders because of the unprecedented demands from amateurs, professionals and military sources. The field of flash photography expanded continually.

Lenses.—In 1941, a new type of nonsilica optical glass of high refractive index and low dispersion was introduced for making lenses for aerial cameras. This new glass represented a revolutionary scientific advance and undoubtedly was the first basic optical-glass discovery since the introduction of the famous Jena glass in 1886.

Still another basic improvement in lens manufacture was the successful use of surface coatings for the reduction of surface reflections in lenses. Various methods had been tried, but it was not until Professor John Strong published a description of his method that lens coating began to be used extensively. Strong's method provided for a thin film of a crystalline material which could be evaporated and condensed upon the glass under a vacuum. Later research improved upon this process until, by the end of the decade, coated lenses were sold by all lens manufacturers. With this surface coating, from 5% to 15% of the unwanted light reflections within a lens could be eliminated. The coating was also used on binoculars to give a higher light transmission and better viewing quality.

The first Kodak Ektar 14-in. $f/6.3$ lens appeared in 1939. In 1942, new Ektar lenses in focal lengths of $8\frac{1}{2}$ in., 10 in. and 12 in. were made. War demands led to the development of new lenses in England and the United States. With the aid of the new rare-element glass, the lens manufacturers were able to produce products which not only matched some of the best continental lenses but in many cases showed superior qualities. One example was the monster 48-in. $f/6.3$ lens made by Kodak for aerial photography. This lens had a thermostatically-controlled electrical warming device in the mount for use in the cold upper regions. Without this heating device the lens would shrink enough at low temperatures to throw it out of focus,

Objects up to five miles away were clearly revealed. A new lens cement was produced by Kodak to meet the extremes of heat, cold and high humidity encountered in desert fighting and stratosphere flying. Previously a large number of lenses had been cemented with Canada balsam, which cracked and discoloured under extreme weather conditions.

High-Speed Photography.—Development of high-speed still and motion pictures was important in the production of war materials and in the research laboratories. Harold E. Edgerton developed the high-speed 'stroboscopic' lighting for making as many as 600 exposures on one film. The same type of lighting was also applied to high speed motion picture cameras, which made several thousand exposures per second. This type of photography was quickly applied to many industrial production problems. The air movements around propeller blades was studied, machine defects were easily detected and many ballistic experiments were carried out. The high-speed motion pictures were projected at normal speed, and the cutting edge of a machine tool or the oscillation of synchronous motors gave up their secrets in slow motion.

Edgerton also developed the gaseous discharge speed lamp which flashed in 1/10,000 second. As no camera shutters could operate at such a high speed the speed lamp flash served as the only shutter. The camera shutter was opened and closed at a normal speed of possibly 1/50 second. During this operation the flash was discharged when the shutter was wide open. By the use of speed lamp photography all types of fast motion could now be recorded for study. The secret of a bird's flight was revealed along with the efficient or inefficient action of a fan turning at full speed.

Robert W. Cairns developed the rotating-drum camera, used to photograph the detonation waves of explosions, travelling 5 to 25 times faster than sound. This camera recorded explosions of 1-kg. charges about 6 in. long. A slow explosion is one that lasts about 100-millionths of a second. This high speed camera was used to record all the details of the activity of explosions for military purposes.

To gain knowledge about the behaviour of rockets during the early part of their flight, the Ribbon-Frame camera was developed by C. N. Hickman of the Bell Telephone laboratories. The camera used a standard No. 122 film, 3¼ in. wide and 35 in. long. The film was carried past a .15-in. slit, and each frame was thus .15 in. high and 3¼ in. wide. More than 200 frames could be taken on a single film. The exposure time was adjustable from .0001 to .0006 sec. A dial on the outside of the camera indicated the amount of unused film. As the rocket or shell was fired, the clutch button was pressed, thus connecting the film roll to the drive and a set of exposures made in rapid sequence.

Amateur Photography.—The field of amateur photography cut through every class and profession. The school boy or girl became just as enthusiastic about photography as the older person. Estimates showed that there were at least 25,000,000 cameras in the United States at the end of the decade 1937-46. During World War II, the majority of these cameras had to be laid on the shelf, but in the postwar period there was more activity than ever in the making of snapshots. The amateur could now purchase panchromatic films sensitive to all colours; high speed and fine grain films; and for the first time he could extensively use colour roll film. Cameras were more compact and were fitted with faster lenses. New enlargers and many new accessories developed during the decade contributed to the expansion of photography.

Because of the priority requirements of the various

military departments, photographic materials were extremely scarce for the general public during the war. However, by March 1944, the War Production board freed from its restricted list all photographic products which had a retail price of ten dollars or less. Following this ruling, the Office of Price Administration fixed ceiling prices on used photographic equipment. By the end of 1944, Photoflash and Photoflood lamps were again available for the amateur in restricted supply. Film rationing continued throughout the war years in order to give a more equitable distribution among amateur photographers.

Hundreds of new camera clubs were formed during the decade. Conservative estimates showed that the number of clubs more than doubled during this period. By 1946, there were more than 10,000 active camera clubs in the United States and hundreds more in Canada and England. One of the contributing factors to this rapid development in photography was the deluge of photographic literature which appeared in new photographic magazines and books. Many an amateur was often better informed about his subject than some of the old time professionals.

New photoelectric exposure metres took the guess-work out of picture making. Better picture results raised the enthusiasm of the amateur as he took more photographs and continued to maintain his interest. Photoflash and Photoflood lamps were still another factor in the new popularity of photography. With these lamps the photographer was completely free to make his exposures wherever he wished. The popularity of the 2x2-in. colour slide created new demands for the miniature camera using 35-mm. film.

Amateur movies on 8-mm. and 16-mm. films were taken in record volume. Kodachrome colour film, first introduced in 1935, was widely welcomed by all amateurs using 16-mm. cameras. Then, during the following year, this popular colour film was made available for 8-mm. home movie cameras. New ciné cameras and accessories followed in rapid succession until there were over 400,000 amateur movie cameras in the United States alone. With the development of sound on the 16-mm. films, the amateurs became still more enthusiastic. During World War II the greatest progress in 16-mm. sound motion pictures was made in the U.S. military services, where huge training film programs were prepared. By 1946 the sound projectors were again available to the public, along with many improvements in quality.

The Land Camera.—Announcement of a camera capable of producing a finished photograph in one minute caught the instant attention of all photographers in Feb. 1947. During the preceding century of photographic progress the camera operator had relied on making a negative and then carrying out a lengthy processing technique before obtaining the final photograph. By use of this new quick photographic process, invented by Edwin H. Land of the Polaroid corporation, the photographer could actually produce a finished photographic print from a negative within 60 sec. This Land camera seemed destined to be as important a factor in the development of photography as was the introduction of the dry photographic plates in 1874, replacing the wet plate processes.

Any conventional camera could be adapted to use the Land quick-print process, with the addition of two small rollers on the camera back similar to a clothes wringer. The negative film is loaded in one end of the camera and the special paper in the other. After a picture is snapped, a turn of a knob on the side of the camera advances the

film and paper out of the camera, through the rollers. The rollers press the film and paper into a temporary sandwich. When they are peeled apart a minute later the paper has become the finished print.

The automatic processing of the minute-print is carried on within the sandwich without tanks or other devices within the camera. When the sandwich passes through the rollers the pressure breaks a tiny pod or sealed container attached to the special paper at regular picture intervals. This pod releases a few drops of a viscous chemical mixture which spreads in a moist layer between film and paper. The chemicals develop the negative and simultaneously form the positive print. The opaque outer surfaces of the film and paper prevent the negative from being fogged by light when it is pulled out of the camera in sandwich form. Film and paper are then separated and picture is ready for use.

The few drops of viscous chemical released within the paper and film sandwich, when the winding knob sets the rollers in operation, contain both developer and hypo. Both chemicals go to work promptly—the hydroquinone turning the exposed crystals into silver on the film and the hypo taking into solution the silver of the unexposed crystals. The exposed crystals of the negative image are turned into silver and kept within the film out of circulation. The silver from the unexposed crystals, however, is free to move. The hypo takes this silver into solution within the thin layer of reagent between paper and film where the chemicals develop and deposit it onto the paper to form the positive image.

The developer performs the double service of holding silver of the exposed grains out of circulation in the negative, and forming the positive image from the silver carried into solution by the hypo. The hypo performs a shuttle service, carrying the silver in the unexposed crystals from the film to the paper, and returning for more when its load of silver complex has been taken from it by the other chemicals.

Miniature Photography.—Miniature camera photography came to a climax of its progress during the decade 1937–46. This development in photography had its start with the Leica camera, first introduced to countries outside of Germany in 1925. The photographers were slow to accept this small camera, which made 36 double-frame pictures on standard 35-mm. motion picture film. By 1930, the Leica was fully accepted by many amateur and professional photographers. Interchangeable lenses, dozens of accessories and improvements in the Leica models followed. In 1935 the 500-page *Leica Manual* appeared, the first book of this size ever published on one type of camera. By 1936 the Leica camera was in great demand, and miniature camera photography was really in full flower.

Other miniature cameras soon made their appearance, such as the Contax and Retina, using 35-mm. film. Many low priced 35-mm. cameras were being sold by 1939. Then, in Aug. 1940, the Kodak Ektra was announced, although actual deliveries of this 35-mm. camera did not start until 1941. A new line of miniature cameras appeared in 1938 known as the Kodak 35s. Many of the miniature cameras appeared in new models with faster lenses and some with built-in range finders for more accurate focusing.

Factors contributing to the popularity of the miniature cameras included the following: (1) New fast panchromatic 35-mm. motion picture films were produced, and also films with finer grained emulsions; (2) New fine grain developers were perfected to insure the production of fine quality

negatives which would stand great enlargement; (3) The new fast lenses with apertures of $f/2$ and $f/1.5$ captured the imaginations of photographers who were now able to photograph in dimly lighted places; (4) The candid type of photograph had its greatest novelty during this period because of the ease with which the miniature camera photographer could obtain all kinds of off-guard photographs of people; all this created new demands for these small cameras; (5) By the time Kodachrome 35-mm. film was available, the miniature camera was really in great demand. Photographers could now make a series of colour pictures in any 35-mm. camera and later project these colour images when mounted in the popular 2x2-in. lantern slides.

Starting about 1935, there was a definite trend toward the use of the larger miniature cameras which made $2\frac{1}{4} \times 2\frac{1}{4}$ negatives like the popular twin-lens Rolleiflex camera. In 1939, the $2\frac{1}{4} \times 3\frac{1}{4}$ Speed Graphic was placed on the market. This camera represented the largest of the miniature cameras and attained wide popularity. Two years later, the $2\frac{1}{4} \times 3\frac{1}{4}$ Kodak Medalist appeared. This camera used roll film, but was also adaptable for sheet film, film packs, and plates. It also included a military type coupled range finder and an excellent coated lens made by Kodak, known as the Ektar. Until about 1940, sale of the 35-mm. cameras exceeded the sale of the larger miniatures. From then on the proportion changed in favour of the larger miniatures.

Many of the 35-mm. miniature camera features, such as interchangeable lenses, coupled range finders and fast lenses began to appear on the large miniature cameras. This was one of the important reasons for the increased sales of the larger cameras. The production of fine-grained negatives because of the large film sizes was still another important factor. During the war period, the manufacture of miniature cameras for general amateur use was discontinued. During the first year after peace was declared there were no exports from Germany. The manufacturers in England and the United States were slow in producing cameras, although the demand for all types was tremendous.

Microphotography.—Microphotography is the process of copying documents or similar materials onto 16-mm. and 35-mm. films. Although other film materials could be used, the motion picture sizes continued to be preferred because of their convenience and speed in working. The resulting microfilm negative is too small to be read with the unaided eye, so readers or projectors were devised to make the enlargements for later use.

During the decade 1937–46, microphotography became a multi-million dollar business with tremendous demands placed upon it for many war purposes. Blueprint specifications were reproduced in quantity in order to have complete sets of plans available for the use of repair crews at advance bases. Vast quantities of field records were micro-filmed for preservation and for transfer to home offices in England and the United States. Captured documents were reproduced in order to provide copies for the Allied powers and permit detailed surveys of axis technical progress to be made. Under the direction of Henry Wallace, the department of commerce started the huge task of copying all the important industrial and scientific files in the

Examples of work by three outstanding photographers of the decade 1937–46. Top: Pius XII, then Cardinal Pacelli, at Montmartre, France in 1937; photo by Henri Cartier-Bresson. U.S. occupation territory for release to the public. Microfilm reports on the actual strips of film could be purchased, covering hundreds of different subjects of interest to the research laboratory and industrial plant.

One of the most interesting academic developments during 1944 was the announcement of the micro-card theory as applied to scholarly, scientific and academic microphotography. Fremont Rider outlined the micro-card system in his timely book, *The Scholar and the Future of the Research Library*. The micro-card envisaged the reproduction of from 100 to 500 pages of text, containing all or a substantial portion of a complete book, on the back of a conventional library card. The micro-card, would be filed in a library catalogue and the enquirer would remove the card and consult it on special reading equipment as though it were the original text. The theory gained in interest, and special equipment was made for this work, which included copying equipment and improved readers.

An interesting development in 1944 was the formation of Projected Books, Inc. This nonprofit organization had for its objective the development and application of a new method whereby patients in hospitals might read. A special power-driven microfilm projector was developed which projected a greatly enlarged image of a printed page on the ceiling of a hospital ward or on a special screen. The machine was noiseless in operation and the controls were arranged so that pressure by a finger, a toe or even an elbow would advance and retract a page on the reading screen. Tests clearly demonstrated the beneficial effects of this method of therapy for wounded soldiers, who might read educational or recreational material at will. Argus was making the machine while the film was being prepared by University Microfilms in Ann Arbor, Mich.

In England, special microfilming projects made records of important treasures and works of art in museums and libraries during the heavy bombing periods. The microfilm copies were then sent abroad for safe keeping. A spectacular use of microfilming occurred during the siege of Leningrad in 1941 when the new Shostakovich *Seventh Symphony* was copied and flown to New York city. The 252 pages of this symphony were copied on 100 feet of 35-mm. film and printed upon arrival. The music was presented at the N.B.C. studios under the direction of Arturo Toscanini. Other uses of microfilms included copying of the U.S. census records, of all numbers drawn in the United States selective service lotteries, of millions of official documents in government offices and of important drawings and machines interchanged between England and the United States.

V-Mail.—In April 1941 the British adopted the Airgraph system to solve the problem of getting mail to and from the forces in the near east. In 1942, the system was put into operation for the U.S. forces, scattered over the world, under the name of V-mail. The process was worked out by the Eastman Kodak company, originally with the object of using it for the rapid transit of mail by aircraft in peacetime. Arrangements were made for its operation with Pan American Airways and British Overseas Airways, and when war came the service was offered to the U.S. and British governments. The method employed was to write a letter on a special sheet of paper which was photographed on a 16-mm. film and flown in this form to its destination. There it was enlarged onto a sheet of paper, folded, sealed in an envelope and sent to the addressee. Eighty-five thousand letters, which would normally weigh about 2,000 lb., weighed only 20 lb., in film form. Millions

of letters were sent each week during the war by V-mail. This system of communication was finally discontinued on Oct. 26, 1945.

The postwar development of microphotography promised to become even more important as individuals, libraries, educational institutions, industrial plants, newspapers and others began to utilize this valuable means of research and preservation of records. Colour microfilm was being used for some projects. New legislation specified certain procedural changes and requirements intended to streamline the uses of microfilm. State legislation for the use of microphotography was extended by passage of special acts. The state of Illinois, for example, passed two separate acts legalizing the use of microphotography.

Applied Photography.—The discovery in 1926 that electron beams could be focused in the same way that light beams are focused with glass lenses led to the development of the electron microscope. By the time World War II started, electron microscopes had been manufactured and placed in a number of research centres in England and the United States. A similar development was also taking place in Germany. The electron microscope was capable of producing enlargements of minute objects up to 100,000 diameters in combination with the photographic negative.

One of the early surprises revealed by this microscope was that the developed silver grain in photographic emulsions actually was a tangled mass of thread-like material instead of a coke-like substance. Coarse filaments were produced with a typical hydroquinone developer, while Amidol and Metol made finer threads. During the following years, many original observations and discoveries resulted from electron microscope research. But because of military security these findings were not made public.

In the chemical field, the possibility of using the R.C.A. electron microscope as a high-precision electron diffraction camera added greatly to its utility. It was also used for surface observation, essential in metallurgy, in two different manners: (1) by the preparation of very thin plastic replicas of the surface to be studied, which were then examined in the standard instrument by transmission, and (2) by the development of a "scanning electron microscope" for the direct examination of surfaces. The latter combined the techniques of electron microscopy and electric picture transmission (facsimile) to obtain greatly magnified recorded images of surfaces.

An important wartime development was a method of photo tracing, developed by Kodak, for use in industrial plants to shorten the time required for making line drawings. This was known as the template or photolifting process in which line drawings were transferred to metal by photography and the metal then cut to make templates and parts for use in manufacturing. The procedure in this process was first to apply a stripping layer of sensitized emulsion or spraying with emulsion followed by direct printing from enlarged negatives. The drawings could also be made on metal sheets with fluorescent material which would glow after being exposed to X-rays or ultraviolet light. The Ansco company prepared a template process available for industrial use which was instrumental in saving many thousands of man-hours as well as a large part of production cost.

Westinghouse research engineers developed a cold-cathode X-ray tube which operated at a peak of 300,000 volts with currents ranging from 1,000 to 2,000 amp. during the discharge. In 1944 the use of this highspeed radiography was applied almost exclusively to ballistics research.

"Yucca, Mojave Desert," by Edward Weston, shown at a 1946 exhibit of his work at the Museum of Modern Art, New York city

The high-speed X-ray photographs showed that a high-explosive shell inflates to twice its normal diameter just before it bursts open inside armour plate and that the blast which accompanies the firing of a rifle bullet beats

the missile to the muzzle. Such pictures were exposed at $1/1,000,000$ sec. Ultra-speed X-raying was the only adequate method of determining how a bullet or shell behaves as it is projected down the bore of a gun and as it strikes the target. This same technique could also be applied to the study of the internal parts of rapidly mov-

Bobby Jones driving a golf ball, photographed by multiple-flash, a process first demonstrated by A. G. Spalding & Bros. on Dec. 7, 1938, which made possible successive exposures of $1/100,000$ sec. each, without blur. The exposure time was determined by controlled light flashes from a gas-filled tube

ing machines. A 2,000,000-volt X-ray tube was perfected by the Machlett laboratories. This new precision tube brought to the field of X-ray the same sort of improvement in definition that the electron microscope, compared to the standard microscope, brought to the field of optics.

In 1937, photographs were made which resulted in the discovery of infrared radiation in interstellar space. Also plates very sensitive to the extreme red were used in the investigation of stars normally invisible through nebular haze. Photographs made by Major A. W. Stevens from high altitudes during the 1937 solar eclipse gave evidence that the corona is globular in shape.

One of the valuable developments of the decade was a polarizing sheet material invented by Edwin H. Land and known as Polaroid. This polarizing material could be used to control the bright reflections when photographing objects and also to darken the sky in outdoor photography. It was also used in stereoscopic photography. (See below.)

During the summer of 1940 George L. Clarke of Harvard university and W. Maurice Ewing of Woods Hole Oceanographic institution collaborated in the making of important ocean bottom photographs with the aid of flash lamps. A small camera was lowered to a fixed distance above the ocean bottom, and good photographs were obtained at depths ranging from 125 ft. to nearly 3,000 ft. (See also CARTOGRAPHY; MOTION PICTURES; NEWSPAPERS

AND MAGAZINES; X-RAY.)

(W. D. Mn.)

Three-Dimensional Photography.—During the 1936-46 period, several brilliant inventions made it practical, for the first time, to show three-dimensional motion pictures in full colour to large audiences. In effect, these inventions converted the three-dimensional picture from an interesting toy into a valuable tool of art, science and industry.

In Jan. 1936 Edwin H. Land, inventor of Polaroid light-polarizing filters, made the first public showing of the three-dimensional motion pictures in full colour which he and his associates had been developing for several years. The pictures had depth. The people and objects in them appeared not only in their true height and width—the two dimensions of ordinary pictures—but in their true depth as well. They looked real. The people in the audience were tempted to reach out and touch them. The edges of the screen were like the frame of a window opening into space. Millions of people had seen still three-dimensional pictures—but always one person at a time, through a stereoscope. Now, the pictures were not only in motion, not only in full colour—but a whole group saw them, all at the same time.

In taking his pictures, Land had followed the practice

used by makers of still three-dimensional pictures for more than a century. He set up two cameras, side by side, with their lenses as far apart as the distance between the human eyes. He took two sets of pictures, or stereograms, of the scene at the same time. With two projectors arranged in the same way, he projected these stereograms on a screen, one over the other. But over each projector lens he placed one of the light-polarizing filters he had recently invented. After going through the filter, each picture was made up of light vibrating in one direction only. He turned the filters so that one picture's light vibrations were at right angles to the vibrations of the other picture.

Each member of the audience wore spectacles fitted with filters arranged in the same way. When the two pictures, mixed together in a confused jumble, came back from the screen to his eyes, each of his viewing filters stopped the light of one picture. His left eye saw only the picture intended for it; his right eye, only the right-eye picture. It was as if each member of the audience was present at the scene, picking up with his own two eyes the slightly dissimilar images that create the sensation of depth and solidity when they are fused together by the brain.

John Anderton, an Englishman, had suggested the polarized light scheme in 1891. But he had been unable to put it to practical use because there were no suitable polarizers. With his new polarizing filters, produced in great quantity and low in cost, Land had answered the question of how to show three-dimensional pictures to many people at once.

Soon after Land's demonstration, millions were looking at three-dimensional pictures through his polarizing viewers. By 1939, J. A. Norling had produced the first commercial three-dimensional colour movie (for Chrysler Motors) and was showing it at the New York world's fair. R. V. Brost and the brothers, C. and G. Lewis, were producing beautiful still pictures of the national parks, museum exhibits and industrial scenes. Hundreds of amateurs were making their own three-dimensional pictures and using the new scheme for showing them to their friends.

But Land and his associates were already working on an entirely new kind of three-dimensional picture. The double-projector scheme was effective, but it still called for two projectors and some careful adjustments. Moreover, all the pictures were projected; there was nothing corresponding to the paper print of ordinary photography. In 1940, before the Optical Society of America, Land presented a full answer to both problems. In 1938 the Czechoslovak experimenter, J. Mahler, had suggested to Land that a new kind of three-dimensional picture could be created if the individual images could be rendered in terms of percentage of polarization instead of in dyes or pigments. At Land's invitation, he joined the Polaroid research group. Land and Mahler then developed processes for making the pictures, called vectographs, not only in black and white but also in full colour. They put two polarizing films together, with their polarizing directions at right angles. They then set up varying degrees of polarizing power in each film, corresponding to the lights and darks of the two pictures. This composite polarizing picture looked and handled like an ordinary photograph, with blurred images. But when viewed through polarizing spectacles, it appeared as a perfect three-dimensional picture.

The vectograph was the first successful three-dimensional picture in the form of a single print. It was easy to view. It preserved all the detail of the original views. Most important, vectograph slides or motion picture film could be thrown on the screen through standard projectors with no

attachments whatever.

After 1938, much of the work in three-dimensional photography centred around applications of polarizing projectors and the vectograph. Two other developments, however, received attention.

In the United States, D. F. Winnek worked out a new process for making full-colour three-dimensional pictures of the parallax-grid type, originally invented by F. E. Ives. This type required no viewing device whatever. Winnek's pictures were transparencies, made with a special camera on film embossed with fine lenticules or ridges. They were coming into commercial use for portraits and technical subjects.

In the U.S.S.R. there were further reports of a new system, credited to S. P. Ivanov, for showing three-dimensional movies without requiring the audience to wear spectacles; reports described a screen of 2,000 finely cut and matched mirrors.

During World War II, all armies used three-dimensional pictures, taken from the air, to get most of their information about the enemy. At the war's end, the newly-invented Sonne continuous-strip camera was taking pictures, at 300 m.p.h., which showed the fingers and buttons of enemy sentries. Allied anti-aircraft machine gunners got most of their practice by firing three-dimensional images of tracer bullets against three-dimensional movies of attacking planes. U.S. troops studied aerial vectographs to get the lay of the land before they set foot in Normandy, Kiska, Leyte, Okinawa and other beachheads. Air gunners studied three-dimensional coloured drawings to memorize the cones of fire laid down by enemy aircraft. With three-dimensional pictures, gunners learned how to take apart and reassemble their automatic weapons; navigators mastered the complexities of celestial trigonometry; observers got acquainted with the look of enemy ships and planes.

During 1946, designers and manufacturers were busy applying the new techniques and inventions. Several plants started making vectograph prints and lantern slides. Amateur photographers in the United States were offered two new three-dimensional double-lens cameras, the "Stereo-Realist" and the "Tri-Vision." Engineers designed small, compact versions of the stereoscope, inexpensive and easy to use, notably the "Viewmaster" for showing 16 mm. and the "True-View" for 35 mm. still pictures. The "Stereo-Tach," an ingenious device for funneling two pictures through a single lens, was making it easy for amateurs to take and show three-dimensional pictures with ordinary cameras and projectors they already owned. Parisians were buying three-dimensional portraits that required no viewing device at all, apparently made by a process similar to Winnek's. Students learned the space-relations of solid and descriptive geometry from three-dimensional vectographic lantern slides prepared by J. T. Rule. The U.S. optical profession was prescribing courses in visual calisthenics, employing special sets of vectographs, for people with faulty vision. Manufacturers were showing their wares and scientists their experiments in three-dimensional pictures.

Photographic Art.—Historically speaking, the two most significant events in the world of photography during the decade 1937–46 were the flowering of the "Documentarists" and the death of Alfred Stieglitz in 1946. The first opened new vistas of the application of photography to the problems of society, the last closed a noble life dedicated to the application of photography to the deeper needs of the human spirit.

The irresistible impetus of technological expansion during the decade was reflected in the mechanical, social and aesthetic advances of the art and craft of photography. No one could sensibly dispute the stature of the camera in relation to civilization and, specifically, to creative expression. In America, the enthusiasms of the Roosevelt reconstruction, the emphasis on both human and abstract values of expression, and the terrible tensions of World War II, joined to create both a tremendous industry and a mature visual language.

While the mechanical applications were accelerating, many interpretative and contemplative aspects were submerged. The frenetic promotion of "popular" photography, and the wild competitive scramble of the manufacturers to build markets on mass interest stressed obvious and superficial enticements. Few clear distinctions were made between representation and expression; an unfortunate emphasis on *subject* was evidenced in the photographic magazines, in advertisements and even in museum presentations. The pictorial salons, being the focal points of low-intensity expression, maintained the *status quo* of the conventionalist and the hobbyist. The few attempts to inject more serious and personalized work in the salons were feeble in numbers compared with the uncounted thousands of typical "pictorial" examples displayed and accepted by both amateurs and laymen as the type-standard of camera work. In fact, pictorial photography definitely deteriorated during the decade; the most obvious aspect of this deterioration lay in the emphasis on sterile themes and poor print-quality. This relaxation of standards infected commercial photography to the extent that increasing numbers of pseudo-photographic paintings were used by advertisers as obviously more effective than mediocre colour-photographs. Of course, the years of war depleted both photographic talent and materials; most of the younger men were in the armed forces, and the magnitude of industrial production did not favour consistent qualities of equipment and materials, to say nothing of their availability to the civilian. Technical standards in the armed forces were high; expressive standards low. Purely interpretative work suffered a serious decline: the years of war could well be defined as a period of *automatism and observation*.

Fortunately, there were some exceptions to this general statement; some of the war photography—military and press—was most impressive. In times of stress a sincere and intense expressive intention may emerge above the structure of necessity and convention. Significantly perhaps, the greatest operations, the most startling events, do not lend themselves to photographic expression. They are complete in themselves, and it is only by the merest chance that the event and its interpretative perception are coincidental. For example, the photographs of the atom bomb explosions, and the actual burning of London may be emotionally inferior to the organized and integrated

images of the shattered city, of a body prone upon a South Pacific landing beach, or a face of misery and starvation. The accidental exposure may be impressive because of the significance of the subject alone—not because of any possible integration by the artist. Photography has been, and probably always will be most effective in relation to the intimate and poignant aspects of the world, to simple things in their *considered* and *felt* moments of highest significance.

Nevertheless a few small but vital circles supported the clarification of aesthetic standards of photography during the decade, and encouraged appreciation of the more subtle objectives of the art. The department of photography of the Museum of Modern Art was established in 1940; for the first time since the Photo-Secessionists under Alfred Stieglitz, a vital, aggressive centre of creative photography commanded public attention and accomplished an important interpretation of functional and aesthetic standards. Under the able direction of Beaumont and Nancy Newhall, in the face of considerable opposition from reactionaries and super-*avant garde* documentarists, exhibits of great historical and creative importance were presented, ranging in time through David O. Hill, Mathew Brady and the American Frontier photographers, and Eugene Atget, to the comparatively recent exhibitions of Edward Weston and Paul Strand.

Retrospective exhibits—"Photography, 1839–1937" (organized and presented by Newhall prior to the formal establishment of the department), "Sixty Photographs," and the contest exhibition "Image of Freedom"—together with numerous contemporary documentary shows, proclaimed the catholic attitude of the department and revealed the constructive trends of photography. The Weston exhibit was probably the most compelling photographic presentation since the supremely significant presentations of Stieglitz at "291" and "An American Place." Weston's work was one of the majestic accomplishments in photography; with that of Hill and Stieglitz his work represented the climax of creative intensity and power. (Photography was recognized by the John Simon Guggenheim Memorial foundation in granting Edward Weston the first fellowship in photography. Within the decade eight others were honoured with fellowships).

A few other centres in America developed a serious interest in creative photography, expressed in exhibits and forums in museums and galleries. Some colleges added photography to their list of major studies. While many schools suddenly appeared to take advantage of the federal and state veteran's training programs, only a few truly creative and advanced institutions presented photography in full measure of dignity and effectiveness. Among those few may be mentioned the Institute of Design, Chicago, The New School of Social Research, The California School of Fine Arts, Black Mountain College, and a few small but worthy departments in other centres. Commercial photographic schools were legion; undoubtedly the most effective was the Art Center School, Los Angeles.

It is impossible to list here all those who worked creatively and constructively in photography during the decade. Without depreciating those not named, we may list Lisette Model for her incredible images of people; Dorothea Lange, who injected a moving mystical intensity into documentary work (all too frequently sterile from a creative viewpoint); Brett Weston, who revealed a powerful technique and a growing creative personality; Barbara Morgan, Berenice Abbott, Arthur Fellig ("Weegee"), Manuel Alvarez Bravo, Arnold Newman, Frederick Sommer, Eliot Porter, Dorothy Norman, Wright Morris, Cedric

Wright—to mention only a few in the domain of creative photography.

Paul Strand, whose retrospective exhibit at the Museum of Modern Art reaffirmed his position as one of the greatest U.S. photographers, and who worked extensively with

"Gambler Type, French Riviera," one of a series photographed by Lisette Model, also known for her pictures of New York's east side

the motion picture camera, undertook an interpretation of New England. Ansel Adams, following his exhibit in 1936 at An American Place, explored various fields of creative and functional photography, and was engaged in teaching

and lecturing and in the preparation of several books on photography. L. Moholy-Nagy, Man Ray, Andreas Feininger, Gjon Mili, and others were typical of those exploring new paths of photographic technique and application. Among commercial photographers (a term defining those working chiefly in advertising and illustrative fields), Edward Steichen, Anton Bruehl, Nickolas Muray, Will Connell, Tony Frissell were among those who carried these applications to an impressive perfection. In the fields of news and reportage, such names as Alfred Eisenstaedt, Margaret Bourke-White, Morris Engel, Frank Scherschel and many others of this hard-working, far-travelling clan made the camera the equal, if not the superior, of the written word as an instrument of information, record and

"Navajo Mother and Child," a representative print by Ansel Adams, well-known for his photographs of California and U.S. national parks

significant interpretation.

In any country where, as it was claimed for the United States, 20,000,000 people use a camera casually or otherwise, the high development of the art and craft may be assured, for out of this great mass of interested people will come a proportionally large number of creative and technically advanced photographers.

The trends and momentums of the ten-year period indicated the future developments of the art. For one thing, professional competition was certain to be increasingly severe. The full vitality of the profession could be assured only by the establishment of state boards such as those governing architecture, medicine and law. The photographer had to be aware of the world about him, well-rounded in aesthetics and the social sciences. The ten years suggested one positive and constructive fact, that the day of the casual professional was over. Photography was destined to grow as a universal device of communica-

tion and expression and the layman would demand of the professional the same perfection achieved in the higher levels of music, letters and architecture. It was hoped that the layman would be encouraged to enjoy photography both as spectator and creative amateur. While it would always contain aspects of a contemporary folk art and simple hobby, photography would undoubtedly assume a place of dignity among the humanities. The decade revealed the tremendous potential.

Photon

See PHYSICS.

Physics

The most significant progress in the whole field of physics during the decade 1937–46 was in matters pertaining to nuclei rather than to atoms as a whole or to materials in bulk. The study of atomic nuclei was not, however, a subject isolated and distinct from other special branches of physics. The progress of the decade could almost be described as the culmination and co-ordination of the previous 40 years of advances in all branches of physics, ranging from the theoretical abstractions of relativity to the practical applications of the principles of electricity and magnetism leading to the development of new instruments and techniques. In the complexity of the science of those years, a new discovery in physics was of little value as an isolated item. Even to understand it, an acquaintance with the vocabulary, the background and the earlier history of physical discovery was essential. To be useful as a contribution to progress the new knowledge had to be assimilated with the old into a harmonious pattern.

The Fundamental Particles.—Physics deals with the properties of matter. It is necessary, therefore, to state what matter is composed of, even at the expense of brushing aside all difficulties connected with the meaning of the term. Every transformation which matter was known to undergo was explained in terms of some of the six fundamental particles listed in Table I, viz., the proton, the neutron, the electron, the photon, the meson and the neutrino. In many cases, the use of compound particles such as the deuteron and the alpha particle simplified verbal descriptions of these transformations. Had this list been prepared in 1937, the meson and the neutrino, being then hypothetical without the support of experimental evidence, would have been omitted. In the table, the duality of matter, confirmed by four decades of photoelectric experiments, and by remarkable demonstrations in 1943–44 of the diffraction of neutrons from a chain-reacting pile, has been recognized by classifying the photon as a particle. A typical stable atom, undergoing no transformation, consists of a tiny nucleus composed of protons and neutrons, surrounded by a cloud of negative electrons. It is only

during changes in the condition of an atom that the other three fundamental particles appear on the scene.

The Elements.—The number of chemical elements which could possibly exist used to be quoted as 92. These 92 elements were related in their properties, and presumably in their constitution, for they fitted very satisfactorily into the periodic table of the elements in much the same form as was originally proposed by Dmitri Ivanovich Mendelëff. Some of the 92 elements, indeed, like numbers 85 and 87, had never been isolated and identified beyond doubt, but so beautiful was the regularity in the periodic table that vacant places could be left for them, to be filled later, like seats in a theatre whose occupants have not yet arrived, but for which tickets have been sold. Even after the great discoveries of isotopes and of artificial radioactivity, the number of different possible patterns of chemical behaviour remained at 92, although it was recognized that narrow variations were possible in the structure of individual nuclei whose atoms exhibited identical chemical behaviour. By the end of 1938, some 600 reactions were known in which one kind of nucleus was transformed into another. Thus the nuclear alchemist had approximately that number of different atoms, some stable, but most radioactive, to classify under the 92 chemical behaviour patterns. The radioactivity of an atom does not, of course, affect its chemical behaviour.

Meanwhile, a powerful agent for the production of new nuclei had been made available by the discovery of the neutron by James Chadwick in 1932. It was found by Enrico Fermi and his colleagues in 1934 that very frequently a single neutron could be added to an existing nucleus of an atom to make a new atom of the same chemical species, which was usually unstable. In the cases in which this new nucleus decayed by emitting a negative electron, the final product was an atom whose place was one step farther in the direction of heavy elements than the original atom. For example, a neutron could be added to copper of mass 65 giving copper of mass 66. The latter was unstable, decaying by the emission of a negative electron to zinc of mass 66. Zinc is one step farther from hydrogen, the first element in the periodic table, than copper.

Physicists were thus faced with a momentous question. Could uranium, the heaviest element, be treated in the same way to produce elements heavier than any hitherto known? For a few years after 1937, occasional attempts were made to create new, heavy elements. The quantities of material which could be handled by techniques then known were minute, of the order of a few millionths of a pound. Partly for this reason, and partly on account of other complex phenomena, the interpretation of the results was subject to doubt, and there was some discussion as to whether true transuranic elements were actually produced. Indeed, although Emilio Segré stated in 1939 that “transuranic elements have not yet been observed,” most physicists took his remark to imply that the techniques of separating and identifying these elements had not reached the necessary perfection, but that there was no doubt, on theoretical grounds, that their existence would be demonstrated conclusively in due course.

Before the end of 1940, when scientific committees in several countries were studying the possibility of using nuclear energy for military purposes, two elements heavier than uranium were prepared at the University of California, and some of their properties were known. They were the 93rd and 94th elements. Part of this information was

Table I.—The Fundamental Particles

Particle	Charge e=electron's charge	Mass, at rest proton=1	Nature of Evidence
Proton	+e	1	Decisive

withheld, however, until the publication of *Atomic Energy for Military Purposes* by Henry D. Smyth in 1945. These two new elements were named neptunium and plutonium, after the remote planets. Their positions in a periodic table of the elements are given in Table II. After World

Unit of the mass spectrometer used in isolating the first sample of U-235, a radioactive derivative of uranium. Announcement of this work by Dr. A. O. C. Nier (examining the collection plates of the spectrometer) in Feb. 1940 was followed in the same month by the first appropriations in the U.S. for atomic research

War II it became common knowledge that these elements were produced and separated chemically in considerable quantities during the development of the atomic bomb (*q.v.*). Later, in 1945, Glenn T. Seaborg at the University of Chicago Metallurgical laboratory announced the artificial manufacture and separation of the elements numbered 95 and 96, and demonstrated at the same time that they occurred naturally in minute quantities in certain radioactive ores. They were named americium and curium.

The special properties of transuranic elements were not yet published in 1946, but the four have been included in Table II in groups VII and VIII. For the reason just stated, however, it is not possible to adduce conclusive proof that they are in their correct positions. Some authorities believed that they formed part of a new series of rare earths, called the actinide series, beginning at actinium, number 89. Others regarded protoactinium, number 91, as the first member of this new rare earth group. If either of these points of view was correct, then the arrangement of the heaviest elements in Table II is in need of slight modification.

The four elements are radioactive. Plutonium has isotopes of mass 234, 235, 236, 237, 238 and 239. At least the 239 variety has a long half life.

Fission.—During the four years following the discovery of artificial radioactivity by Irene Curie and Frederick Joliot in 1934, several hundred different radioactive atoms were studied and classified. The majority of such radioactive atoms were formed by bombarding ordinary stable atoms with protons, neutrons, deuterons or other particles. A complete study of a particular process involved many experiments. It was important (1) to measure accurately the energy changes involved, (2) to find out how the yield of new nuclei or of small nuclear fragments varied as the energy of the impinging particles was changed, (3) to study the mode of decay of the artificially produced radioactive element, (4) to identify exactly the final products of reactions and (5) to determine the distribution of energy among the particles emitted during radioactive decay. In addition to providing a proper placing of these artificially radioactive atoms in the periodic table the investigations

The 70,000,000-volt synchrotron atom-smasher built for the U.S. navy in 1946. This machine was first proposed by Prof. V. Veksler, a Russian physicist, and also independently devised by Prof. E. M. McMillan of the University of California, Berkeley, Calif.

gave accurate relative measurements of their masses.

By the end of 1938 it was well established that most stable elements could be converted by some form of particle bombardment into radioactive elements of different chemical type, not more than one or two places removed from the position of the parent in the periodic table. In fact, a too ready acceptance of this process as the only one which could occur somewhat delayed the discovery of nuclear fission. The Germans, Otto Hahn and F. Strassmann, were the first to suspect that earlier interpretations of the disintegration of uranium under the impact of neutrons were at fault, for they proved that an isotope of barium was among the products. Almost immediately afterwards, early in 1939, Lise Meitner and O. R. Frisch in Copenhagen suggested that these experiments revealed a new type of disintegration, one in which the heavy nucleus formed by adding a neutron to uranium decayed by splitting into two approximately equal parts, instead of by emitting an alpha or beta particle in the established manner. From theoretical considerations they were able to give an estimate of the energy liberated per atom. The figure was staggering—200,000,000 electron volts. This is equivalent to saying that if the energy derived from one pound of fuel oil were sufficient to keep a diesel engine operating for one minute then the energy from one pound of uranium, if utilized by the process of fission, would keep the same engine operating for 2,000,000 or

3,000,000 minutes, that is, for five or six years. As events turned out, Meitner and Frisch's estimate was not far from the truth.

This process of fission, as it came to be called, occurred only while uranium was under the impact of a rain of neutrons supplied from a cyclotron or other outside source. But it was at once conjectured by Fermi and somewhat later proved by Leo Szilard and W. H. Zinn that during each fission process a few free neutrons were given out. Since it took only one neutron to initiate a fission, it was clear that, once started in a lump of uranium, the fission-decay process would be made self-perpetuating if at every stage more than one of the new neutrons could be made to initiate another fission.

To some practical scientists who understood these things, there was at once opened a vista of a future civilization based on a cheap and virtually inexhaustible supply of energy; to other scientists there appeared a possibility that the new nuclear energy might be used as an explosive. To the citizen of the world, however, the new knowledge did not come until nuclear energy was used in 1945 as a military weapon. In many people's minds the association of the release of nuclear energy with destruction obscured the possible benefits to be derived from it. A period of education was needed, in which physicists had to play their part, to assure the average individual that the advantages to be derived from the development of nuclear energy far outweigh the possible dangers of its use by an intelligent civilization.

As a result of the fission process, uranium atoms divide into two parts of comparable magnitudes, but not always

in the same way. All the elements in the range 35 (bromine) to 58 (cerium) have been found among the direct products except those numbered 37, 39, 41, 43, 45, 55 and 57. The fragments are all radioactive, decaying directly or by intermediate steps to stable elements. It was estimated that, on the average, 6.3 radioactive disintegrations follow each fission. Although fission can be accomplished by neutrons and by radiation, it is not a general property of elements, being confined to a few at the heavy end of the periodic table. Therefore it was not, to quote H. A. Bethe, a supremely important discovery from the point of view of pure science. It was not, for example, in the same category as the discovery of the neutron, or of the quantum theory of energy-exchange. Yet its practical importance and its impact upon civilization might be very far reaching. The development of atomic bombs (strictly, nuclear bombs, for all chemical bombs are atomic) was merely a technological advance, based upon the discoveries of physics, engineering and chemistry, for the previous half century. Comparatively few discoveries of fundamental scientific importance arose from the atomic bomb project. (See also ATOMIC BOMB.)

Cosmic Rays.—Years of painstaking and patient work on cosmic rays finally earned a magnificent dividend in 1938 by the discovery of the meson or mesotron, a new elementary particle. The cosmic ray particles which reach sea level were known to fall definitely into two classes, those absorbed rather easily by ten metres of water, and others which are much more penetrating. Practically all authorities agreed in identifying the soft component with high energy electrons. A suggestion that the penetrating component consisted of protons had to be abandoned after the tracks of the particles had been photographed and studied in cloud chambers. The curvatures of the tracks in strong magnetic fields and the density of the fog trails which they made could not be fitted into the proton hypothesis, nor did the tracks resemble any which were known to be due to electrons.

It thus became apparent that the penetrating component of cosmic rays included a kind of particle not previously recognized in physics. The first picture taken under conditions which permitted the recognition of the particle's peculiar properties was made by S. H. Neddermeyer and C. D. Anderson at the California Institute of Technology in 1938. This new particle, the meson, as it came to be called, was 180 times as massive as the electron or about one-tenth as massive as the proton. It was an unstable particle, decaying, as E. J. Williams and G. E. Roberts showed experimentally, two or three millionths of a second after its creation, into an electron and a neutrino. The meson was found to carry either a positive or negative charge equivalent to that of the electron.

It was a particle of great interest to theoretical as well as to experimental physicists. A nonscientific reader would have been surprised to learn that some time previous to 1938, the year of the meson's discovery, Hideki Yukawa's theoretical investigations of the structure of the nucleus at Kyoto Imperial university, Japan, led him to postulate a particle like the meson as necessarily existing. Let it be noted that Yukawa had no experimental evidence that mesons existed at the time of his theoretical work. According to his ideas, mesons were a kind of binder which kept the heavy particles in a nucleus in stable equilibrium.

Since mesons were known to have but a transient existence, and yet were found in the cosmic rays reaching the surface of the earth, they must have been created not

very far away. Observations from free balloons which sent down automatic radio signals were made at altitudes of more than 20 miles in the atmosphere. The results showed that the mesons of cosmic rays were created near the fringes of the earth's atmosphere. As they hurtled downwards at various speeds, most of them decayed to electrons and neutrinos, though some reached the earth's surface. The question of the nature of the agents which created the mesons in the high atmosphere was still under discussion. The agents were, of course, primary cosmic rays coming to the earth from outer space. Many investigators believed that these primary rays consisted largely of fast moving protons.

A climax of interest in mesons was reached in 1945 when they were produced artificially. X-rays from the 100,000,000 electron volt (Mev.) betatron of the General Electric company were found to cause mesons to be emitted from many atomic nuclei. Photons of energy less than 60 Mev. were ineffective. In the same series of experiments mesons of unexpectedly low mass were found. Since the masses of the mesons could not be measured accurately, but could only be estimated by indirect means, it was not yet certain whether these new particles had definite masses, like protons and neutrons, or whether they could be manufactured with almost any masses within a limited range. Mesons were not to be regarded as particles having an independent existence in a nucleus before their emission, whether by cosmic rays or by X-rays. They were perhaps thought of as being created by the nucleus at the moment of emission. A meson's mass and kinetic energy therefore represented, in a new form, some of the excess energy of which the unstable nucleus had to rid itself during its adjustment to a more permanent state of equilibrium.

Instruments.—*The Betatron.*—In a paper published in 1941 on the acceleration of electrons by magnetic induction, Donald W. Kerst described a new instrument, the betatron, by which electrons could be accelerated (in 1945) to 100 Mev. The previous limit, attainable by conventional methods, was about 5 Mev. To understand the principle of the betatron, it is necessary to remember that whenever the magnetic flux in a certain space is changing, an electromotive force is set up in a loop of wire surrounding the space. The electric force is present, indeed, whether the wire is there or not. In place of a loop of wire, Kerst set up a ring-shaped vacuum tube containing a source of electrons, between the pole pieces of an electromagnet. As the magnetic flux changed, electrons were accelerated in gradually contracting orbits, inside the ring-shaped tube, until they fell on a target. The magnetic field was not meant to be uniform at any particular instant. It had to vary radially in such a way as to keep the electrons bunched in a thin ring of current. The design of the magnet controlled the success or failure of the instrument. During one revolution each electron was accelerated by an amount equal to the instantaneous voltage generated in its orbit by the changing flux. The electron speeds were so high that 100,000 revolutions were possible in the short time, 0.0004 second, during which the flux was increasing. In the first model of the instrument, described in 1941, the electrons had an average gain of 20 or 30 volts per revolution, giving a total energy of 2.3 Mev. Two later models were built, one reaching 20 Mev., and the third attaining 100 Mev. It was with this last instrument that mesons (see under *Cosmic Rays*, above) were created in the laboratory for the first time in 1945.

Chain-Reaction Pile.—One of the first necessities of the Manhattan Engineer District, the organization responsible

for the technological development of the atomic bomb, was the discovery of a system fed by normal uranium in which the process of fission would be self-perpetuating. The system most likely to be successful was one in which uranium would be interspersed with a material called a moderator which would slow down neutrons but not absorb them. Carbon was the natural choice for a moderator by reason of cost, availability and purity. Fermi and Szilard showed that better results would probably be obtained if the uranium, instead of being uniformly mixed with the carbon, were disposed in lumps here and there in a definite lattice pattern. The success of such a pile constructed at the University of Chicago Metallurgical laboratory in 1942 was described by Smyth in *Atomic Energy for Military Purposes*. During the years 1942-45, larger piles of greater power were built, from which plutonium was extracted for use as an explosive. The first experimental pile at Chicago was initially operated at a power level of $\frac{1}{2}$ watt, later raised to 200 watts. The plutonium production piles apparently developed a power of the order of hundreds of thousands of kilowatts.

A chain reaction pile is radioactive to a degree undreamed of in scientific circles before World War II. It was therefore necessary that it be housed behind thick absorbing walls, usually many feet of concrete, to insure the safety of the operators and experimenters. As a scientific tool the pile became invaluable to nuclear physicists by reason of

its copious production of neutrons. The properties of neutrons could now be studied on an intensity scale which permitted the accurate measurement of effects which were formerly far beyond the range of experiment. For example, neutrons were reflected from crystals in the same fashion as X-rays; a whole new subject of neutron spectroscopy grew up under the secrecy of the Manhattan Engineer District, to be released in part for the information of the main body of scientists almost a year after the cessation of hostilities.

Furthermore, the chain reaction pile could be used to produce unusual isotopes in considerable quantity. Almost any material inserted for a time into the neutron atmosphere in a pile changes partially in its isotopic constitution. Uncommon isotopes are sometimes stable, sometimes radioactive. Both could be used as tracer elements to follow the course of inorganic and organic processes in animate and inanimate matter. The course of radioactive tracer elements could be followed by electrical means; the distribution of stable tracer elements was most conveniently discovered by routine analyses using a mass spectrograph. A new era of rapid discovery in biology and medicine was at hand.

Cyclotron.—It was only within the two preceding decades that physicists grew accustomed to using tools of research built on a large engineering scale rather than as small laboratory models. Electrostatic generators, betatrons, chain reaction piles and cyclotrons bore witness to this trend. A building 160 ft. in diameter was needed to house a University of California cyclotron. The magnet itself was

A betatron based on alternating magnetic forces, and accelerating electrons to energies of 100,000,000 electron volts, was constructed at the General Electric laboratories in Schenectady, N.Y., under the direction of Dr. E. E. Charlton (left) and W. F. Westendorp. Made public in Oct. 1945, the device was expected to increase applications of nuclear physics in medical and industrial research

52 ft. long and weighed between 3,000 and 4,000 tons. Such a structure could not be handled as one unit but had to be built up from steel plates. Even the pole pieces, each 15 ft. in diameter, were laminated. It was designed to produce deuterons of energies in the range 70–100 Mev.

The frequent nuclear disintegration phenomena observed in cloud chamber photographs of cosmic rays made investigators eager to produce in their laboratories charged ions with energies of the same order of magnitude as those possessed by cosmic ray particles. To achieve this end, Edwin M. McMillan proposed a new accelerator called a synchrotron which included some of the features of the cyclotron and some of the betatron. He noticed that because of the relativistic increase of mass with velocity, heavy particles being accelerated in a cyclotron gradually fell out of phase with the high frequency accelerating field between the dees. This condition compelled particles of definite energies, after they had circled many times, to stay in equilibrium orbits from which they could not be removed by the normal operation of the cyclotron. All that was necessary to accelerate this group of particles to much higher energies was to change the main magnetic field or to vary continuously the frequency of the accelerating voltage between the dees. For ions like deuterons or alpha particles the frequency changing device was the more appropriate. McMillan believed that there was a possibility of reaching energies in the 1,000,000,000-volt range. The synchrotron could not, of course, provide a steady current of ions, but only a succession of strong pulses.

Electron Microscope.—There is in optics an inviolable rule that a microscope cannot show any detail which is of smaller dimensions than about one wavelength of the light by which the detail is examined. The useful magnification of an optical microscope is therefore limited to about 2,000. X-rays, although they have wave lengths several thousand times shorter than visible light, cannot be used because no convenient ways are known of refracting and focussing them to make recognizable images. The wave lengths of moving electrons, however, are comparable to common X-ray wave lengths when the electrons have energies greater than a few hundred electron volts. Theoretically, then, electrons can be used in place of ordinary light in the operation of a microscope and a resolving power should be attainable far in excess of that of an optical microscope. After a few years of development, the electron microscope emerged from the state of being a scientific curiosity into being a powerful tool with immediate applications in nearly all phases of physical and biological science. In such a microscope the image was produced by a beam of electrons which passed through the specimen just as light passes through an ordinary microscope slide. The specimen had to be very thin. The thicker parts of it deflected more electrons from the beam than the thinner parts. Carefully designed coils carrying steady currents then acted as lenses for the beam (which carried the pattern of the specimen) and focussed the beam into an enlarged image on a photographic plate. So close was the analogy between the behaviour of light and of electrons that much of the optical theory required little modification to make it fit the electrical case. Similar instruments using electrostatic in place of electromagnetic lenses were also constructed.

An important advance in electron microscope technique was made in 1944 by Robley C. Williams and Ralph W. G. Wyckoff. The former, an astronomer, was well aware of the technique of estimating the heights of mountains on the moon from the obliquity of the incident sunlight and

the length of the resulting shadows. Shadows were therefore intentionally cast on specimens prepared for the electron microscope not by light, but by evaporated metal atoms. The parts coated with metal were stronger absorbers and deflectors of electrons than the uncoated or shadow parts. Photographs reproduced this contrast in such a way as to give the impression of true optical shadows. With this technique it became possible to estimate the sizes of objects about one-ten-millionth of an inch in diameter—in the range of the dimensions of molecules. Large molecules and some of their structural features were seen for the first time.

Klystron and Magnetron.—Although the general properties of electromagnetic radiation in the frequency range between radio and the infra-red were well known before, it was not until 1938 that an efficient generator of such radiation was devised. In that year a description of the klystron oscillator was published by W. W. Hansen. In his klystron oscillator a beam of electrons was sent through a pair of grids between which a small oscillating field was maintained. The emergent beam therefore consisted essentially of a fluctuating electron current. When this particular electron beam was sent through another pair of grids, a considerable fraction of the power originally supplied could be withdrawn in the form of high frequency radiation, with a frequency of the order of 500 megacycles per second. The efficiency was remarkably high, in the neighbourhood of 40%. The invention of such an efficient source of high frequency radiation made radar an instrument of practical application in navigation and war.

Even radar installations using frequencies of the order of 500 megacycles were somewhat bulky, since the dimensions of the apparatus had to be several radiated wave lengths. For equipment to be used on small craft and aeroplanes shorter wave lengths still were needed. A device for generating satisfactory amounts of power in the microwave region was developed in England at the University of Birmingham (by M. L. Oliphant, it is said) in 1940. This was the cavity magnetron, an efficient generator up to frequencies of the order of 9,000 megacycles (3 cm. waves). The basic principle of its operation was simple. Everyone knows that when air is blown across the mouth of an empty bottle a considerable sound is emitted, its frequency being controlled by the size of the bottle or cavity. Similarly, when electric charges (*i.e.*, electrons) were sent, in a vacuum, very quickly across a small slit leading to a metallic cavity, electromagnetic oscillations characteristic of the size of the cavity were set up. The magnetic field by which the moving electrons were controlled gave rise to the name magnetron. Magnetrons, indeed, had been used as experimental laboratory devices for some years previously; magnetrons with resonant cavities changed the pattern of warfare by reducing the bulkiness of radar equipment. Cavity magnetrons were capable of producing higher frequency oscillations than klystrons. Therefore they used correspondingly smaller antennas. The cavity magnetron was built to give a peak output for a few millionths of a second up to 1,500 kilowatts. As scientific instruments both represented improvements over previous devices to the same extent as a searchlight outshines a pocket flashlight. (See also RADAR.)

Mass Spectrograph.—The use of uncommon isotopes as tracer elements to follow the courses of chemical reactions in complex systems like plants and animals was formerly restricted to radioactive isotopes whose presence was detected by their radiations, and to heavy hydrogen which, in sufficient concentration, could be estimated by density determinations. By 1944 the mass spectrograph was developed

in such a way that it could be used for routine analyses, each run occupying much less than an hour. Consequently, rare isotopes like carbon 13 which is not radioactive could be used as tracers. Carbon in convenient form containing a known proportion of carbon 13 was introduced into a system perhaps in the form of food. At any subsequent time its distribution could be determined by converting any small chosen part of the system to carbon dioxide which was fed into the mass spectrograph. The instrument recorded the proportions of the various carbon isotopes which were present. The migration of the original carbon introduced into the system could thus be followed easily. Damage to delicate organisms which might be caused by radioactive tracers was avoided.

Physics and World War II.—Since World War II was a physicists' war in the same sense that World War I was a chemists', all the major belligerent powers mobilized their scientific manpower and resources to some extent for military purposes. Curiosity regarding the enemy's progress in scientific warfare could be satisfied only by the frequency of appearance of new and effective weapons and by reports of the intelligence services. The extent to which science was organized for warfare in different countries naturally depended on the national point of view regarding science. Since no two nations looked at this matter in the same light, the attitudes adopted by a few of the major powers are described separately.

Germany.—Quoting from a statement by S. A. Goudsmit, the course of German science during the years 1937-46 can be said to have been determined by three factors. First, the esteem for bona fide science and scientists declined rapidly during the nazi regime, while men of inferior ability, presumably good party men, rose in power. Second, the German government expected the war to be won in a short time and initially did not mobilize science for the war effort. Third, the broad fundamental training of German engineers eliminated to some extent the need for academic scientists' participation in wartime applied science. At the start of the war scientists within the age limits set for military service were called to the colours. There was at first little co-ordination among the competent research staffs of the various branches of the armed forces and important industries. The industrial laboratories were the least dominated by the nazi influence and were occasionally able to employ scientists who would have been barred from government laboratories. It was mainly from the industrial laboratories and from government sponsored laboratories that the major scientific accomplishments came. In heavy rocket-propelled devices, Germany was ahead of the rest of the world.

Two groups, one under Werner Heisenberg, at the Kaiser Wilhelm Institute for Physics, the other under Erich Schumann at the Army Ordnance Research department, made a serious attack on the problem of releasing nuclear energy from uranium. Although hampered by lack of co-ordination among different laboratories, by interference from high government officials, and by a lack of co-operation among administrative (as distinct from scientific) leaders, the German scientists believed that they were ahead of the United Nations in the uranium problem. That belief continued after the capitulation of Germany, and was shattered only when news reached Europe of the explosion of an atomic bomb over Hiroshima.

Great Britain and Canada.—Great Britain had for many years maintained a government-supported department of scientific and industrial research, whose function had been to encourage fundamental research and its important developments by subsidizing scientists ranging from graduate

Cyclotron at the University of California at Berkeley, as it neared completion in 1946. Work on the machine was begun in 1940 and interrupted by the war

students to directors of laboratories. A natural basis for co-operation was therefore at hand to link the efforts of academic and industrial scientists and engineers. At first it was necessary to put the major effort on devices of defense, particularly against aircraft and submarines, but after two or three years of warfare the emphasis was shifted in the direction of offensive devices. Before the end of the war, in the face of the German robot bombs, a partial reverse shift appeared to be necessary.

The groundwork for mutually beneficial co-operation between Great Britain, Canada and the United States was already laid before the United States took an active part in hostilities. Microwave radar centring round a British invention was developed primarily in the U.S. Many British scientists joined the Canadian group near Montreal to work in collaboration with the Manhattan Engineer District on the development of the nuclear bomb. Much secret information was exchanged to the advantage of the three participating countries, for many of the difficulties met and overcome by one country were later encountered by another.

Japan.—Only occasional items were printed concerning science in Japan during the war years. The sums allocated for scientific research with the object of developing new weapons were pitifully meagre by western standards. Apparently it was quicker and more feasible to train men in suicide tactics with existing weapons, both in the air and under water, than to develop new ones. In radar the Japanese lagged far behind the United Nations; there was no very serious work on the uranium problem although there were men with the ability to direct it. It was reported that when the first atomic bomb was released, a communication was dropped and retrieved by the Japanese military authorities which suggested the names of one or more physi-

cists who would, by their previous training and world-wide prestige, be in a position to estimate with some accuracy the general features of the new bomb. Later, according to the story, it was discovered that the scientists concerned had not been contacted, or were not given the information until after the occupation of Japan by the U.S. army. If the report was based on fact, one of two conclusions can be drawn; either the country was in a state so disorganized that the military authorities could not get in touch with leading scientists, or else the prestige of Japanese physicists in the eyes of the military leaders was not as great as in the eyes of scientists of other nationalities. Japan had several internationally known schools of physics research before 1941. They suffered a temporary setback by the regrettable destruction by the U.S. army in 1945 of a cyclotron, an instrument devoted entirely to fundamental research.

U.S.S.R.—Peter Kapitza, probably the foremost Russian physicist and certainly the best known in foreign countries, gave a report in 1943 which may be taken to describe the official attitude of his country toward fundamental research, and outlined desirable goals and types of organization. He felt definitely that the organizational forms of scientific work accepted in the west could not be applied unchanged in the U.S.S.R., principally because of the socialist nature of the country. The rather accidental and spontaneous character of science in Anglo-Saxon countries was out of place in the soviet union, where a more purposeful guidance was necessary. He said he believed that the function of the Academy of Sciences was to direct through its institutes all fundamental science in the U.S.S.R., ideologically, from top to bottom, along a sound channel. Kapitza emphasized that a scientific leader must not be a man who spends most of his time at a desk engaged in administrative work, but one who is constantly in the laboratory, actively participating in the work of research; and that to use the time of highly trained personnel to the best advantage it was necessary to provide them with adequate though less highly trained assistants. How well this policy was borne out in practice may be judged from a report that in the science institutes of the U.S.S.R. only 25% of the personnel were highly trained scientists.

In spite of, or perhaps because of, the responsibility assumed by the Academy of Sciences in guiding fundamental research, it appeared to British visitors to Russian laboratories that the physical problems engaging the attention of investigators there were just those which were of greatest current interest to able scientists all over the world. Nuclear research and the physics of solids occupied a prominent place. The beginnings of Kapitza's own special field of research, that of magnetic effects at extremely low temperatures, were laid while he worked in Lord Ernest Rutherford's laboratory in England. In theoretical physics the work of J. E. Frenkel influenced many branches of research, including that on crystals under the direction of Abraham F. Joffé.

United States.—With the example before them of the useful contribution which British physicists made to military science, Americans were unusually well prepared for a co-operative war effort which would include the mobilization of scientists. This was done on a voluntary basis, through the Office of Scientific Research and Development, headed by Vannevar Bush. Gradually the co-ordination between the groups working under this title and the military authorities improved until it was smoother and much more effective than in Germany and Japan, and at least as pro-

ductive as in the U.S.S.R. and in Great Britain. In an analysis of the operations of the Office of Scientific Research and Development, published under the title "The Great Science Debate" in *Fortune*, June 1946, three points were emphasized:

(1) It became clear very soon that there were grave deficiencies not only in the military and industrial research of the U.S., but also in the fundamental research of the country. That these deficiencies were made good in time to contribute to the ultimate victory of the United Nations was due to a combination of lavish expenditure of funds and of heroic efforts. (2) The major wartime achievements were in applied physics, although some discoveries of fundamental importance emerged as side-issues. (3) Almost any problem could be solved if enough effort was directed towards it, with the result that the difficulty of the future was diagnosed as one of knowing which are the most important problems to be solved, rather than of knowing how to solve particular problems. Urgent work was pushed to completion because of the versatility of men trained in fundamental science. Biologists became physicists, chemists became engineers, and physicists turned their hands and heads to research in a dozen different fields. Like a skillful artisan who could quickly learn a new trade, a competent research worker was soon at home in a new profession. This intermingling of specialties contributed notably to the successful co-operation which characterized the U.S. scientific war effort.

As I. I. Rabi, 1944 Nobel prize winner in physics, put it, physicists were placed in an embarrassing position by the very success of their efforts in the war. The embarrassment arose from the fact that during the war years, the progress of physics was less than moderate, while technology advanced by leaps and bounds. The inheritance of technology was, in a few years, exploited to the point where further substantial progress could come only from further advances in physics.

The country's greatest mistake, not made in most other countries, was the enrolment in the armed forces of young potential scientists. The U.S. was faced for nearly a decade with an acute shortage of trained scientific personnel. (See also CHEMISTRY.)

Physiology

Perhaps the most fundamental trend revealed by a study of the progress in physiological science during the decade 1937–46 was the interrelationship and interdependence of all the sciences, physical, biological and social. Techniques, materials and concepts developed in one branch of science find unsuspected usefulness when applied to another apparently unrelated branch.

Physiological Psychology.—In a series of noteworthy experiments C. P. Richter demonstrated that rats manifest specific "hungers" for substances of which they are in need. He found that after removal of the adrenal gland, sodium passed out into the urine in excessively large amounts, thus producing profound changes in the body chemistry which result in grave symptoms and finally death. However, when given access to sodium chloride, adrenalectomized animals ingested sufficiently large amounts to keep themselves alive and free from symptoms of insufficiency. Transection of the nerves subserving the taste sensation resulted in loss of this self-regulatory ability, indicating that the selection of

salt was not merely on the basis of trial and error with subsequent learning that salt alleviated the symptoms. Furthermore, rats which were adrenalectomized were able to detect salt solutions of very low concentration which normal rats could not distinguish from water.

Very instructive experiments were conducted by R. T. Bellows on the water drinking habits of dogs with fistulas of the oesophagus which prevented the ingested water from reaching the stomach. These studies revealed that when such an animal had been deprived of water for a certain number of hours and had thus established a certain water deficit, it would drink an amount of water roughly proportional to the degree of the deficit. This indicated that entry of water into the stomach and subsequent absorption was not necessary in gauging the amount of water needed by the animal.

Such studies as the two mentioned above revealed that many of the concepts formerly held concerning the physiological basis for basic aspects of behaviour such as food-getting and sex behaviour were narrow and inadequate. The co-operation of the physiologist and the psychologist promised to establish a true science of the biological bases of behaviour.

Application of Physics to Physiology.—The revolutionary advances in physics during the decade provided many important materials and methods for use in physiological research. The production of isotopes of elements found immediate and extensive application in the study of physiological processes. These isotopes represented a form of chemical elements which reacted just as the corresponding natural elements did in the animal body, but which possessed the unique advantage that they could be detected and measured at any stage in their progress through the organism. This detection was possible by reason of the fact that the isotopes, although chemically and therefore physiologically identical with the naturally occurring elements, had different atomic weights and, in some instances, possessed radioactivity. Thus, by either measuring the atomic weight of the element in question or by detecting the radioactive emanations, the location and concentration in the body tissues and fluids of the organism could be determined. Many studies of this type were performed; the results of only a few can be related here.

Perhaps the most significant conclusion to be drawn from these studies is that most of the tissues of the body are constantly participating in chemical exchanges even under conditions in which their average composition remains constant. For example, when isotopically "labelled" fat is fed to a normal animal, it becomes thoroughly intermingled with the fat already stored in the body to the extent that many of the fatty acids of the fed fat replace the fatty acids in the molecules of stored fat, even though the total amount of fat in the body and its average chemical composition did not change. Similar relationships exist for other foodstuffs and minerals.

The chemical reactions which various foods and chemicals undergo in the body can be studied to advantage by means of isotopic "tracers." Thus, it was demonstrated that carbon dioxide, formerly considered to be only an end product of oxidation in the body, can be utilized in the synthesis of certain body constituents.

The fact that certain elements show a great affinity for one specific tissue in the body offers a means of producing highly concentrated intracellular radiation effects when the element in question is administered in radioactive form. Advantage was taken of this principle in the treatment of hyperthyroidism with a radioactive isotope of iodine. Most of the administered iodine is taken up by the cells of the

thyroid gland, and the radioactive emanations depress the secretory activity of these gland cells which have been producing an excessive amount of their product.

Much new knowledge regarding the biological effects of radiant energy was gained during the decade. The effects of exposure of living organisms to all the new types of radiation encountered in connection with nuclear reactions of atoms were intensively studied. The possibility of applying the neutron rays generated by the cyclotron to the treatment of cancer received encouraging support.

The most important form of biologically active radiant energy to which most persons are exposed is the ultraviolet radiation in sunlight. Certain chemical substances known to be present in all living cells show a high capacity to absorb ultraviolet light, and it is upon these cell constituents that the primary effects are exerted. Ultra-violet light was found to produce a variety of effects on living organisms, depending upon the susceptibility of the organism to the intensity, duration and frequency of exposure. Increase in the frequency with which hereditary genetic mutations occur was shown to be a prominent effect of ultra-violet irradiation. It was shown that in general the effect of ultra-violet radiation on living cells is destructive, but when the degree of injury is slight, stimulation of the activity of the cells may result from the liberation of stimulatory substances from the injured cells. Evidence converged from a number of sources to indict the ultra-violet radiation of sunlight as a major factor in human cutaneous cancer. Experimentally, cutaneous cancer was consistently observed in animals exposed to adequate amounts of ultra-violet radiation.

Physiology of Nerve and Muscle.—The application of electrical methods to the study of nerve and muscle continued to yield valuable information. Although the controversy concerning whether nervous impulses are transmitted by electrical impulses or by chemical substances was not completely resolved, a clearer picture of the interrelationship between these two types of phenomena evolved.

The electrical activity of the brain was widely investigated, and studies of "brain waves" or electroencephalograms showed that persons with certain diseases such as epilepsy and traumatic brain injury had abnormal patterns.

It was shown that the anterior horn cells or motor neurons of the spinal cord do not send out impulses unless they are activated by the stimulus of arriving nerve impulses. In the central nervous system it was demonstrated that the central excitatory state or the increased sensitivity of a nerve cell which follows a previous stimulation was a dynamic phenomenon caused by persistence of the impulse passing through local nerve cells.

Much study was devoted to the substances which are released at the ends of nerves and which influence the next nerve cell or gland or muscle to which the nerve leads. It was demonstrated that acetylcholine is released not only at parasympathetic nerve endings but also at nerve endings in the central nervous system, at the junction, or synapse, connecting one relay with the next and even at the termination of nerve fibres on skeletal muscle cells. An enzyme cholinesterase, capable of splitting and inactivating the acetylcholine, was found present in high concentration in all these locations where acetylcholine is set free, and the rapid destruction of the acetylcholine by cholinesterase accounts for the short duration of the effect of a single nerve impulse.

The exact physiological alterations that skeletal muscle

undergoes when it is deprived of its nerve supply were investigated by many researchers. It was discovered that denervated muscle when properly stimulated electrically could be made to undergo a true tetanic contraction similar in every respect to that of normal muscle. It was conclusively proved that stimulation of this type during denervation prevented to a large degree the atrophy which usually occurs in muscle separated from its nervous supply. This principle was applied to the treatment of patients with various types of nerve lesions.

Respiration.—Because of the importance of respiration in aviation physiology, this field commanded a great deal of attention during World War II. Exact data on oxygen consumption, respiratory volume, the exchange of gases between the blood and the air in the alveoli of the lungs, the rate of blood flow through the lungs, and the concentration of various gases in the blood were obtained. The oxygen requirement of aviators at various altitudes and under various circumstances were determined, and excellent equipment was designed to supply these needs.

One of the classical problems in physiology was the search for a single chemical substance exerting absolute control over the activity of the respiratory centre in the brain. Many different substances had been invoked to fill this place, but each in turn had been shown to be out of accord with the facts in one or another respect. By rejecting the principle that a unique chemical agent is solely responsible for respiratory control and replacing it with the concept that a number of agents exert independent effects, a very valuable theoretical analysis of the factors controlling respiration was achieved. J. S. Gray's "multiple factor theory of respiration" postulated that respiratory activity at any given moment is determined by the sum of the partial effects of the separate agents. Exact mathematical formation of this theory proved to be in good accord with known facts and was useful in solving such problems as oxygen requirement at various altitudes and the effect on respiration of various disturbances of acid-base balance of the blood.

The Eye.—One of the most fundamental problems of physiology concerns the exchange of energy between the environment and the specialized receptors of sensation. Quantitative studies of these energy relations can be particularly well studied in the eye because of the extensive knowledge of photochemical reactions, which are the first step in the translation of the stimulus of light into nervous action. S. Hecht and co-workers measured the energy of a flash of light which could just be seen by a completely dark adapted human subject. The corrected value for the threshold energy absorbed by the rods was 5 to 14 quanta. It was concluded that a single quantum of light which can activate one molecule of visual purple is sufficient to excite a single rod cell of the retina; about six rod cells must be excited to elicit a threshold effect.

The retinal mechanisms concerned with colour vision were explored by R. Granit, who recorded the activity of retinal neurones in the eyes of various vertebrates with the aid of a microelectrode. In this way the activity of individual retinal ganglion cells could be discerned clearly. These electrophysiological studies of the action potentials of retinal neurones revealed that the retina contains "dominators" responsible for the white sensation and a number of "modulators" responsible for colour sensation. Although the modulators tended to fall into three groups corresponding to the three primary colours, it was clearly demonstrated that there was more than one type of modulator

for each primary colour. Consequently, theories of colour vision based upon the classical concept of three primary colours with one type of receptor for each colour could only give an approximate description of physiological events.

Hormones.—A number of the many factors in the anterior pituitary were highly purified, and their actions were carefully studied. The study of purified preparations revealed that the luteinizing hormone and the interstitial cell stimulating hormone are identical. The growth hormone was also obtained in very pure form, and it was shown to have certain diabetogenic effects. The adrenocorticotrophic hormone was also obtained in pure form. The thyrotrophic principle of the anterior pituitary was shown to be capable of producing exophthalmos in experimental animals, thus strongly indicating the presence of this hormone in excess in patients manifesting this symptom.

Isolation and synthesis of adrenal cortical steroids made great progress during the decade. It was clearly demonstrated that there are two groups of cortical hormones, one concerned with carbohydrate, fat and protein metabolism. Overactivity of the adrenal cortex or administration of cortical hormone was demonstrated to be capable of producing a degeneration of lymphoid tissue throughout the body with a concomitant rise in the gamma globulin fraction of the blood and the immune bodies associated with this plasmoprotein fraction. This lent strong support to the view that lymphatic tissue is a site of formation of antibodies.

A new principle in the study of hormone functions was introduced with the discovery of a group of compounds, of which thiouracil was the outstanding example, which could depress the function of the thyroid gland by interfering with the synthesis of the thyroid hormone. These substances did not interfere with the action of the thyroid hormone when the latter was given in a preformed state. These compounds found extensive use in the treatment of patients with hyperthyroidism.

A somewhat similar development was the discovery that the chemical alloxan and certain related chemical substances have a highly selective lethal action upon the B-cells of the islands of Langerhans of the pancreas, the cells which elaborate insulin. This provided a valuable experimental tool for the production of diabetes without operating upon or causing other injury to the animal. A single injection of this material into the experimental animal produced irreversible damage to the islet cells within a few minutes and resulted in permanent diabetes. In certain cases these animals manifested acidosis, ketosis, diabetic coma and cataracts, complications of diabetes frequently encountered in the human diabetic patient.

Intersexuality or hermaphroditism was produced experimentally by the administration of sex hormones to pregnant animals.

The Kidney and Hypertension.—Following the demonstration by H. Goldblatt that a persistent elevation of blood pressure could be produced in animals by interfering with the blood supply to the kidneys, much effort was directed toward the elucidation of the mechanism of this phenomenon. Since it was known that removal of both kidneys, although it results in fatal uremia, does not lead to the development of hypertension, it was reasoned that the hypertension produced by constriction of the renal artery must be due to some effect of impaired circulation in the kidney and not to lack of kidney function. When it was shown that severance of all possible nervous connections between the kidney and the blood vessels did not

prevent the high blood pressure from developing, it was concluded that a chemical substance of renal origin, circulating in the blood stream, was the cause of the rise in blood pressure. It was discovered that the kidney whose circulation had been embarrassed gave off an enzyme, renin, into the blood stream which acted upon one of the proteins of the blood plasma, hypertensinogen, or angiotonin. This latter substance caused the muscular walls of the small arteries or arterioles to contract and thus raised the blood pressure. The possibility that such a mechanism might operate in certain cases of human hypertension was actively investigated during the decade. By the use of experimentally induced renal hypertension, several promising methods of treatment of the condition were discovered. Both the parenteral administration of kidney extracts and the oral administration of certain oxidized marine oils were found to reduce the blood pressure of animals rendered experimentally hypertensive. The possibility of applying to the human disease the knowledge gained in the study of the mechanism and the treatment of experimental hypertension also received intensive study.

Acid-Base Balance and the Kidney.—One of the most important functions performed by the kidney is its role in preserving the proper ratio between acids and bases in the blood by excreting these components when they are present in excess. One of the means by which the kidney deals with excess acid in the blood is the formation of ammonia to neutralize the acid and the excretion of the ammonia-acid compound. The mechanism of this ammonia formation was determined. D. D. Van Slyke demonstrated that most of the urinary ammonia is formed in the kidney by the enzymatic cleavage of glutamine, an altered end product of protein digestion.

Another means by which the kidney rids the blood of excess acid is the direct excretion of this acid by the renal tubules. R. F. Pitts showed that this is accomplished in the distal portion of the renal tubule where hydrogen ions are formed intracellularly from carbonic acid which in turn arises from the combination of carbon dioxide, a by-product of cell respiration and water. The hydrogen ions are exchanged for sodium ions of the glomerular filtrate across the cell membrane.

Vitamin K.—The discovery of vitamin K was one of the great scientific events of the decade. Seeking the isolation of the dietary factor which causes haemorrhagic disease in chicks, chemists in various countries finally isolated and synthesized vitamin K. This vitamin was found to be present in a wide variety of food substances and also to be synthesized by intestinal bacteria. Vitamin K is not absorbed in the absence of bile from the intestine. After absorption, vitamin K acts in the liver, where it is essential for the formation of prothrombin, a blood proenzyme essential for the clotting mechanism. In jaundiced patients in whom bile is not present in the intestine, a deficiency of prothrombin with marked tendency toward haemorrhage occurs. Treatment with vitamin K corrects the bleeding tendency. When the liver is so severely damaged that it can no longer utilize vitamin K in the synthesis of prothrombin, a haemorrhagic tendency unresponsive to vitamin K therapy ensues.

Folic Acid and Thymine in Pernicious Anaemia.—The isolation of a substance known to be necessary for the growth of certain bacteria provided a crystalline synthetic chemical effective in the treatment of human pernicious anaemia. It was found that certain bacteria required a component of the vitamin B complex, formerly unidentified, for their growth. This substance was isolated in crystalline form from liver extract and was designated *Lacto-*

bacillus casei factor or folic acid. It was then found that this bacterial growth factor was also effective in the treatment of a nutritional anaemia of chicks. This suggested that it might be effective in human pernicious anaemia. When the substance had been synthesized, clinical trials in patients with pernicious anaemia and other types of macrocytic anaemia such as that encountered in sprue and the macrocytic anaemia of pregnancy showed it to be fully effective in producing remissions. Since thymine, a nucleic acid derivative, had been shown to be able to replace folic acid for sustaining bacterial growth, it too was tried in the treatment of human macrocytic anaemia and was found to be effective. Thymine must be used in much larger doses than folic acid, and it was suggested that folic acid is required for the synthesis of thymine in the animal body.

Digestive Tract.—Much new information on the role of hormones in the control of the functions of the gastrointestinal tract was gained. A new gastrointestinal hormone was described by A. A. Harper and H. S. Raper and its existence was confirmed. This hormone, pancreozymin, causes an increase in the output of pancreatic enzymes without affecting the volume of pancreatic juice secreted. Pancreozymin, like secretin which stimulates the production of water and salts by the pancreas, is derived from the mucosal lining of the upper small intestine. By suitable chemical procedure, separation of the two hormones into individual fractions was accomplished.

The Brunner's glands of the duodenum, which lie beneath the mucosa of the first portion of the small intestine, were shown to be under hormonal control. When a meal is fed to an animal in which the Brunner's glands have been separated from nervous connections by transplanting this region of the intestine to the skin, the glands secrete in response to the meal; likewise, injection of extracts prepared from the upper intestinal mucosa provoke secretion. These glands secrete an alkaline mucoid fluid and serve to protect the lining of the duodenum from the destructive action of the acid chyme entering the duodenum from the stomach.

Enterogastrone, the hormone which inhibits gastric secretion when fat is in the intestine, was purified from intestinal extracts. A gastric-secretory inhibitory substance was also found in canine and human urine and was termed urogastrone. Both urogastrone and enterogastrone concentrates were found to be effective in preventing experimental peptic ulcer in dogs, but the beneficial effect of treatment with these materials could not be ascribed to their gastric secretory depressing power. The remarkable feature of this mode of therapy, distinguishing it from previously employed means of treatment, is that after administration of the extracts had been discontinued the animals did not develop ulcer but manifested a prolonged "immunity" toward ulcer development. Preliminary trials in human ulcer patients yielded encouraging results.

Function of the Frontal Lobes of the Brain.—The introduction of the surgical treatment of psychosis by separating the tracts which connect the frontal lobes to the rest of the brain afforded an unusual opportunity to observe the alterations in behaviour wrought by this procedure and thereby to deduce the normal function of these important areas of the human brain. Such studies revealed that the absence of the frontal lobes produces personality defects which, in spite of their obvious importance, resist accurate objective description. The most fundamental defect appears to be an imperfection in perception or the association of sensations. This is manifested by distracti-

bility, poor judgment of time, slower response to stimuli and inability to shift from one perception to another. Information of this kind is of basic importance for an understanding of the physiological basis of personality structure.

Piazza, Adeodato Giovanni

Cardinal Piazza (1874-), Italian Catholic prelate, was born Sept. 30, 1874, at Vigo di Cadore near Belluno, Italy. He was a member of the order of the Discalced Carmelites and served in World War I from 1915 to 1918 as a military chaplain on the Italian front. He was decorated for valour following the armistice. He was appointed archbishop of Benevento in 1930, and was elected patriarch of Venice in 1935. He was created cardinal at the consistory of Dec. 13, 1937.

P.I.C.A.O. (Provisional International Civil Aviation Organization)

See INTERNATIONAL ORGANIZATIONS; UNITED NATIONS.

Pierlot, Hubert

Pierlot (1883-), Belgian statesman, held many important cabinet posts in the Belgian government from 1934 to 1939. In February of the latter year, he became prime minister and in May 1940, the German invasion forced him to move his government to France. After the collapse of the French armies, Pierlot and his government fled to Spain and thence to London, where they set themselves up as the Belgian government in exile. Originally, Pierlot condemned King Leopold's surrender to the Germans, May 28, 1940, but later revised this judgment, declaring that Leopold was not collaborating with the Germans.

After four years of exile, Pierlot and his government flew back to Brussels on Sept. 7, 1944; shortly thereafter he resigned and formed a new government. Unable to cope with the economic difficulties and popular unrest in Belgium, Pierlot, in an address before parliament, blamed the Allies for Belgium's plight.

Hostility greeted his statement and the following day

(Feb. 7, 1945) he handed in his resignation.

Pittman, Key

Pittman (1872-1940), U.S. senator, was born in Vicksburg, Miss., Sept. 19, 1872, and received his education from private tutors and in the Southwestern Presbyterian university at Clarksville, Tenn. He began the practice of law in Seattle, Wash., in 1892. In 1897 he went to Alaska, worked as a miner for two years and became first district attorney of Nome, in which office he fought to protect the rights of miners. In 1901 he left Alaska and settled in Tonopah, Nev., where he again practised law. He was elected to the U.S. senate in 1912 to fill an unexpired term and was re-elected five times, the last in 1940. He became chairman of the committee on foreign relations in 1933. Opposed to U.S. participation in foreign wars, he nevertheless believed that the nation should not isolate itself completely from the rest of the world. As a delegate to the London Economic conference in 1933 he obtained an agreement for stabilizing the production and the price of silver.

At the time of his death in Reno, Nev., Nov. 10, 1940, he was president *pro tem* of the senate.

Pittsburgh

During World War II there was no great influx of new industries in Pittsburgh, Pa.; there was, however, prompt conversion and expansion of existing establishments. In coal, iron and steel, electrical manufacturing, and in transportation, new statistical records reflected the contribution of the district to Allied arms.

As the decade 1937-46 ended, reconversion to peace had been completed.

Western Pennsylvania produces roughly one-fourth of the U.S. total of bituminous coal, of pig iron and of steel ingots. It is significant, in appraising its contribution to war production, that the region's industry was already geared high before Pearl Harbor. Although in 1939 it had not fully kept pace with the country in recovery from the paralysis of 1932-33, the uprush in 1940-41 was somewhat more vigorous in the district than it was nationally.

Factory operations continued at high levels until war contracts were cut back, although the gains after 1941 were somewhat less pronounced than those for the country as a whole.

The increase in total number of wage earners employed, as shown by the employment index of the University of Pittsburgh, roughly paralleled the gain in total civilian nonagricultural employment as estimated by the United

States bureau of labour statistics. There were four major interruptions to economic activity during the period, associated with the coal strikes of 1939 and 1941, the recession of early 1940 during the quiescent period of the war in Europe, and the prolonged steel, electrical and coal strikes in the early months of 1946.

From 1937 to 1944, the seasonally-adjusted monthly index of production (manufacturing and mining) in the district, as computed by the bureau of business research of the University of Pittsburgh, ranged, in terms of percentage of the 1935-39 average, from 56 for June 1938, to 196 for May 1944. In the months from Jan. 1945 to July 1946, inclusive, the range was from 187 for March 1945 to 94 for May 1946. In the general index, inclusive of production, trade and shipments, the range was less extreme than that of the production index but was nevertheless very wide.

In 1941, for the first time in 130 years, a United States war vessel was launched in greater Pittsburgh. A total of 298 ships subsequently were delivered to the navy, of which 264 were L.S.T.s (landing ships tanks). Largest new wartime industrial development was a \$50,000,000 plant for production of synthetic rubber chemicals.

Rail transportation was supplemented by increased tonnage on the three rivers which had historically made Pittsburgh the "gateway to the west." This water-borne freight in the United States army's Pittsburgh engineer district reached a peak of nearly 40,000,000 tons in 1942, about 85% of which was carried on the heavily-industrialized Monongahela.

Advance in air transportation was assured, as the decade ended, by a people's bond issue in Allegheny county of \$6,000,000 for the completion and extension of a new 1,600-ac. airport upon which \$5,500,000 had already been expended for the U.S. army during the war.

Completion in 1940 of the 160-mi. \$70,000,000 high-speed Pennsylvania turnpike to its western junction with U.S. route 30 at Irwin, 20 mi. east of Pittsburgh, greatly increased highway capacity over the Allegheny mountains to the eastern seaboard.

Two notable bank mergers in 1946 affected a closer knitting of the city's financial resources. The larger of these created the Mellon National Bank and Trust company with total resources of \$1,140,000,000 and deposits of \$980,866,000.

Scientific research and development were advanced by expansion of industrial and educational laboratories. Industrial research increased twofold, and research on the fundamental structure and properties of matter, not related to any specific application, was undertaken on a scale far beyond that of any former period. In this latter development the University of Pittsburgh and Carnegie Institute of Technology had a leading part, enlarging their staffs for the growing programs. The university created a new division of research in the natural sciences. At the institute, in 1945, Dr. Otto Stern received the Nobel award in physics. During the war both institutions contributed to work of the Office of Scientific Research and Development. As an outgrowth of earlier nuclear studies, Westinghouse scientists participated, for the Manhattan project, in the development of practical means for separating uranium isotopes. Significant contributions also were made by this laboratory in the development of radar and other electronic devices. The aluminum industry was revolutionized for large-scale production by the development of the Alcoa direct-chill continuous-casting process, permitting production of ingots weighing up to 5,000 pounds or more; and important new alloys were developed.

Industrial laboratories in the oil and steel industries were notably expanded. Mellon institute, outstanding laboratory for industrial research, dedicated a monumental new building in 1937, the gift of Andrew W. and Richard B. Mellon. During the decade it conducted more than 200 separate research undertakings and enlarged its program of pure research. Pittsburgh's scientific leadership was highlighted in 1946 when a three-day public forum on "Science and Civilization," marking the centennial of the birth of George Westinghouse, was attended by more than 600 of the nation's foremost scientists, educators and industrial leaders.

The decade was also marked by advances in facilities for higher education. Despite mobilization of students and faculty members for national service in the war years, the end of the decade found universities and colleges largely increased in enrolment, endowments and physical plant.

Three notable contributions to the cultural resources of the district were recorded. In 1938 the Pittsburgh Symphony orchestra was augmented under the direction of Fritz Reiner. In 1946, for the first time, a two-month season of open-air civic light opera was presented to a total attendance of 270,000. In 1939 the Buhl Planetarium and Institute of Popular Science was dedicated, a gift to the city of Pittsburgh in memory of Henry Buhl, Jr. Carnegie institute planned to resume, in 1947, its famed international exhibition of art, suspended after 1939.

* * *

NOWHERE was civic awakening more brightly reflected than in the field of city planning and public works. Midway in the decade the Pittsburgh Regional Planning association sponsored proposals for improvement of transportation facilities evolved by a study headed by Robert Moses. The city planning commission produced a land-use survey, published an analysis of the city by improvement districts and a basic volume, *Groundwork and Inventory for Master Plan* and launched upon a city-wide rezoning study. County and city planning commissions joined in organizing a program of postwar public works. The Allegheny Conference on Community Development, an outgrowth of citizen-sponsored, wartime planning for postwar years, carried on an extensive program of community studies. Land acquisition was begun preparatory to creation of a 36-ac. memorial park at the confluence of the Allegheny and Monongahela rivers, commemorating Fort Duquesne and Fort Pitt. Ground was broken in 1946 for a high-speed parkway extension of routes 22 and 30 from the east to connect with the inner downtown traffic loop, first water-front sections of which had been built earlier in the decade. Plans called for extension of this through-artery to the west by a new bridge across the Monongahela and a tunnel under precipitous Mt. Washington.

Progress was made in attack upon the long-standing problems of flood control, smoke control and abatement of stream pollution.

The advent of 1937 found the city still reeling from the devastating effects of the most disastrous flood in its history, that of St. Patrick's day of the preceding year. Subsequently the federal government approved a program for the building of 13 flood-control dams in the headwaters of the Allegheny and Monongahela rivers and their tributaries, draining from four states. Six of these were completed and construction of a seventh begun, at a cost of nearly \$80,000,000. They were collectively capable of reducing the water level at Pittsburgh, on the basis of

its worst flood experience, by 9 ft. This program had a vitalizing effect upon the city's business district and in its low-lying industrial areas.

Limited enforcement of a smoke-control ordinance, enacted before the war, was begun in 1946.

More than a score of municipalities, including Pittsburgh, signed contracts with the newly-formed Allegheny County Sanitary authority for the preparation of plans for sewage disposal plants. New state legislation promised some relief from industrial stream-pollution by requirement for backfilling after strip mining of coal. Indications were that this advance would be supplemented by a renewed program of sealing abandoned underground workings.

Chatham Village—pioneering example of the large-scale planned garden-homes community, privately financed as a long-term investment—was completed as the decade opened and exerted a nation-wide influence upon urban housing. Other private housing in Allegheny county during the decade was principally financed by Federal Housing administration insurance of loans on 17,702 homes representing a total investment of \$117,250,933. Programs of federally-subsidized permanent public housing in 29 projects provided 10,829 dwelling units in Allegheny county, of which 5,462 were in Pittsburgh. In addition, temporary housing under federal programs provided 1,979 units. At the end of the decade the housing shortage was acute, although the pace of construction was accelerated in the summer of 1946 under the stimulus of guaranteed loans by the United States Veterans' administration.

The A. W. Mellon Educational and Charitable trust announced in 1946 that it would devote a major portion of its remaining assets, approximately \$50,000,000, to the development and improvement of conditions and institutions of the Pittsburgh area. Previously the principal activity of the foundation had been in the building and endowment of the National Gallery of Art in Washington, D.C. Among other significant developments was the establishment of the Pittsburgh foundation, a community trust, to receive and administer gifts and bequeaths, designated or undesignated.

During the war years, population increased little more than the 671,659, as enumerated in 1940. This was slightly less than one-half the population of Allegheny county, including 3 other cities, 68 boroughs and 53 townships. The city area was approximately 54.3 sq.mi. (C. F. Ls.)

Pius XI

Pius XI (1857–1939) was born of middle-class parents, Francesco and Teresa Ratti, at Desio near Milan, Italy, on May 31, 1857, and christened Ambrose Damien Achille. His seminary training was received in Milan and in Rome, where he was ordained to the priesthood on Dec. 20, 1879.

After obtaining academic degrees in theology, philosophy and canon law, he returned to Milan and was assigned to parish work until his appointment in 1882 to the faculty of St. Charles seminary as professor of dogmatic theology and sacred eloquence. In 1888 Father Ratti was named to fill a vacancy among the doctors of the Ambrosian library in Milan, and in 1907 he became its prefect. The policies he introduced widened the influence of the great library, and the writings he published, chiefly

in the field of Milanese history and Latin paleography, enhanced its prestige. He found an outlet for his pastoral zeal as chaplain to a community of sisters, as a religious instructor of poor children and as a trusted aide of Andrea Cardinal Ferrari in the development of his social program. For recreation he maintained his youthful interest in mountain climbing, a sport in which his proficiency is evidenced in his own memoirs and in the tributes of expert Alpinists.

Appointed vice-prefect of the Vatican library in 1912, he was made its prefect at the outbreak of World War I. Monsignor Ratti's scholarly seclusion was abruptly terminated four years later, when he was assigned the difficult task of apostolic visitor in a resurgent Polish nation whose religious life was badly disorganized. His tactful and devoted efforts were so successful that he was made the first papal nuncio to the newly established Polish republic and consecrated as titular archbishop of Lepanto in the Warsaw cathedral on July 19, 1919.

In March 1921 he was named archbishop of Milan and was created cardinal in the consistory of the following June. While still engrossed in the problems that face a new bishop, Cardinal Ratti was summoned to Rome for the conclave which followed the death of Benedict XV and which on Feb. 6, 1922, elected him as the 260th successor of St. Peter.

During his 17-year reign, Pius XI met the problems of his time with apostolic vision and firmness. In Italy the Lateran accord of 1929 guaranteed the spiritual independence of the Holy See and vindicated the position which the "prisoner popes" had valiantly defended since the seizure of the papal states in 1870. It also included a concordat which secured the freedom of the church in promoting the spiritual welfare of the faithful. In his pastoral guidance of the universal church, Pius XI consistently urged the need of dynamic faith in everyday life. To the world at large he stood out as an inspiring religious leader and a courageous defender of the dignity and rights of men against economic oppression and totalitarian tyranny. His better-known encyclicals, keen in their analysis and uncompromising in their denunciation of fascism (*Non Abbiamo Bisogno*), nazism (*Mit Brennender Sorge*) and communism (*Divini Redemptoris*), or constructive in their outline of a Christian program for the reform of economic and industrial society (*Quadragesimo Anno*), rank among the great papal documents of all time. On Feb. 10, 1939, death brought to a close the vigorous pontificate of Pius XI—the first pope whose voice was literally heard around the world, speaking, as he himself said, "not only as Head of the Catholic Church but also as a man of our day . . . as a witness of the events which menace our contemporaries and the institutions which frame and develop their daily individual, family and social life."

Pius XII

Pope Pius XII (Eugenio Maria Giuseppe Giovanni Pacelli) (1876–), was born in Rome, March 2, 1876, of noble though not wealthy ancestry. His mother, Virginia Graziosi, came from a distinguished Roman family and his father, Filippo Pacelli, was a frequent legal con-

sultant to Leo XIII and Pius X. Under Gregory XVI and Pius IX both of his grandfathers, following the deeply religious traditions of the family, held offices associated with the Holy See.

The boy, Eugenio Pacelli, possessed exceptional qualities of character and intellect. In 1894 he graduated from the celebrated Ennio Quirino Visconti school with highest honours, and a commemorative plaque there records that "velut oriens sidus emicuit qui nunc fulget in orbe terrarum" (like the rising sun, first appeared here he whose splendour now shines throughout the world).

That same year Eugenio Pacelli manifested a vocation to the priesthood and in the autumn entered the College of the Capranica founded in 1457, the oldest of the Roman seminaries. He completed his studies in philosophy in the pontifical Gregorian university, and his courses in theology and in canon law were taken in the pontifical Roman seminary, from which he received degrees in both subjects *summa cum laude*. During the solemnity of Eastertide, April 2, 1899, he was ordained to the priesthood, and on the following day Father Eugenio Pacelli offered his first holy sacrifice of the mass in the Borghese chapel of the Basilica of St. Mary Major.

For two years following his ordination the young priest

Pius XII giving his blessing as a procession followed him to the Church of St. John Lateran, Rome, in May 1939. It was his first departure from the Vatican after he was crowned pope two months earlier

served as a curate and combined the works of the ministry with the apostolate of teaching. His zeal for the salvation of souls and his genius as a professor became known to the officials in the secretariate of state, Monsignor Giacomo Della Chiesa, the future Pope Benedict XV and Monsignor Pietro Gasparri, the subsequent secretary of state to Popes Benedict XV and Pius XI. Because of his diverse abilities and especially because he was an able jurist, Monsignor Pacelli was appointed a member of the Sacred Congregation for Extraordinary Ecclesiastical Affairs, and in 1912 he became secretary of that congregation, the first section of the secretariate of state.

Monsignor Pacelli was assistant both to Cardinal Merry del Val, secretary of state to Pope Pius X, and Cardinal Gasparri, secretary of state to Pope Benedict XV. In addition to the regular duties of his office, the fervent young monsignor was assigned to the gigantic task of codification of canon law.

On April 20, 1917, while World War I was raging, Monsignor Pacelli was appointed apostolic nuncio to Bavaria and was consecrated titular bishop of Sardis by the holy father himself, Pope Benedict XV. The consecration took place on May 13, 1917; among those present at the sacred rite was Monsignor Achille Ratti, then a simple prelate, who was later to become Pope Pius XI. The new nuncio's integrity, scholarly gifts and wise counsels won the respect of Kaiser Wilhelm II and his chancellor of the reich, Bethmann Hollweg, and the activity, apostolic zeal and vibrant oratory of the distinguished prelate were everywhere proclaimed.

In 1920, Archbishop Pacelli, continuing in his office as apostolic nuncio to Bavaria, was named nuncio to Germany, and in that same year he left for Berlin. After four years of increasing, tireless work, the solemn convention between the Holy See and Prussia was concluded, and the concordat with Bavaria was ratified Jan. 24, 1925.

Pope Pius XI elevated Archbishop Pacelli to the cardinalate in the consistory of Dec. 16, 1929, and assigned to him the title of the Church of Saints John and Paul. On Feb. 7, 1930, the holy father, in a letter written in his own hand, appointed Cardinal Pacelli to succeed Cardinal Gasparri as secretary of state, and from that day began a new era in the life and labours of this devoted, faithful interpreter of the will of the Holy Father.

Cardinal Pacelli was an extensive traveller. On several occasions he represented Pope Pius XI as papal legate—at Lourdes, France, April 1935; Lisieux, France, July 1937; Buenos Aires, Argentina, Oct. 1934 and Budapest, Hungary May 1938. In 1901, as Monsignor Pacelli, he had journeyed to London with Monsignor Merry del Val to convey the official condolences of Leo XIII on the occasion of Queen Victoria's death, and in 1908 he returned to London with the papal legate to the Eucharistic congress. He again went to England in 1910 as a member of the papal mission, representing the pope at the coronation of King George V and Queen Mary.

Cardinal Pacelli arrived in the United States on Oct. 8, 1936, for a visit of several weeks, during which time he toured the country and covered more than 8,000 mi. by air. He visited New York city, Boston, Mass., Hartford, Conn., Cleveland, O., South Bend, Ind., for a visit to the University of Notre Dame, Chicago, St. Paul, Minn., San Francisco, Los Angeles, St. Louis, Mo., Cincinnati, O., Washington, D.C., Baltimore, Md., and Philadelphia and other cities where he met and talked with many leading U.S. citizens in both civil and religious life. The people

of the U.S. were magnetized by the calm spiritual majesty and democratic ardour of Cardinal Pacelli. He visited and lunched with President Roosevelt at Hyde Park, N.Y., and one of his first acts on returning to his desk in the Vatican was to write the president: "My travels in the United States left impressions on me among the deepest of my whole life."

In the consistory of April 1935, Cardinal Pacelli was elected Cardinal Camerlengo of the Sacred College of Cardinals, a position which on the death of the pope places upon the incumbent the responsibility for the administration of the affairs of the church until a new pope is elected. After the death of Cardinal Merry del Val, Cardinal Pacelli became archpriest of Saint Peter's, and on the death of Pius XI on Feb. 10, 1939, he assumed the administrative government of the church and the state of Vatican City.

In the conclave that was convoked for the evening of March 1, 62 cardinals of 27 different nationalities met to elect the successor to Pope Pius XI. The announcement of the election of Cardinal Pacelli was made a little after six o'clock on March 2, his 63rd birthday. That evening as Pope Pius XII, the name he chose in tribute to the two pontiffs under whom he had spent most of his active life as a churchman, the holy father imparted his blessing to the city and the world, *Urbi et Orbi*. His coronation took place on March 12, 1939, in the Basilica of St. Peter, in the presence of a vast concourse of people with 36 nations officially represented.

As pope, Pius XII will ever be remembered as the fearless advocate of a just and lasting peace, the unequivocal opponent of all forms of state-idolatry and race prejudice and the staunch defender of natural human rights and basic human freedoms of man.

The Holy Father had early become an inspiring speaker, using no manuscript and memorizing most of his important addresses, fluently delivered in any one of seven languages. From the world radio broadcast of Aug. 24, 1939, in which he uttered the phrase "nothing is lost by peace, all can be lost by war," to his radio message of May 9, 1945, at the end of World War II in Europe, Pope Pius XII's writings, teachings and pleadings were for world peace with justice, to which the seven volumes of his collected addresses bore eloquent testimony. Again and again he pleaded that international agreement make war less inhuman by confining it to combatants and denounced the horrors of indiscriminate bombings of noncombatants—the women and children, the sick and aged, the hospitals, charitable institutions and houses of prayer. During the entire war he remained in Rome, and when the city was bombed by the U.S. air force on July 12, 1943, unguarded and unafraid, he hurried to the scene of disaster and gave his blessing and personal aid to the afflicted. He wept and prayed with his people as they stood before the bombed Basilica of San Lorenzo.

During the war, the Holy Father instituted the office of information concerning war prisoners and refugees, to which was later added the Pontifical Commission for Assistance which furnished food, clothing, medicines for the poor, the suffering, the sick, the wounded and imprisoned. In humility, simplicity, understanding and sympathy throughout the war, he prayed and pleaded for "the sorrowing hosts of mothers, widows and orphans, numberless exiles and hundreds of thousands of persons, who without any fault on their part, sometimes only because of their nationality or race, had been consigned to death."

In the relations of the pope with various states may be recorded the concordat with Portugal, May 7, 1940; the agreement with the republic of Haiti, Jan. 31, 1941; with Spain, June 7, 1941; with Colombia, April 22, 1942, and the intervention for the peoples' solution of the conflict between Peru and Ecuador 1941; historic telegrams to the sovereigns of the Netherlands, of Belgium and of Luxembourg of May 10, 1940, at the beginning of the unjust invasion of those countries by the German troops; the letter to the Swiss federal council on the 650th anniversary of the confederation.

A few of the Holy Father's pontifical documents were the encyclical *Summi pontificatus* of Oct. 20, 1939, which traced the general program of the papal activity; the encyclical letter *Sertum laetitiae* to the hierarchy of North America on Nov. 1, 1939, for the 150th anniversary of the establishment of the American hierarchy; the encyclical *Saeculo exeunte* of June 13, 1940, to the Portuguese bishops on the occasion of the eighth centenary of the independence of the nation and the third centenary of the freedom; the encyclical *Mystici Corporis Christi* of June 29, 1943; the encyclical *Divino afflante spiritu* of Sept. 30, 1943, on the most opportune method of promoting Bible studies; the encyclical *Orientalis ecclesiae* of April 9, 1944, for the 15th centenary of the death of St. Cyril of Alexandria; the encyclical *Orientales omnes* on the occasion of the 350th anniversary of the union of the Ruthenian Church to the Apostolic See, dated Dec. 23, 1945; the encyclical *Communium interpretes* of April 15, 1945, with its direction for public prayers for peace among people; the encyclical *Quemadmodum* of Jan. 6, 1946, to invoke help for children struck by the consequences of the war.

During the pontificate of Pius XII, Gemma Galgani and Maria di S. Eufrasia Pelletier were canonized on May 2, 1940, Margaret of Hungary, Nov. 19, 1943, and on July 7, 1946, was canonized the first American saint, Mother Frances Xavier Cabrini.

On Dec. 23, 1945, 32 archbishops and bishops from 5 continents were named cardinals of the church. In its number and universality, this event was unique in the history of the church. On Feb. 18, 1946, in a secret consistory in the Eternal City, these 32 prelates from 18 nations were formally elevated to the sacred college of cardinals.

The name-day of St. Eugene, the patron saint of his holiness, is June 2. The family name, Pacelli, is significantly a derivative of the Italian *pace*, which means "peace" and on the papal coat of arms is a dove with an olive branch. In the celebrated prophetic list of Saint Malachy, the holy father was described as *Pastor Angelicus*, angelic shepherd, and daily he worked, prayed and literally died for peace among men. He knew that revenge is a bitter, gnawing thing; that hate begets hate and brutality spawns brutality. "All nations, great and small, have a right to live" declared his holiness as he begged that the victors temper their victory-in-arms with charity and justice in peace. (See also ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.) (F. J. SN.)

Pizzardo, Giuseppe

Cardinal Pizzardo (1877–), Italian prelate, was born June 13, 1877, in Savona, Italy. Entering the priesthood in 1903, he rose to the post of undersecretary of state in 1921 and secretary for extraordinary ecclesiastical af-

fairs to Pope Pius XI in 1929. He was named titular archbishop of Nicea in 1930. He was appointed papal legate to the coronation of King George VI (1937) and later that year (Dec. 13, 1937) was created and proclaimed cardinal priest. In the following year (1938), he was made president of the central office of Catholic action. Cardinal Pizzardo became prefect of the congregation of seminaries and universities in 1939.

Plague, Bubonic and Pneumonic

Although much of the natural history of plague had been known for nearly half a century, and considerable progress had been achieved in the development and application of measures to combat its spread within communities and to remote areas, it still remained a menace to the people of the world at the end of the eventful decade 1937-46.

Cognizance of the persistence of this threat was reflected in international agreements on the subject. Its classification as one of five quarantinable diseases (cholera, exanthematous typhus, plague, smallpox, yellow fever) was continued in 1944 by a special committee of international experts in co-operation with the International Office of Public Health of Paris, and with the United Nations Relief and Rehabilitation administration. Their recommendations became amendments to the Agreements of the International Sanitary convention of 1926, providing for maritime quarantine, and to the International Sanitary Convention for Aerial Navigation of 1933. Seventeen countries were signatories of the two amended agreements which came into force on Jan. 15, 1945. These countries agreed to notify one another of the occurrence of plague in man or in rodents on their ships or planes or in their ports, and to execute measures to prevent its spread to other countries.

Prevalence.—Plague is primarily a disease of rodents. Among these, rats (*Rattus*) of a few species continued to be of special importance, since they frequent the haunts, habitations and public conveyances of people, and are also transported in commercial shipments. The disease prevails in man and animals of Africa, the Americas, Asia, Europe and some Pacific islands; its types continued to be deadly. However, during the decade 1937-46, there was a marked decrease in incidence in man, and probably rats, in the principal ports of the world, insofar as could be determined from reports available before and during World War II. The cause of this reduction was not clearly discernible. Advances had been made in the prevention and treatment of cases, and in the destruction of rats and their infesting fleas. The execution of these antiplague measures in endemic areas, on ships, and in ports may have been the contributing factor; or, the change may have been brought about through undetermined natural phenomena.

There were no epidemics of unusual proportions during this period, but rat-borne outbreaks appeared during World War II in the Punjab, along the Burma road in Yunnan, in Thailand (Siam) and in some northern provinces of China. The Mediterranean area was revisited. Morocco reported 1,098 cases in 1940, 2,337 in 1941, and 583 in 1942, and the Casablanca district continued to be affected. Suez, Port Said, Ajaccio and Taranto each had sharp but limited outbreaks. There was a reappearance at Dakar, with 562 cases reported between April and the end of the year of 1944.

Cases occurring in the interior of India, China and South American countries at distances relatively remote from ports, as well as those in Madagascar and Pacific islands, were attributed to infection among rats. Those

occurring in Africa, the U.S.S.R., Manchuria and North America apparently were contracted from field rodents.

The disease continued to be widely disseminated among rodents of the Veldt in the Orange Free State, Cape Colony, Bechuanaland, Basutoland, Northern Rhodesia, and other portions of Africa. Many cases arose from these animals, some of which invaded human habitations. On the contrary, very few cases developed in consequence of widely-spread infection among analogous animals in Alberta, Canada, and in the western United States.

The natural history of plague in these wild field rodents was the subject of intensive studies in Africa, the U.S.S.R. and the U.S. Spontaneous or naturally-acquired infection was found among many genera of Scuridae (squirrels and marmots), Muridae (mice, rats, gerbilles), Jaculidae (jerboas), Leporidae (hares) and Cavidae (cavies). During the decade 1937-46, successive surveys of the field animals were made in western states of the U.S.A. Specimens of 26 genera of Rodentia and of nineteen genera of other orders, and of 53 genera of fleas were collected and examined. Plague was found in the tissues or in the infesting fleas of 12 species of *Citellus* (ground squirrels), of twelve other genera of rodents, and of *Mustela* (weasels), *Taxidea* (badgers) and *Lepus* (hares). Among a portion of the genera of fleas adequately investigated under laboratory control, there were 36 species which became infected and 19 which proved to be capable vectors of the infection to guinea pigs or white mice. Infected ticks and lice were also collected from these field animals.

These systematic field surveys, accompanied by laboratory researches, contributed to the method of detection of plague in advance of the development of the disease in man. They demonstrated also the practicality of detecting foci of infection in rodents through the collection and examination of their ectoparasites. These field collections and investigations in field and laboratory also furnished presumptive evidence that fleas remaining in burrows or nests of these animals serve as a reservoir to carry over the disease from season to season. Similar surveys and studies in Alberta, Canada, South Africa, and the U.S.S.R. led to comparable results and conclusions.

Prevention.—The prevention of outbreaks of plague in man and the reduction of the mortality caused by it in endemic areas, through the immunization of people by prophylactic inoculations, had been subjects of research for many years.

The prophylactics or "vaccines" had been prepared by different formulae of manufacture, but they had adhered to W. M. W. Haffkine's principles rather consistently. These involved the use of dead plague bacteria and the toxic products resultant to their growth. The specific bacterium, *Pasteurella pestis*, is grown in a suitable media and then killed by heating or by the addition of a chemical. Reports on the efficacy of these vaccines in reducing either the incidence or mortality of the disease were inconclusive or conflicting. However, efforts to improve them were the subject of renewed and consistent investigation. Strains of the bacterium which have the maximum ability to produce neutralizing substances in the body (antigenic qualities) were sought and selected; methods of manufacture and of testing, and of determining their value in protecting white mice against artificially-induced plague were technically improved and standardized. The advocates of these preparations consistently maintained their superiority, and they were used as a protective measure for troops of the Allied armies which

operated in areas in which plague had been endemic.

Some of these vaccines made of the dead bacteria unquestionably reduced the mortality among laboratory animals in which plague was induced. However, their efficacy in immunizing the individual to a degree which wards off the disease, or even to that which diminishes its severity, continued to be challenged by able investigators.

In 1934 an investigator in Java and one in Madagascar had made vaccines from live plague bacteria which failed to produce the disease when introduced into guinea pigs, a very susceptible animal. These preparations of virulent organisms were used extensively during the decade and gave promise of being a notable contribution to anti-plague measures if the recorded observations of their work were further validated. On the other hand, the introduction of live pathogenic bacteria into human beings was attended with the risk that the avirulent forms might assume a virulence under the conditions of the human host environment.

The Madagascar vaccine was made from a strain of bacteria obtained from a human case of plague (E.V. strain) and was introduced as a prophylactic in 1935. During the succeeding three years, over 2,000,000 vaccinations were made, and the originators of this vaccine claimed that an 80% reduction of mortality was accomplished. The incidence of the disease recorded during the five years 1933 to 1938 was 3,493, 3,605, 3,035, 1,376, and 596 respectively.

The vaccine used in Java was prepared from a strain isolated from a dead rat (Tjiwidej strain) and was put into practical application during 1935 also. By the end of the year 1939, there were 9,286,237 vaccinations performed. During the four-year period, a great reduction in both the incidence and mortality was reported. The originator of this vaccine believed also that the mortality of the disease had been reduced to 20% of the cases and that it might be reduced to 10%.

The immunization of people against plague was accompanied by anti-rat measures in Java. The remodelling or construction of dwellings to make them resistant to the invasion and harbourage of rats was an integral part of the antiplague campaign, and by the end of the year 1938, these changes had been accomplished in 1,525,364 houses. During that year, 56,225 had been remodelled, and 54,548 were built in accordance with approved designs.

In fact, renewed interest was focused on improvement of methods for the control of rats and on more extensive practice of established methods. The movement of these rodents from port to port and consequent transportation of their diseases was greatly restricted by systematic inspections, fumigations and revision of ship construction to render it relatively rat-proof. New ships included this construction, and older ships were remodelled. The rat-riddance attributed to these measures was indicated in reports on ships arriving at Atlantic ports in the U.S. Between July 1, 1936, and Jan. 31, 1937, there were only 8.4% of 4,418 entering ships which were infested, in comparison with 50% of the entries at New York between 1925 and 1927.

Protection of troops during World War II from rodent-borne diseases required measures for the most rapid destruction of these animals that could be effected. Fumigation, with preparations of hydrocyanic acid gas, was applied to ships, buildings and to burrows. Two chemicals were found to be very toxic to rats when used with baits. Sodium fluoracetate, commonly known as 1080 during the war, is very soluble in water and appeared to be an ex-

cellent rodenticide. It can be offered to rats in drinking water or in solid food baits. Alpha-naphthyl thiourea (ANTU) is also very poisonous to Norway rats when used in the form of a powder on suitable baits. The relative toxicity of these two chemicals to rats was determined by administering the dose to the animal through a stomach tube. The lethal amount for rats per 1,000 grams of weight, and, for comparison, the deadly dose of strychnine sulphate was found to be as follows: 0.22 mgm. of 1080 per kilogram of animal; 4.8 mgm. of strychnine sulphate; and 6.3 mgm. of ANTU.

The discovery in 1939 that dichloro-diphenyl-trichlorethane (DDT) was an effective insecticide was quickly applied in a practical manner. The use of this chemical in a mixture of an inert powder for dusting, or dissolved in oil, such as kerosene, for spraying against lice, flies and mosquitoes was widely adopted. Experimentally, it appeared also to be a valuable pulicide. During an outbreak of 562 cases of plague at Dakar, S.W. Africa, in 1944, both people and their habitations were dusted and sprayed with it, and observers concluded that these measures hastened the subsidence of the outbreak. These tests were made in an emergency and during the period when the epidemic seemed to be declining. However, other tests were in progress to determine its value for suppressing flea infestations in structures and burrows under controlled conditions. The results obtained by 1946 suggested that this insecticide might be a valuable addition to antiplague measures.

Treatment.—In 1935, it was found that sulfonamide compounds protected white mice against experimentally-induced infections with a strain of virulent bacteria (streptococci). This observation led to widely-spread studies of their chemotherapeutic properties against other infections. It appeared that the antibacterial qualities are not directly bactericidal, but check the growth of bacteria through interference with some processes of their metabolism and multiplication and afford better opportunity to the defense mechanisms of the host to combat the infection. The different chemical derivatives also display quantitative selection in their action against specific bacteria. Sulfanilamide, sulfathiazole, sulfapyridine, sulfadiazine, and sulfapyrazine were used in the therapy of plague in China, India, South Africa and South America. Sulfadiazine and sulfathiazole were reported as valuable in reducing the mortality of the bubonic form of the disease if the drugs are administered in adequate dosage early in its course and are continued until convalescence is established. Sulfadiazine was preferred by several investigators. A report of the use of sulfathiazole and sulfadiazine in treating 349 cases was as follows: The mortality among 90 admissions given sulfathiazole was 33.1%, among 90 alternate admissions given sulfadiazine, the mortality was 21.9%, while 58.1% of 169 cases died after the customary treatment with iodine. The exclusion of those cases which were moribund at admission suggests that a greater reduction occurred in the mortality.

There was ample evidence of notable advances during the decade 1937-46 toward understanding the natural history of plague and devising means for its control. However, experience with the natural fluctuations in the incidence and severity of this and other infectious diseases during previous epidemics and pandemics cautioned against undue optimism over the apparently beneficial effects of individual control measures. Thus, complacency over later attainments was not justified; rather there was need for consistent alertness and effort to learn more about plague.

Plastics Industry

The dynamic growth of the plastics industry and the seemingly endless expansiveness of its spectacular, as well as its prosaic, applications captured public imagination during the decade 1937-46. Anticipation of its promising future focused attention on its latest developments with little appreciation of the broad foundation upon which the remarkable achievements of the decade rested.

The plastic industry recorded a phenomenal growth

statistically, although it must be recognized that it was still relatively small when compared with the major metals-producing groups. However, from relatively unimportant amounts during the period after World War I, consumption of plastics increased fairly rapidly during the decade of the 20s. In the period from 1929 to 1940, there was a 450% growth, and after 1940, production, in a large part for war purposes, almost quadrupled again.

The expansion during World War II was best indicated by a late 1945 report by the United States War Production board, which revealed a 325% increase in the 1944 dollar volume of plastics and synthetic resins over that of 1939. In 1944, materials production was in the neighbourhood of over 850,000,000 lb., and sales were at approximately \$350,000,000 as compared with a \$72,000,000 evaluation for 1939. Over the same period, finished parts produced by moulding, lamination and fabrication were valued at approximately \$310,000,000.

Figures released in the fall of 1946 by the United States tariff commission and the bureau of census showed that production of all plastic materials (during 1945) was the largest on record, amounting to 900,000,000 lb., or 50,000,000 lb. greater than 1944.

The accompanying table shows the later rate of production of some of the more important plastics and the estimated rates after expansion as compared with the base year of 1939:

Material	Rate of Production (1939 Equals 100)		
	1945	Aug., 1946	After Expansion
Phenolics (moulding)	185%	267%	334%
Cellulosics "	484	570	745
Polystyrene "	3,260	11,130	31,200
Vinyl (all uses)	1,250	1,438	3,000

Source: Plastics Materials Manufacturers' Assn.

The most outstanding advances in the use of plastics occurred in the United States and in Germany, where chemical production dominated. Great Britain, third in rank at the end of World War II, was undoubtedly accelerating its plastics output, and its research laboratories kept pace with the leaders in development of new materials and techniques. Canada, Australia and New Zealand had well-developed plastic industries, although comparatively smaller in scope. No statistics were available as to the strength of the industry in the U.S.S.R., although the large volume of technical work of high quality indicated an advanced industry. Latin American countries which, up to the close of World War II, were large users of both imported plastic end-products as well as of basic raw plastic materials, were branching into domestic manufacture of both raw and finished plastic products. Every industrial country had made strides in the use of various specific types of plastics, and the year 1946 found virtually no country, no industry, and practically no phase of life untouched by plastics—and vice versa.

Prewar Period.—The last three years of the '30s marked the advancement into full scale production of plastics introduced just a few years earlier, as well as the appearance of new materials which were to become the industry's leaders. Commercial production of polystyrene resins was announced in 1937 as the availability of the required raw materials at low enough prices justified their use. An ethyl cellulose moulding-compound made its bow that year and the first lignin plastic sheeting was manufactured.

Other additions to the cellulosic family (cellulose acetate butyrate and methyl cellulose) came in 1938. Melamine resins were introduced commercially in 1939 in the

United States and Great Britain, and were quickly utilized for heat- and arc-resistant electrical applications and for other products for which urea resins had previously been the only suitable plastic.

Vinyl butyral replaced cellulose acetate as a safety glass interlayer in 1938, and a plasticized vinyl resin calendered sheet appeared. In this same year nylon, the first all-synthetic fibre, made its appearance although actual commercial uses for hosiery, brush bristles, surgical sutures, etc., did not go into production until 1939. Vinyon, a vinyl-derived filament yarn, followed close on its heels.

In Germany, there was reported extensive use of styrene in the manufacture of "Buna" synthetic rubber as well as for chemical uses and other applications which greatly extended the use of the styrene group in that country.

Urea resins moved into moulding compounds, impregnating syrups, adhesives and lacquer constituents and in England it was used as the bonding agent for plywood boats. In France, urea resins were utilized for table tops as large as 960 sq.in. and also for large switchboards and decorative panels.

By 1939, phenol-formaldehyde products represented over 70% of the total output of moulded plastic products for camera cases, housings, corrosive-resistant apparatus, etc. Phenolics were widely used in electrical, communication, automotive and aviation industries. Laminated plastics extended the scope of their service in mechanical products as well as nonmetallic gears. Up to 1939, cast phenolic resins went principally into decorative applications such as buttons, jewellery, radio cabinets, games, etc.

Manufacture of vinylidene chloride resin was initiated late in 1939, but it was not until later that extruded fibres woven into upholstery, fishing lines, etc. showed its qualities.

Because of their remarkable optical properties and non-fragile character, methyl methacrylate resins infiltrated into the transparent media where glass products long had control—airplane windshields, lenses, highway reflectors, edgelighted signs and illuminated displays. Denture materials based on acrylate resin became widespread in the United States and England. There was great activity in the automatic moulding field, and compression moulding was speeded up to meet competition from injection moulding advocates. Eight fully automatic compression-moulding presses were introduced, and one company attempted to mechanize the transfer method. A thermoplastic injection machine which could be adapted to thermosetting materials had trial runs. Multiple unit injection-presses were used principally for steering wheels, radiator grills, automotive instrument panels and window frames.

Conversion to Wartime Uses.—Throughout the world, plastic materials were being tailored to the military form after the outbreak of World War II. As war needs expanded, the industry created entirely new materials to fit the specifications written by the armed services. Activities in Germany and German-controlled territories as reconstructed from the post-war reports of technical investigation commissions (see latter part of this article) indicated that the German plastics industry was large and self-contained, with the greatest concentration of effort on chemical development rather than on mechanical production. The availability of abundant "slave" labour no doubt obviated the need for labour-saving contrivances.

In the United States and Great Britain there was an enormous increase in plastics in 1940, to replace other

strategic materials such as metal and rubber, as military uses for plastics were then still in the embryonic stages, leaving them comparatively free for civilian products.

No really new materials appeared on the market in 1940, but an outstanding rise in volume and stature was credited especially to the vinyl ester resins and to cellulose acetate butyrate. Nylon installed itself in the industrial field as bristles for brushes used in textile printing. Vinylidene chloride was rapidly gaining influence in the high-strength fibre field. Cellulose acetate plastics of higher acetyl content (58% acetic acid) offered greater resistance to hot water and to warping at high humidities.

Production still centred around civilian items ranging from shower curtains of plasticized vinyl resin, to phenolic and urea radio cabinets (more than one-half of the sets made in 1940 used plastic housings) and extruded plastic woven into furniture upholstery replacing reed and rattan. New moulded plastic parts cropped up in innumerable industries ranging from a marine bilge pump to urea louvres for fluorescent lighting fixtures, and Christmas tree balls of cellulose acetate.

The styrenes and acrylics were close competitors in such curiously assorted production outlets as ultra-decorative transparent furniture, automotive horn buttons and aircraft enclosures. Injection-moulded brushes came out in acrylics while styrenes did an outstanding job in radio insulation, coaxial cables and dashboard accessories. Ethyl cellulose sheeting was found to be suitable for the manufacture of deep-drawn rigid transparent containers and sales displays.

The aircraft industry used plastic plywood for moulding aeroplane wings and fuselages, and small resin-bonded plywood boats (the predecessors of the famed P.T. boats) proved to be simpler and more economical to fabricate as well as vastly superior in weather resistance.

The commercial introduction in 1940 of butadiene copolymer rubbers by all major United States rubber companies culminated a decade of experimentation with various synthetic rubbers. This further pointed up the growing shortages of raw materials, some of which could be replaced by the then more available plastics. Flexible textile coatings of plasticized cellulose nitrate, vinyl, etc., supplanted rubber as waterproofing. Vinyls were found to make excellent insulating wire coverings and sturdy gaskets.

There were several outstanding military applications in gas mask parts, aircraft and helmet liners, and three British fighting services reported over 1,000 uses for synthetic resins. The British also reported the use of clear acetate sheet, first to hold glass together in windows and then to replace it after it had been blown out.

The first shortages of U.S. plastics became apparent early in 1941, when thermosetting plastics became scarce. First formaldehyde and then phenol had to be placed on a strictly mandatory basis. (Germany and Great Britain had instituted government control over the sale and use of plastics in the previous year.) In view of this situation, a great deal of effort was put forth to develop and utilize nonstrategic and extender materials. Lignin, for example, because of low cost and availability, was given special consideration. Experimental work yielded a lignin moulding composition that compared favourably with some phenolic formulations. Thermosetting materials such as furfural, soybean and bagasse formulations and others requiring small percentages of the critical formaldehyde and phenols were carefully tested.

Many improvements were reported in reinforcing agents for use with phenolic resins, most of which were signifi-

cantly directed toward boosting the toughness and impact resistance of the plastics to make them more suitable for rugged work. These developments related to the use of crepe paper, wood pulp, glass fabrics and filaments, sisal, cottonseed hulls, metal powder and mica in plastic compositions.

Resin-treated and compressed wood was moulded and fabricated into metal-forming dies and aeroplane propellers in 1941. Cast phenolics took on industrial jobs, such as forming tools in aircraft factories and parts for oil-well drilling operations.

Laminates were among the first plastics to feel the impact of the change-over to war production, since the parts produced from them were generally stronger than those from moulding materials. Many standard shapes and forms fitted directly into U.S. defense demands. Aircraft manufacturers accepted moulded, laminated and fabricated plastics for radio antenna masts, aileron-control quadrants, cabin paneling, flooring, ventilators and fluorescent instrument panels.

Urea plastics appeared in meteorological and medical applications, and a threefold increase in the number of moulded urea sockets in 1941 coincided with the expansion of fluorescent lighting.

Although thermoplastics were helping to alleviate the metal shortage by replacing zinc die-cast parts, bronze, aluminum and other metal fabrications, the most extensive war use of thermoplastics was in transparent form for acrylic and acetate aircraft enclosures, light filters for blackout lights, moulded cellulosic gas mask parts, vinyl cable insulation, ethyl cellulose lacquers and coatings for shells.

Styrene was requisitioned for synthetic rubber, and the United States government authorized the building and operation of government plants to produce styrene rubber-like copolymers. New plastic materials based on styrene—Styramic and Styraloy, of especial interest in the electrical field—were the forerunners of many modified polystyrene compounds.

Other thermoplastic materials showed similar trends toward war and essential civilian needs in 1941, especially after they were classified according to end use for purposes of government control. The U.S. automotive industry continued to use large quantities, and there were over 110 plastic applications in the 1941 model. Other volume markets, the refrigeration field and vacuum cleaners, also showed a multiplicity of plastic parts. Other consumer products were table trim, light shields, weather-stripping and motion picture screens. Both ethyl cellulose and the vinyls appeared as rubber replacements for gun covers, electrical tape, raincoats, coated fabrics and footwear. Optical qualities of methyl methacrylate were stressed in lenses of all types.

Vinylidene chloride advanced with the aid of modified extrusion equipment and methods. Fibres, cordage and cane-like sections evolved into upholstery fabrics, insect screening and rope, moulded fittings, tubing and pipe to replace aluminum, copper and rubber for instrument control lines, water, oil and air lines, etc.

Some revolutionary moulding techniques were brought to light in 1941. Machines for continuous injection of thermosetting material (jet moulding) had a thorough production test. A continuous-extrusion machine for thermosetting plastics was reported, and a combination extrusion-forming machine for making hollow objects in one piece, was in full-scale production. Large-capacity injection machines produced heavier units and in automatic compression-moulding, a 25% step-up in press speed,

Plastic tableware made of heavy duty melamine-formaldehyde and scientifically designed to meet restaurant requirements was being tested for commercial as well as home uses during 1946

coupled with substantial improvements in machine design, increased output per mould cavity. Fabrication of aircraft structures by the rubber-bag moulding process was in successful operation.

In Great Britain there was a tremendous increase in the use of plastics. Some of the items reported included polyethylene cable insulation, melamine adhesives for plywood structures, "scratchproof" unbreakable polystyrene spectacle lenses, moulded urea toilet floats and cellulose acetate eye shields and flexible windows.

Scattered information on the use of plastics in Germany, in 1941, indicated a huge production of synthetic rubber, and captured German aeroplanes showed considerable use of plastic parts both clear transparent—methyl methacrylate and polystyrene—as well as moulded and laminated metal replacements.

Rapid Growth of Military Demand.—The transition from civilian to wartime status was most evident in the first six months of 1942 as the plastics industry retooled to meet military demands. The U.S. industry co-operated fully in effecting conversion of materials and facilities, and the list of plastic applications for the military machine multiplied.

Ordnance components included moulded handles for pistols, bayonets and machine guns, fuse parts, ammunition rollers and booster tubes. The quartermaster's supply room contained helmet liners, whistles, bugles, skis and raincoats. The battle fleets employed plastics in navigation instruments, wire and cable insulation, binoculars and sturdy tableware. Small landing-craft and swift patrol-boats were made of resin-bonded plywood. Goggles, wire-reinforced flexible window enclosures, parachute flare bases and stirrup pumps were among other miscellaneous war products.

The aircraft industry standardized plastics for innumerable accessories and approved antenna masts, dies for forming metal sheets, fairleads, pilot seats, radio loop housings and propellers. Plastic plywood was employed in the construction of trainers and gliders as well as for miscellaneous structural parts. Compreg wood was used where high-strength products were needed.

Research activities in surface coatings were directed toward camouflage coverings for cloth, buildings and concrete or asphalt roads. Resinous coatings as protection against weather, climate, corrosion, etc. were widely used on fabrics, metals and wood.

Because of the difficulty in obtaining equipment for

new plants, there was little activity in marketing new materials. One dramatic entry of 1942 was an allyl type resin, a thermosetting transparent resin which polymerized rapidly and was adapted to low-pressure moulding and contact-pressure laminating.

The spur of war demands extracted a number of new plastics from the chemical laboratories in 1943. Synthetic replacements for natural mica—a critical component of radio and electrical apparatus—were being developed. One of these was Polectron, which was said to have an unusual combination of low dielectric loss, high-temperature stability and superior water resistance. An inorganic mineral element, silicon, was combined with organic radicals composed of carbon and hydrogen to form a new group of plastics called silicones—suggested for use in electrical insulation where their high-heat resistance—500° F.—offered unique qualities. Adhesives called Cycleweld and Reanite, which bonded together wood, metal, plastics, ceramics, fibres and rubber, were announced. These thermosetting materials, applied to the surfaces of parts to be bonded and then cured under heat and pressure, formed light cheap structures, stronger than those produced by conventional gluing.

Reinforced plastics made possible large-volume production of low-cost, lightweight, high-strength structures and offered many advantages beyond the replacement of critical aluminum and magnesium. Several new unsaturated polyester and allyl resins, Laminac, Allymer and MR-resins were brought out from behind censorship barricades. These resins had properties which permitted them to harden at low or no pressure without costly dies and were combined with reinforcing materials such as specially developed papers, glass fibre, cotton and other fabrics to make large and economical structures formerly considered impractical for plastics.

Materials appeared in fresh guises—nylon was moulded into products of low moisture-vapour transmission; vinylidene chloride appeared as a nonflammable packaging film, and vinyl chloride-acetate rigid sheets were used in air forces navigation and calculating instruments, templates and radio transcription records for overseas service. An improved heat-resistant clear methacrylate moulding compound also appeared. Low pressure moulding, post-forming of laminates and moulding with high frequency passed rapidly through their experimental stages to become first-rate methods of plastic production.

In addition to the many standardized aircraft parts and other widely accepted uses of plastics for ammunition boxes, doors, wing and tail units, gun turrets, engine parts, etc., production in 1943 added jettison tanks, bomb racks, radar housings, barrage balloon valves and speed indicators as important aircraft applications. Resin-bonded plywood was moulded at low pressures into monocoque structures utilizing sandwich constructions comprising high-strength sheets bonded to low-density cores.

Other military applications which came to light were bomb-recorder frames, snake bite kits, insignia, hand grenades, foot tubs, training bayonets, medical supplies, walkie-talkie equipment, tank periscopes, ship propeller bearings and binocular carrying-cases.

The nonmilitary applications were highly restricted, although vinylidene chloride for piping, screening and packaging set a new course for this plastic. Vinyl resins appeared in shoe soles and flexible electric insulation. Ion exchange resins were employed in many industrial pro-

cesses for purification of water-conditioning apparatus.

Last Two Years of War.—The year 1944 was one of steady growth, with wartime arrivals fulfilling their early promise and new materials and techniques adding to the stature of plastics. Increased production of moulding powder was largely used in war matériel.

Virtually the entire production of polyethylene was channelled into wire and cable insulation where its low electrical losses, moisture impermeability and general physical and chemical characteristics established almost top rating. A remarkable high heat-resistant thermoplastic, Cerex, appeared in coil forms, condenser cases, battery jars and sterilizable surgical instruments. Styramic H. T., a styrene derivative of improved resistance with a heat distortion point of 236° F. and electrical characteristics better even than those of polystyrene, was completely absorbed for ultra-high-frequency insulation in secret war equipment. A new form of styrene product appeared—an extremely fine fibre ranging in size up to 0.002 in. in diameter. This polyfibre made possible low-pressure bag-moulding of large thermoplastic parts.

Vinyl resin dispersion in a solvent plasticizer, or mixture of solvent plasticizers, was used in paste form as a coating for cloths, forming a homogeneous, tough, elastic film.

Resorcinol-formaldehyde resins, curing rapidly at temperatures from 60° to 150° F. under nearly neutral conditions, were found advantageous for assembly-bonding of wood and other materials which were deteriorated by strong acids used in most other cold-setting urea and phenolic glues.

Experimental applications were developed of 100% furane resins which could be moulded, laminated, cast, sprayed as air-drying coatings and used as adhesives and impregnating agents.

During 1944, the low-pressure and so-called "contact" resins proved satisfactory for low-cost, large, compound-curved structures of great strength. One new low-pressure development was a continuous production unit for making laminates with new contact resins, from fabrics and papers of all kinds in single or multiple laminate form. These laminates proved weather and temperature resistant, and dimensionally stable.

"Sandwich materials" and "expanded" or "foamed" plastics were also among the noteworthy developments of 1944. The advantages of sandwich construction involving stiff dense faces separated by thick light cores, long recognized, was augmented by sandwiches of low-density porous structures—foamed-plastic cores sealed within light metal alloys, resin-bonded plywood, laminated paper, cloth or Fiberglas surface layers. Successfully used for aircraft fuselages and buoys, they were suggested for insulation for refrigerators and prefabricated houses. Another highlight of 1944 was the adaption of the injection and extrusion moulding process to thermosetting plastic as well as to natural and synthetic rubber.

Only one new plastic appeared in 1945—Forticel, cellulose propionate. The commercial production of this plastic was made possible by the development of a new process for making propionic acid from cheap hydrocarbons obtained from natural gases and petroleum. Developments in other cellulose plastics included a flame-resistant composition, thermoplastic laminates and carboxy-methyl cellulose.

Lifting of censorship revealed improved transparent plastics for optical purposes. A plastic lens was made from polystyrene and cyclohexyl methacrylate. A new allyl ester resin (Kriston) was introduced which provided a thermosetting plastic of excellent clarity and a refractive

Below: Lucite coil forms and insulators for radios, used in military high-frequency equipment

index of 1.5483 at 28° C., higher than that of most optical glass.

Polyethylene's outstanding qualities as a high-frequency dielectric as well as its physical and chemical properties were seen in new applications including a polyethylene film for packaging purposes. The silicone family continued pre-eminent as an insulating material, both in the form of silicone rubber, baked resin coatings, impregnants for asbestos packings, and also as a treatment to make textiles, wallpaper, mirrors, etc., water repellent.

Melamine resins were applied to new use in decorative surface sheets for low-pressure laminates. Panel boards of glass fabric bonded with melamine resin provided navy ships with a fire and arc-resistant laminate of high impact strength. Phenolic-casting resins proved satisfactory in many applications, including plating shields, foundry patterns, forming dies and holding fixtures. Naturally-occurring phenolic compounds present in lignites were tested as a source of insulating materials. Lignocelluloses occurring in agricultural wastes were also used in the preparation of moulding compounds.

Wood pulp as a reinforcing filler in the formulation of tough plastics was given consideration, and wood itself, with its cellular structure relatively undisturbed, became an important addition to the reinforcing elements used in plastics. Solid wood, impregnated and moulded to shape, retained its natural beauty with resistance to water, acids, alkalies and heat, added. Wood, moulded, laminated or resin-bonded or resin-coated continued to be of interest to aircraft manufacturers.

Other types of reinforcing materials such as paper, cotton and glass fabrics continued to find new applications as did the synthetic core materials (foamed plastics) for sandwich type structures. Reconversion to civilian products focused attention on the latter for possible use in lightweight furniture, refrigerators, stoves and household insulation.

Improvements in processing and machinery fostered the expansion of plastics into many fields of use which prewar high cost had limited. Low-pressure and contact-pressure moulding and laminating continued to predominate as the outstanding opportunity for plastics growth. Electronic preheating and "hy-speed" plunger moulding helped keep conventional moulding fields from lagging too far behind. A machine which made possible the application of a combination of injection and compression-moulding techniques to thermoplastic moulding was introduced. This combination of two types of moulding retained all the advantages of injection without losing the high pressure on the plastic characteristic of compression.

The moulding of hollow articles by blowing a plastic material into shape (blow moulding) underwent radical changes and opened many possible markets for plastics in the container and ornament trades.

An innovation was frictional welding of thermoplastics. This method heated thermoplastics for welding by rubbing the two pieces together at high surface speeds and quickly applying a pressure of about 300 lb. per sq.in. for a few seconds.

The year 1945 also marked the lifting of secrecy on such important outlets for plastics as radar, the proximity fuse, rockets, protective armour for personal use, the T-44 frangible bullet, the M-74 incendiary bombs and the No. 77 smoke grenade. Other military uses included surgical instruments and dressings, prosthetic devices and impreg-

nation for map paper.

Reconversion.—Plastics were in the forefront of reconversion in 1945-46 because the industry's mechanical difficulties in changing over to civilian production were minute. The impact was evident in the textile industry, where plastics were used as synthetic fibres, for impregnation and surface treatments; in the shoe industry, where millions of pairs of plastic soles were consumed annually; in household items, and in automotive, electrical, boat and building industries to mention only a few.

By the spring of 1946, it was evident that while the total output of plastics was running almost two to one compared to 1941, the demand for most plastic products exceeded the supply by an average of three to one. In addition to the world-wide demand for civilian goods and the stimulation of accumulated savings and high wages, the plastics raw-materials producers faced pressure from a vastly expanded moulding and fabricating industry eager to meet consumer requests for plastic merchandise. Every effort was made to increase the already enlarged materials productive capacity, but the fall of 1946 found the supply situation still critical.

In spite of this basic supply problem the plastics industry continued its march toward leadership in world industry. The first national exposition of plastic products held in New York city in April 1946 displayed to the world how far plastics in general, and the United States production in particular, had advanced. Civilian applications predominated although due credit was accorded wartime accomplishments and their influence on raw materials and equipment development.

Throughout 1946, this was reflected by applications in diverse fields including industry, business, home appliances, radio, housewares, toys, fashion, home decoration, packaging, sports and innumerable others.

One of the most extensive outlets was upholstery for furniture and automobile coverings, which made use of supported and unsupported sheeting, films, coated fabrics and woven, extruded, monofilaments. Vinyl resins and their derivatives had become the leading plastic in this field because of inherent physical properties such as resistance to grease, oil, water, etc., and because of comparatively large supply. In addition to upholstery, wider markets for plastics in textiles were indicated in the use of resin impregnants to prevent shrinkage, to impart greater mould, fire and water resistance and to make colours fast.

Of particular significance in the textile field also was the extension of the comparatively new method of coating with polyvinyl chloride latex, which eliminated the use of hazardous and expensive organic solvents and the need for solvent-recovery equipment. The adaptability of these resins to the solution coating of fabrics, fibres and paper provided an important advance in combining plastics with other raw materials.

Among new materials introduced was a modified polystyrene moulding powder (Plexene), combining higher heat-resistance, greater strength, improved machining qualities and better weathering characteristics with many of the excellent properties already demonstrated by the styrene polymers.

A new polyvinyl-type resin for conversion into supported or unsupported film, moulding, extruding, calendering or laminating compounds was introduced by a prominent aircraft manufacturer.

Regular production of acrylic contact-laminates on a continuous basis was achieved by a west coast manufacturer. Fabric or paper, containing colour and design, impregnated with polyester resin, was laminated to acrylic

sheet and came out of the machine ready to be formed either flat or in shapes. The material could be formed with standard dies of wood, plaster, light metal or plastic into bowls, trays, architectural panels, displays, signs, lighting fixtures, maps, etc.

A new, low-cost wood-fibre base plastic was developed (Duron) for use in trays, holders, toys, displays, furniture, etc. Composed essentially of ground wood fibres, plasticizers and other chemicals, it could be formed at high temperature and pressure into flat sheets and other shapes. The material resembled dense hard wood burl, having a mottled low-gloss surface.

A series of cold moulding compounds in brilliant, fast, opaque colours were introduced which could be cold-

Numerous marine and military uses were found for plastic rope, braided with strong filaments of Saran, during World War II

moulded automatically with no heating or after baking. These compounds could be either thermoplastic or thermosetting and could be formed cold, with or without subsequent baking, on standard hydraulic equipment.

Tetrafluoroethylene, an industrial resin with the trade name Teflon, while still in the pilot plant stage, was expected to find a place where heat endurance, unusual resistance to solvents and corrosive agents and good high-frequency insulation were required. Some of the first applications were coaxial cable spacers, gaskets, valve packings, tapes, rods and cylinders. The outstanding properties of this material were its toughness over a wide range of temperatures, its electrical properties over a wide range of frequencies, its extreme chemical inertness and its heat resistance.

Better, stronger and more economical cotton yarns were made, using a new resin impregnating process. The new method, known as Fiber-Bonding, by preventing the

slippage of one cotton fibre along another parallel fibre, was said to increase tensile strength. Conventional processes such as spinning, spooling, warping and twistings were said to be eliminated by this new method.

Structural core materials such as honeycomb core structures, low-density cellular cellulose acetate (C.C.A.), continued to receive attention for insulation and high-strength applications. Low-pressure and contact resin laminates appeared in many applications ranging from artificial legs, arch supports to decorative table tops and boats.

One aspect of the interrelation of plastics to other industries was the amalgamation of the rubber and plastics industries, principally through the addition of such plastics as the polyvinyls to the synthetic rubbers. The combinations showing the most promise were mixtures of vinyl chloride-type polymers and acrylonitrile-type synthetic rubbers. The improved product showed increased flex life, better sunlight and ozone resistance, reduced flammability, reduced creeping in light-loaded stocks and improved abrasion resistance.

Processing and machinery kept pace in 1946 in speedier, more efficient production methods. Cellulose ester plastic sheeting was produced in continuous sheet form in widths up to 24 in. by straight-line operation, using a standard extruder and several sets of rolls.

Great Britain.—Throughout World War II, Great Britain was plagued by the lack of materials, proper equipment and many other essentials for successful plant operation. Nonetheless, the British plastics industry turned out a wide variety of complex plastic parts, many of which duplicated United States articles for war and essential civilian use. There was, however, no comparison in total output.

Britain's shortages had its compensations. From them came an increased knowledge of the wide range of use to which plastics could be adapted—and the ability to substitute one plastic for another. For example, when polystyrene moulding powder (90% of which had formerly been imported from Germany and almost the whole of the remaining 10% from France) became practically nonexistent, many British wartime products were moulded of cellulose acetate or the newly developed polythene.

The scarcity and high cost of raw materials further stimulated British research in the utilization of waste fibres and low cost fillers to extend plastics. Increasing amounts of coconut shell flour were used, partly because of shortages in the supply of walnut shell flour. There was great interest in reinforcing materials, and wood waste and lignin were studied for postwar home construction and other building purposes.

Even though about 95% of British plastics production went into military goods for over six years, the industry co-operated closely with the United States in the exchange of general information and "know-how," as well as details of producing war matériel. A complete range of plastics was produced and it was probable that, with Germany out of the picture, Britain would be in second place in world plastics production.

England was somewhat behind in plastics manufacturing progress, since it could not develop the extensive mass production and exploitation of plastics that were possible in the United States because of the latter's proximity to raw materials supply. Furthermore, compared to the United States, British plastics machines were far less in number, more antiquated and smaller in capacity. In many in-

stances, wartime makeshifts were still in use at the end of 1946.

Nonetheless, the ingenuity and experience gained in war was turned to advantage in civilian products, and the industry expanded in all directions. One outstanding large-scale application of plastics was the remodelling of railway car interiors.

A widespread educational program was launched to inform both the manufacturer and public alike of the new and old materials in the ever-expanding plastics family. Extensive projects were afoot also to expand first the basic chemicals available for plastics by the formation of joint British-American companies and by the use of United States production methods. British manufacturers worked in close collaboration with U.S. suppliers of raw materials to further developments and techniques.

Prices of most plastics in Britain were from 50% to 300% higher than in the United States. This limited their use and accounted for the prewar trend to use plastics as relatively expensive materials. The advance in productive capacity and the addition of new versatile plastics plus the passage of the Anglo-American Trade and Financial agreement suggested that British plastics development would proceed on a more extensive basis and products would become more reasonable in price.

Germany.—Developments in the German plastics industry during the war period 1939–45 were surveyed by Allied investigating groups who released a series of detailed technical reports distributed by the United States department of commerce and the Canadian national research council.

Some of the new plastics described which had not been manufactured in the Allied countries were: polyurethanes, polyvinyl esters and polyethyleneimine as well as many different types of copolymers of vinyl chloride, styrene and acrylic esters. It was also revealed that Germany had developed a method of manufacturing polyvinylpyrrolidone, a polymer with the unique property of solubility in both water and organic solvents. More than 300,000 units of a 2.5% solution of this polymer were administered to German wounded as a blood substitute.

A synthesis of acrylic derivatives directly from acetylene, carbon monoxide and compound with labile hydrogen atoms was of interest as a possible factor in decreasing production costs for plastics of this type.

The general impression of the German plastics industry was that it was well advanced, particularly with regard to raw material manufacturing process and fabricating techniques other than moulding. There was a wealth of compression presses, mostly conventional, but there were no novel compression methods. In injection moulding, Germany was inferior to the Allies and used only small capacity equipment. There was considerable activity in extrusion.

In finishing, the Germans displayed some very ingenious mechanical-drill jig setups, and there were many fine examples of toolmaking.

In the field of transparent sheeting, one unique process was the formation of thin film by a stretching process using polyvinyl chloride. German methacrylate was found to be less subject to crazing than that made by the Allies, but on the other hand the German product caused trouble at high altitudes. A new forming method, known as liquid forming, utilized the force of gravity associated with hot glycerin, poured in portions of shapes during form.

In laminating, paper phenolic laminations were widely

used and to a smaller extent, cloth. The Germans tended to use laminating stock in compression moulds to form products rather than fabricate stock sheets. Plastic bearings were available in stock sizes.

Since leather was critical, three types of plastic substitutes were made—polyvinyl chloride, polyurethane and polyvinyl acetate. These were used for belts in power transmissions and large conveyors as well as for shoe soles. Expanded or porous plastics were widely used for military purposes as insulation against electricity and moisture. Foamed plastic was also used for life jackets.

While most plastics known to the Allies were in large-scale production, one exception was cellulose acetate butyrate. The Germans had not advanced in practical application of the silicone and fluorine plastics to the extent that the Allies had. Nylon was well known, although the polyurethanes, superior in ease of dyeing, competed closely with it.

The German plastics industry was based on the maximum use of soft bituminous deposits and the chemical production of bulk plastic materials was extensive.

Canada.—Five years of war gave great impetus to Canada's plastics industry although its activities were still largely confined to fabrication and the bulk of its raw materials still imported. The war forced great extensions to existing plants, brought about a vast improvement in engineering skill and manufacturing knowledge and added the names of about 40 firms to the prewar list of Canadian plastics fabricators. In 1946, there were only four or five companies producing raw materials, and the bulk of moulding powders and other raw materials continued to be imported from the United States.

Phenol-formaldehyde manufacturing facilities were expanded, and there were new plants for the manufacture of vinyls, nylon, lignin plastics and laminated paper.

During the last four years of the war, Canadian plastics fabricators produced in great quantity transparent aircraft parts by drawing, blowing and forming, and supplied complex parts for the Mosquito and Lancaster bombers.

Numerous other intricate moulded and laminated parts were developed for military purposes, including periscope housings, instrument cases, binocular parts, Sherrill compasses, No. 69 hand grenades, etc.

Other phases of the plastics industry also increased in scope—synthetic resin adhesives, extrusion, wire coating, low-pressure moulding and laminating. There was close co-operation with the plastics industry in the United States on technical matters, interchange of information and public education.

The plastics industry had a firm foundation in the dominion and, while stock mould products and proprietary items (radio parts, buttons, toys, razor sets, etc.) still led in bulk production, custom-made products were on the rise.

Australia.—Prior to World War II, there were about 70 manufacturers in Australia moulding phenolics, but the war brought about a great increase of "backyard workshops," plastics departments added to engineering firms, as well as plastics fabricators. Though quantitatively small when compared to some other Australian industries, the plastics group contained an impressive number of firms engaged in compression, injection, extrusion moulding, laminating, etc. Methods and machinery were generally up-to-date.

Except for phenolics, raw material production was inadequate, principally because of the lack of a flourishing organic chemical industry, insufficient fundamental chemicals, and practically no cheap hydroelectric power. Thus,

most raw materials were imported, although the industry carried on an active campaign to reduce the cost of chemical and other imports vital to plastics production.

Latin America.—Latin American countries had been large importers of plastics, since more than half of the countries neither manufactured plastic materials nor produced semi-finished forms of plastics. The moulding industry mushroomed in the period 1942–46, although the initial impetus came in 1937 with the importation of German injection machines and polystyrene. After World War II, new machinery was bought, particularly automatic injection, and both foreign and domestic capital encouraged domestic production.

Latin American countries producing their own plastic materials, either wholly or in part, from local raw materials in 1946 were Argentina, Brazil, Chile, Colombia and Uruguay, with Argentina leading in output. Peru, Venezuela and Cuba manufactured no raw plastics but produced some finished plastics from imported materials.

Brazil imported \$92,000 worth of U.S. plastic materials in 1944, but later a few firms in Brazil attempted to produce synthetic resins using cresylic acid as a substitute for phenol. Prior to the war, about 185 tons of phenolic resins were produced annually and alkyd and urea resins also were made to some extent, although the bulk of consumption requirements was normally met by imported prepared resins and moulding powder.

Chile, a large fabricator of plastics, imported \$221,000 worth in 1944. Her minimum annual consumption requirements were estimated at about 1,000,000 lb. The only raw material produced was casein plastic in limited quantities.

Mexico became a big importer of cellulosic plastic materials and alkyd resins as well as other raw materials from the United States, as normal annual consumption of all plastics materials was over 2,000,000 lb., including resins for the coating and plastics industry. Prior to the war, phenol-formaldehyde resins for moulding were produced, and there were postwar plans for expansion of raw materials capacity. The plastics moulding and finishing industry represented an investment of about \$10,000,000, principally in injection and compression presses.

Cuba did not produce raw materials but after 1940, the moulding and fabricating industry increased considerably, particularly concentrating on smaller products such as buttons, combs and accessories.

Colombia had only one manufacturer of plastic materials in 1946, and that firm made phenolic moulding powder for its own use. There were about eight moulders in the country, and both injection and compression techniques were used.

Uruguay remained backward in its use and production of plastics, casein being the only plastic manufactured. However, a phenolic plastics industry was under development in 1946.

Peru produced no plastic materials and very few finished plastic products, the latter, principally, buttons, novelties, etc. Other importers of plastics in extremely small quantities included Ecuador, Costa Rica and Paraguay. None of these had moulding facilities but used the materials principally in paints, coatings and some fabricated articles. Platinum Group Metals

Palladium, iridium, osmium, rhodium and ruthenium are so closely associated with platinum that world production must be reported as a group. Table I includes all of the leading producers except the U.S.S.R., where the unreported output was variously estimated at 100,000 to 150,000 oz. annually. A number of minor producers had outputs varying from a few ounces to a few thousand.

‡Crude.

§Crude from ores and concentrates; ordinarily the total is increased about 10% by recoveries of osmium in gold mining.

||Total crude and refined.

Previous to 1914, the Russian output constituted 90% or more of the world total, but the industry became so disorganized during World War I and the subsequent revolution that it did not regain its former level. During the late 1920s and early 1930s the soviet share varied widely, but averaged about half of the total. Then Canada developed into a heavy producer, and apparently was in the lead most of the time, but with the soviet output

unreported the exact status could not be determined. The United States did not become a producer of appreciable importance until 1938. Salient statistics relating to the platinum group metals in the United States are presented in Table II.

The United States had never been a heavy producer of platinum, but after 1938 was able to supply about 10% of its needs. The remainder of the supply was imported, mainly from Canada, either directly or after going through the refinery in England; the U.S. also received practically all of the Colombian crude, and up to 1943 received moderate amounts of the soviet output.

Figures in Table II emphasize the increase in demand during World War II, but even more strongly the shifts in uses that followed the development of war demands. The use of platinum was barred in jewellery, formerly the heaviest consumer; the chemical industry showed the earliest response to war demand, and while appreciable expansion did not come in the electrical industry until later, the peak was higher, so that in 1943 the electrical industry absorbed 54% of the total sales, as compared with 38% in the chemical industry, and 8% in dental and surgical uses. Postwar demand developed so markedly that the price of platinum rose from \$35 beginning in May 1946, to \$90 in October, declining to \$70 in November.

The uses of platinum are too numerous to list in detail, but some of those that contributed most directly to the war program were: contacts for a wide variety of electrical equipment; detonator fuses; electronic tubes for radio communication and radar; spark plug electrodes; parts for bomb sights and computing devices for remote control of machine guns; catalyst in the production of nitric and sulphuric acids; spinnerets and bushings for rayon and glass fibres; and electrodes in a number of electrolytic operations.

Palladium went through a transition that in some ways was even more spectacular than that of platinum, as the relative increase in demand was greater, largely because palladium was used to a greater extent than ever before as a substitute for platinum, as well as for its own specific uses. The demand in dentistry, already well established as the largest use of palladium, saw little change, the bulk of the increase being divided between electrical uses and jewellery, largely as a substitute for platinum.

It is to be noted that while the sales of platinum in 1945 were slightly less than in 1943, the sales of palladium were 35% greater, with sharp increases in both electrical and jewellery uses. In fact, the consumption of both platinum and palladium in 1945 were record high figures.

(G. A. Ro.)

Pla y Deniel, Enrico

Cardinal. Pla y Deniel (1876–), Spanish prelate, was born Dec. 17, 1876, at Barcelona, Spain. He was ordained at Rome in 1900 and was a professor in the seminary of Barcelona until his consecration as bishop of Avila. Transferred to the diocese of Salamanca in 1935, he was elevated to the primatial see of Toledo in 1941.

Msgr. Pla y Deniel was active in social welfare and worked for the betterment of the working classes. Under the republic, he was subjected to adverse demonstrations, but the president, a socialist, had publicly announced his admiration for the prelate, then Bishop of Avila.

On Sept. 2, 1945, he issued a pastoral letter which endorsed the regime of Gen. Franco, but denied that the Catholic Church favoured totalitarianism. "We affirm

solemnly that the church in Spain has kept perfect neutrality," the primate's letter said.

He was named to the College of Cardinals, Dec. 23, 1945, and was created and proclaimed cardinal at the consistory on Feb. 18, 1946.

Pneumonia

For some time prior to the beginning of the eventful decade 1937–46, there had appeared a decidedly downward trend in the mortality rate from pneumonia in the United States. The causes of this trend were not known, but it was probably related to the general improvement in the health, welfare and medical care of the population, as evidenced by the similar but less striking trend in the death rates from all causes and particularly in those from tuberculosis. The accompanying table shows the death rates for an average of more than 20,000,000 policy holders of the Metropolitan Life Insurance company and for more than 7,000,000 inhabitants of New York city. The major drop in death rates from pneumonia was not the result of a reduction in the incidence of the disease. It occurred in some years in spite of an actual increase in the incidence of the disease and it began before the advent of effective curative agents.

Death Rates from All Causes and from Pulmonary Tuberculosis, and Pneumonia (All Forms) 1930–45
Deaths per 100,000

Year	Industrial Policy Holders*			New York City†		
	All Causes	Tuberculosis, respiratory	Pneumonia (all forms)	All Causes	Tuberculosis, pulmonary	Pneumonia (all forms)

*Statistical Bulletin, Metropolitan Life Insurance company.

†Quart. Bull., Dept. Health, City of New York. The published death rates for "All Causes" are given per 1,000 and are here changed to conform with the others. The last figure, therefore, is not significant.

‡Figures for 1942–45 inclusive are corrected by exclusion of "war deaths."

That the widespread use of sulfonamide drugs and, later, of penicillin markedly affected the mortality from pneumonia could not be doubted. Evidence on this point came from several sources. Large general hospitals reported case-fatality rates of one-half to one-third or even less when compared with the mortality from the disease in the pre-sulfonamide era. The first evidence of a reduction in the death rate on a large scale came from the native labourers in the South African gold mines. Among them pneumonia was always a major cause of death and disability. Data from these areas were especially reliable since all employees were given prompt medical attention for all illnesses and continuous studies of the disease had been carried on for a number of years. In one group of gold fields in the Witwatersrand, where an average of about 300,000 native labourers were employed, the incidence of pneumonia during the years 1934–39, inclusive, remained fairly constant, between 25 and 30 per 1,000. During the years 1934–37, the case-fatality rates also stayed quite steady, between 10.0% and 11.2%. This mortality

dropped sharply to 3.08% for the year beginning Oct. 1, 1938, which was the first year when an effective sulfonamide drug—sulfapyridine—was employed. In a survey among industrial employees carrying group health and life insurance, the average case-fatality rate from pneumonia for the pre-sulfonamide years, 1935–37, was 20.8% as compared with 3.9% during the period from Jan. 1939 through May 1942, when effective sulfonamides were available and were widely used. Even more striking reductions in mortality from pneumonia were observed in the armed forces of the United States during World War II as compared with World War I. In one large naval hospital, 1,265 consecutive cases of pneumonia were observed and treated during a four-month period in 1945 without a single death.

Tremendous forward strides were made in the field of antibacterial therapy during the decade. These advances fell into three distinct categories: (1) immunotherapy, *i.e.*, specific serum therapy; (2) chemotherapy, which includes chiefly the sulfonamide drugs, and (3) antibiotic therapy, mainly with penicillin and streptomycin. Except in the case of streptomycin, the results obtained with these successive forms of treatment were progressively better, and their beneficial effects were about as striking in pneumonia as in any other infectious diseases. Since these were curative forms of therapy and were in varying degrees specific in their action, they effected a progressive drop in the case-fatality rate from pneumonia in proportion to the range of their effectiveness against the different causative organisms.

Serum Treatment.—The first serious attempt at serum therapy of pneumonia was made possible in 1912, after it was discovered that the pneumococcus consists of a group of related organisms which could be separated into specific types. The three most common types were readily identified. During and immediately after World War I, minor successes were achieved in the development of type I antipneumococcus serum in horses, and some cases caused by this organism were treated. The results, however, were not brilliant; the treatment was cumbersome, large volumes of horse serum had to be given intravenously and untoward reactions were frequent and severe. The identification of the pneumococcus obtained from the patient was laborious and time-consuming, and the efficacy of treatment diminished rapidly as the disease progressed.

Up to 1937, progress was along the lines of improving the serum treatment. New methods of concentrating and refining antipneumococcus horse serums resulted in more potent preparations which were easier to administer and caused fewer reactions. Meanwhile, many additional types of pneumococci were recognized although only a few of them proved important as a cause of pneumonia. It then became possible to influence additional types of pneumococci and the scope of this form of treatment increased. Methods were also developed for rapid typing, including direct typing of pneumococci from sputum. Specific serum could then be given earlier in the disease, and its effectiveness was thereby increased.

Serum treatment reached its peak in 1937 and 1938 with the use of antipneumococcus serums prepared in rabbits. Small volumes of highly concentrated and refined rabbit serums proved much more effective than larger volumes of horse serums, and fewer reactions were encountered. Furthermore, it was possible to prepare such serum against all types of pneumococci. At about this time, public interest in the serum treatment of pneumonia increased. In Massachusetts, with the co-operation of the department of health, diagnostic facilities had been made available for

prompt typing throughout the state, and serums were provided for treatment without cost. Several other states soon followed suit and this form of therapy was increasing in popularity just at the time when the sulfonamide drugs made their appearance.

Treatment by Chemicals.—Up to this time very little progress had been made in the use of chemicals for the treatment of pneumonia. Some derivatives of quinine had proved effective in the test tube, but were too toxic in the doses required for therapy. One derivative, hydroxyethylapocupreine, gave encouraging results in pneumococcal pneumonias and received a limited trial in Pittsburgh, but proved less effective than sulfapyridine.

In 1937, sulfanilamide was first generally used against haemolytic streptococcal infections. During the next four or five years new derivatives of this chemical were introduced which were considerably more effective and less toxic. Cases of pneumonia caused by a haemolytic streptococcus were successfully treated with sulfanilamide, but this compound proved only slightly effective against the pneumococcus. Reports appeared of successful treatment in cases of type III pneumococcus pneumonia which previously proved refractory to serum therapy. Occasional cures in cases of meningitis caused by this and other types of pneumococci were also reported for the first time with the use of sulfanilamide, both with and without specific antisera. Serum alone and all other forms of treatment proved ineffective in pneumococcal meningitis, which up to this time was a universally fatal disease.

In 1938, the first important derivative of sulfanilamide—sulfapyridine—was introduced in England under the trade symbol M. & B. 693. This compound was highly effective against all types of pneumococci and at least as effective as sulfanilamide against haemolytic streptococci and other bacteria. The sharp reduction in the case fatality rate which resulted from its use in pneumonia has already been mentioned.

Sulfapyridine, however, gave serious side reactions which frequently made it difficult to tolerate and sometimes necessitated its discontinuance before a full therapeutic effect was achieved. Most frequent was the severe nausea and vomiting which often made it impossible to continue the medication by mouth. A soluble sodium salt was then introduced which permitted administration by injection, but did not alleviate the symptoms. Because of its poor solubility and because it is excreted almost quantitatively in the urine, sulfapyridine tended to produce kidney damage through precipitation of the crystals and this was accentuated through loss of fluids caused by vomiting. Other toxic reactions such as fever, rash and serious effects on the blood were observed after more prolonged treatment. Serums were still used to some extent in suitable cases either to supplement the sulfapyridine or when the latter could not be tolerated.

Sulfathiazole and sulfadiazine were introduced during the following two years and proved to be much less toxic and considerably more effective in the pneumonias caused by pneumococcus and haemolytic streptococcus. They were also more effective than the earlier compounds in cases of staphylococcal pneumonia, but had little if any effect in pneumonias caused by such less common organisms as Friedländer bacillus and influenza bacillus. Renal complications and other toxic effects were less frequent than with sulfapyridine. Some patients, however, could not tolerate even these newer drugs and others developed a sensitivity to them so that their continued administration,

or subsequent treatment with them, when required, was accompanied by severe reactions. Sensitization was most frequent with sulfathiazole.

Other sulfonamide compounds were also introduced, but sulfadiazine remained the drug of choice in the treatment of pneumonia both from the point of view of its efficacy and its relatively low toxicity. Others, particularly sulfathiazole and sulfamerazine, were used to some extent. The latter is a monomethyl derivative of sulfadiazine which is rapidly absorbed, but more slowly excreted than sulfadiazine and can therefore be given at less frequent intervals. Sulfadiazine and sulfathiazole proved much more effective than specific antiserums, their use involved much less trouble and expense and they gave fewer reactions. Furthermore, since the sulfa drugs were about equally effective against all types of pneumococci, typing prior to treatment was no longer essential and this procedure, though valuable for other reasons, was largely discarded.

Penicillin and Streptomycin.—Penicillin was first introduced for limited clinical trials during the latter half of World War II, and became available for general use after the middle of 1945. In the pneumonias, its range of effectiveness largely overlapped that of the latest sulfa drugs. The results in cases of pneumococcal pneumonia were comparable with both agents. Penicillin may be slightly more effective than the sulfa drugs in streptococcal pneumonias, but it proved to be much more effective in staphylococcal pneumonias. The latter require treatment with larger doses and for longer periods than those used for pneumococcal pneumonias.

Penicillin was found to be essentially devoid of serious untoward effects and thus had a great advantage over the sulfa drugs. Unlike the latter, which were usually given by mouth, penicillin should be given by injection in order to be certain of obtaining its full therapeutic effect. Oral penicillin proved effective in cases of pneumonia when given in much larger doses and at more frequent intervals than those used for injection. The oral method, however, could not be relied upon in the most serious cases. Penicillin could be given to persons who did not tolerate the sulfa drugs because of sensitivity or because of kidney disease. In patients with heart disease in whom fluids must be restricted, penicillin proved advantageous since large amounts of water must be given with the sulfa drugs in order to avoid kidney complications, whereas penicillin, which is also excreted largely through the kidney, was better retained and, therefore, more effective because of restricted fluids.

Various combinations of antisera, sulfonamides and penicillin were tried in pneumococcal pneumonias. There was little to choose between penicillin and sulfa drugs in the great majority of these cases. Fever and symptoms subsided and the process in the lungs cleared in about the same time with each of these agents. However, serious complications such as empyema of the pleura were somewhat less frequent with penicillin treatment and yielded to local treatment with this antibiotic more readily than with sulfonamides, so that operations for drainage were more often avoided. In the severest cases, particularly in aged persons with other complicating diseases, penicillin seemed to have the greatest advantage and probably saved more lives than the sulfa drugs. The combination of penicillin with sulfadiazine was the most effective in the pneumococcal pneumonias. Specific antipneumococcal sera as an adjuvant to either penicillin or the sulfa drugs proved much less useful in reducing the death rates.

Another effective antibiotic was streptomycin. This agent was found to be active in the test tube against many bacteria which were not affected by penicillin. Among those which may cause pneumonia are the Friedländer's bacillus and influenza bacillus. A few cases of pneumonia caused by these organisms were treated with streptomycin, and most of the results were favourable. This antibiotic, however, proved to be not quite so free of untoward effects as penicillin and it was also much less effective. Furthermore, organisms originally sensitive to this agent often became resistant quite rapidly during the course of treatment. This phenomenon of "fastness" acquired during therapy was observed only very rarely with the sulfa drugs or with penicillin.

Failures to obtain satisfactory cures in cases of bacterial pneumonia became much less frequent but they were still encountered at the end of the decade. Among the chief causes of these failures were: (1) the presence of other serious diseases, (2) delay in the institution of treatment until irreversible changes had taken place in the structure or function of the tissues, (3) the development and progression of complications not affected by the treatment, (4) causative organisms which are resistant to the action of the antibacterial agents or which become resistant during treatment, and (5) secondary infections with resistant strains.

Prevention.—Some progress in the prevention of pneumonia was also made during the ten years. In the earliest attempts among the native labourers in the South African goldfields and in the United States army in World War I, the use of vaccines made from whole organisms and incorporating the most prevalent type of pneumococci resulted in some reduction in the pneumonias caused by those types. The incidence and mortality from pneumonia as a whole, however, was influenced only slightly. In 1929, it was shown that the purified capsular carbohydrate of the pneumococcus which is responsible for its type specificity was by itself capable of stimulating antibodies against the corresponding type of pneumococcus. The results of one large experiment with immunization by the injection of the specific carbohydrates of types I and II pneumococci were published in 1938, and suggested that some protection was obtained. Localized institutional outbreaks of types I and II pneumococcal pneumonia were brought to an abrupt end by the use of vaccines prepared from the whole organisms or by the type specific carbohydrates of the same types. Later, immunization with a single injection of the capsular polysaccharide fraction of pneumococci of four common types was shown to have some effect in preventing pneumonias caused by these types. The carrier rates for the same types were also reduced in the immunized group. Pneumonias due to other types, however, were not prevented.

Attempts to prevent pneumonia by the continuous administration of small doses of the sulfa drugs given to large groups of individuals did not prove to be effective. The spread of sulfonamide-resistant strains of streptococci and outbreaks of infections with these strains were reported where such prophylaxis was widely used. The development and spread of resistant strains of pneumococci in a small group of institutionalized patients who were subjected to sulfadiazine prophylaxis was also observed. There were no reports on the use of penicillin as a prophylactic.

All the methods of prophylaxis and therapy emphasized the importance of the causative organism in pneumonia. Previously, the pneumonias were classified on clinico-anatomical grounds as either lobar pneumonia or bronchopneumonia. The use of serum emphasized the im-

portance of recognizing the pneumococcal pneumonias and of determining the "type." Chemo and antibacterial therapy caused a shift in emphasis so that the diagnosis of the species of bacterium causing the disease and the susceptibility of the strain to the antibacterial agents became of primary importance in management. Because the determination of the causative organism and its susceptibility to antibacterial agents required considerable delay, treatment was usually started on the basis of the clinical findings and then altered as indicated when the results of the laboratory tests became available.

A nation-wide study of the bacterial aetiology of the pneumonias was undertaken during a two-year period ending Sept. 30, 1940, and covered over 30,000 patients. This survey showed that three-fourths of all the pneumonias were caused by pneumococci and that three-fourths of the pneumococcal pneumonias were caused by ten common types of pneumococci. Streptococci and staphylococci together accounted for about 6% of the cases. Friedlaender bacilli and influenza bacilli were equally prevalent, but together accounted for only 0.3% of the cases. No significant bacterial agent was recorded in about one-sixth of all the cases. This study, however, was made with methods which were designed to reveal the pneumococci and their types and emphasized the occurrence of these organisms. It probably did not represent the true picture since pneumococci may be identified in the throat and sputum even when they play no significant part in the causation of the pneumonia.

Nonbacterial Pneumonias.—During the decade, the failure of large numbers of cases of pneumonia to respond to any form of antibacterial therapy brought to the fore still another group of pneumonias, those caused by nonbacterial agents, including filterable viruses and rickettsias. There had previously been indirect evidence that such nonbacterial agents could produce pneumonia, particularly as part of systemic diseases. In 1930, however, the virus of psittacosis was discovered and was definitely identified as the cause of "parrot fever," a disease acquired from sick parrots and having as an outstanding feature an atypical pneumonia. Many viruses related to that of psittacosis were later identified as the cause of disease or as normal inhabitants of various animals and birds and from some of the latter, infection was transmitted to humans. Infected pigeons in particular were implicated as a source of a few cases of so-called "ornithosis" in humans. Small outbreaks of pneumonia caused by other related viruses were reported from Illinois and from the Bayou regions in Louisiana. Still others were identified as a cause of pneumonia in cats and may have been transmitted from these animals to humans. Only occasional strains of these viruses proved susceptible to the sulfa drugs or to antibiotics.

The viruses of influenza may also cause pneumonia. The agent which caused the influenza epidemic of 1918 was not known, but pneumonia was an outstanding cause of death during that pandemic. Haemolytic streptococci, the influenza bacillus of Pfeiffer, pneumococci and staphylococci were found, and one or another of these bacteria predominated in the pneumonias that complicated the influenza in different localities, but occasional cases were described in which no pathogenic bacteria could be found after careful search.

With the discovery of a virus in influenza in 1933, and the recognition of types A and B influenza viruses as the cause of most of the influenza outbreaks after that time, it was shown that these viruses alone can produce pneumonia in animals and in man. In most susceptible ani-

mals, the virus of influenza alone under proper conditions produces extensive and fatal pneumonia. In the swine, however, it was found necessary to have a combination of an influenza virus and a strain of influenza bacillus to produce pneumonia. The virus alone produced an upper respiratory tract infection with systemic symptoms similar to uncomplicated influenza in humans while the influenza bacillus alone produced no illness. In man, occasional cases of extensive and even fatal pneumonias caused by influenza virus have been recognized in which no significant bacteria were found. Fatal cases of pneumonia were proved to be due to the virus of lymphocytic choriomeningitis and some were thought to be caused by the viruses of chicken pox and measles.

The rickettsias which cause typhus fever and other diseases may produce pneumonia in severe cases. A disease called Q fever (for Queensland in Australia where it was first recognized) was shown to be caused by a new rickettsial agent. The disease as first described was similar to severe influenza, but the same agent was also found in the southwestern United States and in central Europe, where it gave rise to severe forms of pneumonia. The rickettsia of Q fever was found in various wild and domestic animals and was isolated from ticks and the insects which probably serve as vectors. Sporadic cases caused by this agent were recognized in Montana and Wyoming, and outbreaks of Q fever occurred among laboratory workers in the United States and Australia and among troops in Italy, the Balkans and in southern United States. The sulfa drugs and antibiotics were found to have no effect in this disease or in any of the other virus or rickettsial pneumonias except when they were complicated by infection with susceptible bacteria. All of the known viruses and rickettsias together, however, accounted for only an insignificant part of the cases commonly diagnosed as virus pneumonia.

Finally, a large group of cases of pneumonia was recognized in which none of the pathogenic bacteria, viruses or rickettsias could be implicated. These cases occurred mostly in adolescents or young adults, had all the characteristics of virus diseases, and were called "virus pneumonia." In the U.S. army they were labeled "primary atypical pneumonia of unknown aetiology." They probably represent a group of diseases with a characteristic clinical course of varying severity, the more severe ones resembling psittacosis. A few fatal cases were reported, and the pathological picture resembled that of other virus infections. Two distinctive features were recognized in many cases. The serum in many cases was found to develop the property of agglutinating human red blood cells of all groups in the cold (cold agglutinins). In some of the same cases and in certain others, the serum also developed the property of agglutinating certain strains of nonhaemolytic streptococci. These cases likewise failed to respond to the sulfa drugs and to antibiotics unless they were complicated by susceptible bacteria.

The virus nature of this disease was proved by direct experiment. The disease was transmitted to human volunteers by the use of filtered and unfiltered sputums obtained from cases, but not by boiled sputum. Attempts to transmit the agent to animals with similar materials usually failed. Many virus agents were isolated in animals inoculated with such materials from human cases, but in most instances it turned out that these viruses originated in the animals themselves and were propagated during the subsequent passages. In the case of only one of these viruses was

584 proof of its relationship to the human diseases brought forth, but this still lacked adequate confirmation at the end of the decade. (See also X-RAY.)

Poetry

The chief event in the field of poetry in England and in America during the earlier part of the 20th century had been the appearance of a group of remarkably gifted American poets, who for the first time in history were able to challenge and even surpass the English on their own ground. Up to that time, apart from the achievement of Edgar Allan Poe, Walt Whitman and Emily Dickinson, no U.S. poet had anything of the technical mastery or the intensive power of the Victorians: Alfred Tennyson, Matthew Arnold, Robert Browning, Algernon Swinburne, Dante Gabriel Rossetti, William Morris, George Meredith or Thomas Hardy.

About 1915, the picture had begun to change. Such poets as E. A. Robinson, Edgar Lee Masters, Robert Frost, Carl Sandburg, Vachel Lindsay, Edna Millay, Elinor Wylie, Lola Ridge or Amy Lowell were sure to be ranked in literary history as being more important and vital for the growth of poetry written in English than any of the group known as the Georgians, who so largely dominated the English scene up to 1930. Two years before that date, Thomas Hardy died; and it was then seen by the discerning that only one figure in England was important, the profoundly Irish William Butler Yeats, whose work marked the end of a great tradition rather than the beginning of a new one, though he himself had been, since 1918, in many ways the link between the older generation and the new. Yeats died early in 1939, working up to the last on poems which recall in their mingling of sharp irony, old mythology and classical grandeur of utterance something of the power of Walter Savage

Landor. The rediscovery of Landor, along with that of John Donne and the later Elizabethans and 17th century metaphysical poets, was destined largely to influence all poetry written in England during the eventful decade 1937–46.

The American group mentioned above were, from the outset, committed to the business of exploiting the possibilities of an untried tradition, breaking new ground in both subject matter and form in order to achieve it. In the swift development of what was sometimes called "the poetic renaissance" in America, many other figures besides those mentioned arose, some of them destined to die young. Such, for example, was the case with Hart Crane, whose career was brief and tortured; his most ambitious effort, "The Bridge," a poem attempting to span the significance of American life and history and of Crane's own part as an actor in both, was an impressive but not always fused blend of Christopher Marlowe, Whitman, Herman Melville and of Crane's own personal genius. Crane committed suicide in 1932, but left behind others whose careers were to imply a longer, steadier effort. Such were the New Jersey physician, William Carlos Williams, whose first book had appeared back in 1913; Wallace Stevens, born in 1879 but not publishing a volume till 1923; and Marianne Moore.

Almost the last important American poet to claim wider attention than serious poets can usually get in their lifetimes was the Californian Robinson Jeffers. His *Roan Stallion*, *Tamar* and *Other Poems* had been a sensation of 1923–24. Jeffers' position in regard to the later cross-currents of poetry in both England and in America was unique. In the face of the prevailing drift which had been either toward a poetry more elaborately symbolic, more intellectualized and more mystical, or toward a poetry more informed, by social protest, more political and more violently satirical, Jeffers maintained his complete fatalism as regards politics, and a scepticism amounting to indifference as regards Christianity. His anti-democratic, non-human philosophy (derived possibly from the Greek and Roman Stoics via Nietzsche), his tragic vision of human existence, his pantheism, all set him apart. He remained a powerful poet with no followers; he blended something of his predecessor Edwin Arlington Robinson's irony with an even deeper sense of human tragedy. His fine translation of Euripides' "Medea" showed that he was at heart far more akin to the ancient Greeks than almost any poet of the decade 1937–46.

As early as 1922, the American-born T.S. Eliot had emerged from his self-chosen expatriation in London to create an unforgettable symbol of postwar disillusionment and disintegration, in the famous "Waste Land." Alone among the Americans who had gone overseas in the period 1908–18, Eliot was well equipped to deal with some neglected aspects of the English poetic tradition. As a critic no less than a poet, he found such aspects in Donne, in John Webster and in the metaphysical school of the 17th century, as well as in their successor, John Dryden. To these he added as influences on his own poetry, Dante Alighieri, Dante Gabriel Rossetti and William Morris, and the Frenchmen, Charles Baudelaire and Stéphane Mallarmé. The elements derivable from Jules Laforgue which had appeared in his earliest work soon vanished; and his conversion to the Anglican church reflowered around 1930 in the beautifully organized and musically constructed "Ash Wednesday." Because of his seemingly unflinching technical power, Eliot became the largest single influence in the whole field of poetry, as practised in England. Even those who disagreed with his position or philosophic

grounds were obliged to yield tribute to such ability as was shown in "Four Quartets." His influence in America, being less pervasive, was less decisive; but it persisted.

Oxford Group.—Not having developed primarily under the shadow of the Victorian tradition, but being able as an American expatriate to make whatever use he could of it, Eliot had an advantage over many of the younger generation in England, who were obliged to deal with that heritage at first hand. Such was the case with a small group which began to develop around Oxford in the mid-1920s. The lead which Eliot, with his harshly ascetic realism and his bitter disillusion with his own times, gave them was decisive in producing their break from the pastoralism, the idyllic romanticism of the Georgian group. They saw fit to ignore, for the time being, Eliot's preoccupation with theology as well as the Toryism of his politics. They turned, under his influence, to a poetry which was ironic in regard to the Victorian past, violently partisan in regard to the political present, revolutionary in the Marxian sense in regard to the future.

This group, consisting of Cecil Day-Lewis (born 1904) Wystan Hugh Auden and Louis MacNeice (both born 1907), and Stephen Spender (born 1909) may be said to have ruled the course of English poetry from 1930 to 1940. They succeeded in relegating to the background the individual, less socially conscious effort of the Anglo-Irish Robert Graves, who as early as the 1920s had tried to turn the current of Georgianism into something more realistic and more intellectually satisfying. They completely obscured the work of the South African Roy Campbell, whose best poems showed the influence of Arthur Rimbaud and the great French symbolist Paul Valéry, and whose finest work appeared around 1925-30. But they were unable to quench the talent—also originally more French than English, and in the first instance owing much to Paul Verlaine, Rimbaud, Donne and Alexander Pope—of Edith Sitwell, whom some critics regarded as England's greatest poet. Miss Sitwell, as early as 1929-30, had moved rather sharply away from the glittering artificialities and the wordplay of her earlier poems into a realm of social satire, and of social protest of her own. The first important work of this period in her development was "Gold Coast Customs," a poem which curiously recalled in its rhythms the American Vachel Lindsay, and, in its symbolism, William Blake and Christopher Smart. Later in her "Street Songs" and "Green Song and Other Poems" she brilliantly established herself as an important voice of the years of World War II. Her work was uneven, still over-clogged with detail; but at its best, it was uniquely poignant in the feeling of compassion and indignation aroused in her by the spectacle of her time.

Neither Day-Lewis nor Auden nor MacNeice could be said to be so completely convincing a poet as Miss Sitwell proved herself to be in her best poems; nor did Miss Sitwell reach the point of acknowledged mastery attained by Yeats in his latter years. Perhaps the Oxford group took up, when young, too many political causes; perhaps it was too insistent in arguing for the rights of the Spanish Loyalists or the Chinese in their struggle with Japan (one of the group made a special trip to China to witness the Chinese-Japanese war, and emerged with some sonnets that were clever but not quite convincing enough). In 1939, with England again drifting into war with Germany, Auden, the acknowledged leader of the whole group, migrated to the United States and became an American citizen. He attempted to repeat, for America's benefit, the success Eliot had in London in the late 1920s, by stressing his apparent conversion to Christianity in such works as

"The Double Man" and "For the Time Being." Unfortunately, Auden, with his worldly cleverness, his sheer fertility of invention, his interest in Freudian psychology and modern psychiatry, was the reverse of a religious poet. He merely further confused some important details of the American poetic scene, without resolving them in his own work.

Day-Lewis, MacNeice and Spender remained in England; but of them all, only Stephen Spender showed the possibilities of organic growth. The other two were largely content to repeat, in a key becoming more and more minor, their earliest and best poems. Spender, on the other hand, after carrying his left-wing political and social protest as far as anyone possibly could, suddenly reversed himself and became absorbed in the poetry of the great German, Rainer Maria Rilke (who died in 1926). Rilke as a poet was completely disinterested in any political theme; but as a visionary of the interior life he was the rival, if not the unique superior of the far more fragmentary and earlier Novalis (Friedrich von Hardenberg) and Friedrich Hölderlin. The preoccupation with Rilke, whom Spender ably translated, strengthened and made Spender's own poetry more purposeful.

In addition to certain young poets whose careers were cut short, such as Sydney Keyes and Alun Lewis, the years of World War II certainly produced a remarkable flowering of young poetical talent in England—and also in Wales, Australia and Canada. Scotland had previously been heard from, in the long interval between the two world wars, in such poets as the savagely left-wing Hugh MacDiarmid (whose best work was in Scots dialect) and in the more urbane Edwin Muir (whose work was written in English). The revival in Wales was most important, inasmuch as it produced a vividly lyrical poet, Dylan Thomas, whose poetry displayed a vitality in the handling of language and an intensity of emotion rare in any age. He had a rival in the person of Vernon Watkins, and an opponent of more introspective cast in David Gascoyne. Meantime, certain figures who had emerged from World War I had quietly maintained their positions. This was notably the case with Herbert Read, who was no less important as critic than as poet, and did distinguished work in both world wars.

No Recessional.—In America, despite a complete lapse in public interest, the revival had by no means spent itself at the end of the decade 1937-46. The Fugitive-Agrarian group which centred around Nashville during the period 1924-30, and which came most directly under the Eliot influence, had either dispersed itself or given up writing poetry. Its former leader, John Crowe Ransom, whose work had both irony and charm, had written almost no poetry since 1929; he was too much absorbed in criticism to be able to return to it. Its most brilliant exponent, Allen Tate, continued to write, from time to time, poems that blended Baudelaire, Hart Crane and Eliot; but his lack of facility, his sheer violence of statement, tended to drive him into silence. Robert Penn Warren, the youngest of the group, achieved only a Pyrrhic victory with his "Selected Poems" and the long and not too-convincing "Ballad of Billie Potts," before turning away to his highly successful novel *All the King's Men*. A great number of minor talents appeared elsewhere, stimulated by such college contests as the Hopwood awards at the University of Michigan, or the Yale Series of Younger Poets, which discovered such authentic poets as James Agee, Frances Frost and Muriel Ruykeyser. But in

the main, what came out of American poetry was the work (often done in obscurity) of certain strong and persistent talents.

World War II brought into prominence (as it had every right to do) the work of certain poets whose motives were largely patriotic. Poetry with openly avowed patriotic intentions had not been written in France since the days of Victor Hugo. In England it had lapsed around 1900-10, the best examples being found in Rudyard Kipling and Alfred Noyes. John Masefield was perhaps an exception; but his patriotic poems were surely inferior to "Reynard the Fox" or "Dauber." In the United States, this kind of poetry was most brilliantly written by Stephen Vincent Benét, who died in 1944, and whose two main works, "John Brown's Body" and the unfinished "Western Star" stood foremost in what may be called the field of the American epic. Benét, however, was anticipated by the now forgotten Donald Davidson of Tennessee, whose "Tall Men," published a year before "John Brown's Body," is still worth reading; he was followed—more or less successfully—by such poets as Paul Engle (who apparently abandoned the field), Norman Roston, and a few others. The attempt to transform himself from a sophisticated and aesthetic poet into a mouthpiece of patriotism effectively destroyed Archibald MacLeish's best qualities; it brought to a close the talent of Edna Millay; and it produced such monstrosities of bad taste as Russell Davenport's "My Country" and Norman Corwin's radio broadcasts. It did not seem that this field, despite the preference of many critics for it, was capable of further growth.

More vital to the course of American poetry were the works of Horace Gregory, who, in his "Chorus for Survival" seasoned his patriotism with an appropriate feeling for irony. With his wife Marya Zaturenska (herself a lyricist of distinction) he was the author of the only history of American Poetry covering the ground of the important years 1900-40. More vital, in a lesser sense, was the persistent unflinching voice of Mark Van Doren, critic and anthologist as well as poet (though far more academic than Gregory), who began his writing soon after World War I. More important, and tremendously exciting, was the work of E. E. Cummings, who conducted his unique exploration into the resources of the language with brilliant results, from the day his first poems appeared, around 1920. Considerably more vital was the later, and almost equally experimental Kenneth Fearing, who produced poems of unforgettable poignance in an idiom derived from the city streets, the slums, the industrial quarters of the United States. Vital too, was the indefatigable anthologizing carried on by the modern-minded Oscar Williams; and also the writing of many other young poets, including Karl Shapiro, who was awarded the Pulitzer prize.

But it was upon the older poets, rather than on the younger (though many of the latter showed high promise) that America's fame as a land rich in poetry securely rested at the end of the decade. Nothing was more remarkable in the history of the decade than the persistence with which certain older American poets continued to produce fine and individual work in the teeth of complete public indifference and lack of critical discrimination, and despite reviewers who were academically reactionary, violently left-wing or snobbishly intellectual in their outlook. Thirty years before, the world was just beginning to wonder about the "new poetry" coming out of America. Now wonder gave way to praise before massive achievement.

Five Examples.—Conrad Aiken, born in Savannah, Ga., in 1889, published his first books about the same time as those of Robinson, Frost, Masters, Lindsay, Sandburg, were marking the opening of the American poetry renaissance. In his later poems—"Brownstone Eclogues," "The Soldier" and the fine elegy dedicated to the memory of President Franklin D. Roosevelt, "Crepe Myrtle"—Aiken showed himself to be a poet with a superb ear for tone and rhythm, as well as a philosophic mind of far more importance than his earliest works seemed to promise. His attitude, equally modern but far less dogmatic than that of Eliot, took off from a profound study of psychology as well as a considerable knowledge of history; it derived from an experience which kept him moving back and forth across the Atlantic, between England and America. More akin to the scepticism of Michel de Montaigne in his interest for free enquiry, than to Søren Kierkegaard's desperate attempt to salvage theological dogma, his work after the outbreak of World War II failed to command the attention of the critics; and his extremely personal idiom left him without important followers. His work, however, was to be reckoned with, in a large way, in any history of American poetry in the 20th century.

H. D. (Hilda Doolittle), three years older than Aiken, and also an expatriate American, had been silent for a considerable number of years. Under the pressure of the blitzkrieg of German bombers on London, she produced in 1942-44 her wartime trilogy "The Walls Do Not Fall," "Tribute to the Angels" and "The Flowering of the Rod." This work moves from the ruins of London to ancient Egypt (in part the poem was a reminiscence of a trip to Egypt in 1939); then it traces what may be called man's higher beliefs, from Osiris and Isis to Joseph and the Madonna. It is a poem of religious significance, not bound to time and place, but deriving from the atmosphere of horror and wreckage amid which it sprang, culminating in the extraordinarily lovely poetry describing the visit of the Magi, in its third section.

Wallace Stevens, approaching 70 and as reticent as ever concerning his personal life and the sources of his poetry, went on producing book after book which revealed that under the surface of his polished and urbane irony, there moved a deeply speculative mind, more and more concerned with the human motives governing man. One of his later books, "Parts of a World" (1942), dealing with the background of World War II, was on the whole his best. His detached point of view and subtle wit precluded his achieving wide popularity, but he remained one of the most markedly individual and intellectually rewarding poets of the era.

William Carlos Williams, born in 1883, crowned a long, hard-working career as poet and physician by producing the first book of a long, philosophic poem entitled *Paterson*, the climax of all his achievements. No one in the United States surpassed him in his integrity of utterance, or had a point of view more firm-rooted in the homely actuality and the real "American grain" of his poetry. Very few had his delicacy and sharpness of feeling concerning his own background. In *Paterson*, he symbolized an entire locality and discussed vividly the inhabitants' manifest inability to grasp or describe it; he summarized vividly his own development within its framework.

Marianne Moore (born 1887), whose influence as editor upon the poetry printed by the famous magazine *The Dial* (1920-29) had been so marked, published "What Are Years" in 1941 and "Nevertheless" in 1944, which definitely established her talent as one of the most important in America. Many readers were repelled, perhaps, by the ap-

parent artificiality of her form; but all could not fail to note her vivid eye for detail, the daring and resource she employed in the assembling of her poems. Deliberately intellectual and speculative rather than emotional, she produced during World War II her "In Distrust of Merits," that had great emotional impact. Her work seemed almost certain to outlast the time. Elizabeth Bishop, in her "North and South," largely modelled herself on Miss Moore, but had a sense of form more in conformity with poetic tradition. Her poetry, like Miss Moore's, was keen and witty—with occasional emotional overtones.

Poland

A republic in northeastern Europe, Poland is bounded by the U.S.S.R. in the E. and Germany in the W., the Baltic sea in the N. and Czechoslovakia in the S.

Area: Sept. 1, 1939 (including 349 sq.mi. for Cieszyn and 85 sq.mi. for Czadca, Orawa and Jaworzyna), 150,486 sq.mi.; Sept. 1, 1945 (after the Tripartite Berlin conference decision of Aug. 2, 1945, on the provisional Polish-German frontier, and the Moscow treaty of Aug. 16, 1945, fixing the new Polish-soviet frontier, but without Cieszyn, Czadca, Orawa and Jaworzyna), 119,703 sq.mi. In the east Poland lost 69,469 sq.mi.; in the west (if the new frontier were recognized by the peace conference) it stood to gain 39,120 sq.mi. Population: (1931 census) 31,927,733; (est. Sept. 1, 1939) 35,339,000; (Feb. 14, 1946 census) 23,911,172. Mother-tongue (1939 est.): Polish 24,388,000 (69%), Ukrainian and Ruthene 5,290,000 (15%), Yiddish and Hebrew 2,916,000 (8.2%), White-Ruthenian or Byelorussian 1,527,000 (4.3%), German 803,000 (2.3%), Russian 155,000 (0.4%), Czech 107,000 (0.3%), others 61,000 (0.2%). Religion (1939 est.): Roman Catholic 22,919,000 (64.9%), Greek Orthodox 4,253,000 (12%), Greek Catholic or Uniate 3,634,000 (10.3%), Jewish 3,351,000 (9.5%), Protestant 952,000 (2.7%), others 230,000 (0.6%).

The enormous shifting westward caused Poland a loss in population of c. 10,772,000 in the east including about 3,900,000 Poles; the recovered lands in the west—former German territories and the free city of Danzig—had in 1939 a population of c. 8,300,000 including about 1,000,000 Poles; the 1946 census disclosed there a population of 5,012,126, but a tremendous migratory movement went on afterward: 1,289,193 Germans left Poland from Feb. to Sept. 1946; c. 1,500,000 Poles coming from former Polish eastern provinces or from soviet deportation camps took their place; other Poles (986,578 up to July 31, 1946) were repatriated from Germany, Austria and western Europe; finally, up to July 1, 1946, 515,998 Ukrainians, Byelorussians and Lithuanians left Poland to settle in the respective soviet republics.

Chief towns (first figure est. Jan. 1, 1939; second figure

est. Sept. 1, 1946): Warsaw (cap., 1,289,000; 522,945); Lodz (672,000; 596,000); Cracow (259,000; 305,000); Poznan (272,000; 268,000); Katowice (134,000; 128,000); Lublin (122,000; 99,000); Gdynia (120,000; 79,000); two major cities—Lwow (Lviv) (318,000) and Wilno (Vilnius) (209,000)—no longer belonged to Poland, but among the cities recovered in the west were: Wroclaw (Breslau) (625,000; 168,000); Gdansk (Danzig) (235,000; 118,000) and Szczecin (Stettin) (272,000; 103,000).

Presidents of republic: Ignacy Mościcki, elected June 1, 1926, re-elected May 8, 1933, resigned at Kutu, on the Rumanian frontier, on Sept. 17, 1939. Wladyslaw Raczkiewicz assumed office in Paris on Sept. 30, 1939; after the French capitulation, he arrived in London on June 21, 1940; ceased his official functions on July 5, 1945, when the governments of Great Britain and the United States formally recognized the Russian-sponsored provisional government of Poland with Boleslaw Bierut as acting president of the republic.

Prime ministers: Gen. Felicjan Slawoj-Skladkowski (May 16, 1936–Sept. 17, 1939); Gen. Wladyslaw Sikorski (Sept. 30, 1939, until his death in an aircraft crash at Gibraltar on July 4, 1943); Wladyslaw Mikolajczyk (July 14, 1943–Nov. 24, 1944); Tomasz Arciszewski (Nov. 29, 1944–July 5, 1945). The Russian-sponsored government for Poland emerged first in Moscow, on March 1, 1943, as the Union of Polish Patriots; on June 22, 1944, in Chelm, a Polish Committee of National Liberation started its activity as a "provisional executive authority"; on Dec. 31, 1944, at Lublin, it transformed itself into a provisional government with Edward Osobka-Morawski as prime minister; on June 28, 1945, in Warsaw, this government was reconstructed by admitting five representatives of the Polish Peasant party headed by Stanislaw Mikolajczyk as deputy prime minister. (X.)

Struggle for Pilsudski's Mantle.—The last few years before World War II were taken up in Poland with the struggle for the succession to Marshal Jozef Pilsudski, who had virtually ruled the country from his *coup d'état* on May 12, 1926, until his death on May 12, 1935, but left no successor. The struggle for Pilsudski's heritage was fought out among the various factions of the late marshal's own followers. Protagonists in this contest were Ignacy Mościcki, president of the republic, Marshal Edward Smigly-Rydz, chief inspector of the army, and Col. Walery Slawek, chief of the so-called "colonels' group" and a personal friend of Pilsudski's.

In 1936 Rydz and Mościcki had arrived at an agreement, and on May 15 they formed a government under Gen. Felicjan Slawoj-Skladkowski which proclaimed Rydz "second citizen in the country" with precedence over the government. This act, which was contrary to the new constitution of 1935, established a kind of duumvirate. In an attempt to gain a hold on public opinion, a political bloc of government supporters was formed in Feb. 1937 with Col. Adam Koc as its chief. The bloc was called the National Unity Camp (O.Z.N. or *Oboz Zjednoczenia Narodowego*). On Feb. 20, Koc published a manifesto outlining the party's political and social program which, however, was devoid of any consistent political thought. All the other political parties maintained their opposition to the O.Z.N., and the peasants proclaimed in Aug. 1937 a ten-day protest strike, withholding supplies from the towns.

After a few months, at Mościcki's request, Koc was dismissed as chief of the O.Z.N. Public opinion and the

political parties, however, remained hostile to the new movement. The duumvirate, Mościcki-Rydz and the O.Z.N., also met with opposition from parliament and Slawek, its recently elected marshal (speaker). On Sept. 13, 1938, Mościcki unexpectedly dissolved the *Sejm* (parliament) and elections were held on Nov. 6 according to the new electoral law of 1935, which enabled the government to influence the *Sejm*. The political parties boycotted the elections, and 33% of the electorate refrained from voting; but with the help of the civil servants the government supporters won an overwhelming victory—the O.Z.N. had 161 of the 208 seats. The electoral law thus turned against Slawek, its author. Faced with political and personal disaster, Slawek committed suicide on April 12, 1939. Meanwhile political life in Poland was developing far from favourably. Anti-Semitic outbursts by young nationalist extremists, whom the government failed to keep in check, violence by army officers against the opponents of the regime and the establishment of an internment camp at Bereza Kartuska, where men were held without trial—all added to the unpopularity of the Pilsudski faction, which now could rely only on the support of the civil servants and army.

Opposition to the regime grew both on the left and on the right. The political parties differed in program but were brought together by their dislike of the regime. Foremost among them was the Polish Peasant party (P.S.L. or *Polskie Stronnictwo Ludowe*). Its great leader Wincenty Witos had since 1930 lived in exile, but he had left behind in Poland several able lieutenants, notably the former speaker of the *Sejm*, Maciej Rataj, Stanislaw Kot and Stanislaw Mikolajczyk, chairman of the Farmers' union in the Poznan province. The P.S.L., unquestionably the largest of the political parties, championed not only peasant interests but also free elections and the rights and liberties of all citizens. In foreign policy it advocated agreement with the western powers, particularly France. The Polish Socialist party (P.P.S. or *Polska Partja Socjalistyczna*), which had a strong patriotic flavour, closely co-operated with the P.S.L.; at one time it supported Pilsudski whom it had helped to power, but after the 1926 coup the Socialists went into opposition. To the right of the P.S.L. was the National party (S.N. or *Stronnictwo Narodowe*), founded by Roman Dmowski at the beginning of the century. Like the P.S.L., the National party favoured a *rapprochement* with France; indeed, during World War I it openly sided with the Allies.

In Oct. 1937, a new Christian Democratic party was formed; it was called Party of Work (S.P. or *Stronnictwo Pracy*). Its leaders were, first, Wojciech Korfanty and, later, Gen. Jozef Haller and Karol Popiel. Ignace Jan Paderewski, great artist and great patriot, and Gen. Wladyslaw Sikorski, author of military books warning against the German danger, who had been retired many years previously, joined hands with the opposition in criticizing the foreign policy of the government. The critics of the regime and government, however, exercised considerable restraint in view of the growing foreign menace to the country. It was only after World War II had started, when Poland was overrun by the Germans and the government and high command had moved abroad, that the Pilsudski regime collapsed, and the opposition parties assumed the reins of power at home and in exile.

German-Russian Vise.—Poland's foreign policy during the interwar years was an attempt at maintaining the balance between the two neighbours who might threaten

its independence. This policy, which might have been justified while both these powers were still militarily weak, continued unchanged but with diminishing success when each neighbour was far stronger than the young Polish state. Poland tried to strengthen its position *vis-à-vis* Germany and Russia by concluding an alliance with France (Feb. 19, 1921), by knitting closer ties with Rumania and the Baltic states and by giving full support to the League of Nations. Poland was indeed a valuable ally to the French at a time when Russia was only a weak countercheck to Germany, but it ceased to be an asset to France when both Russia and Germany had become powerful. Moreover, the French feared that they might become entangled in Polish-German disputes.

After his accession to power, Hitler indicated that he was prepared to reach an understanding with the Polish government. He made several approaches to Poland through different channels, but the first one was made before his accession to power through the intermediary of the high commissioner of the League of Nations in Danzig, Count Manfredi Gravina (an Italian). In these the question of Danzig and the so-called Corridor was dismissed as of secondary importance, and efforts were made to arouse Poland's interest in the east, especially in the Ukraine. At that time the Polish government saw clearly that it could no longer count on the support of the western powers, among whom pacifism and a policy of appeasement were making headway. On Jan. 26, 1934, a joint German-Polish declaration was signed. It eliminated the application of force in any dispute between the two countries for a period of ten years. In the five years following the signature of the pact the Germans reiterated their desire for friendly relations with Poland and carefully refrained from raising the question of the statute of Danzig and the Corridor, while dwelling on what they called the growing Russian menace. In this, however, they failed to gain Poland's ear.

Simultaneously, under the smoke screen of friendly talks and assurances, the reich government began to organize the German minority in Poland and liquidate Polish political rights in the free city of Danzig, and attempted to make Poland's foreign trade subservient to Germany's. Indeed, during 1936 and 1937, Germany managed virtually to abolish Polish rights and safeguards in the free city. Germany did this without changing its statute but merely by incorporating the political party organization in Danzig into that of the reich, placing the city under a gauleiter appointed by Hitler and by abolishing, with Poland's consent, the League of Nations guarantees, on which Polish rights in Danzig were based.

Polish-soviet relations were based on the peace treaty of March 18, 1921, which determined the Polish-soviet frontier, and on the nonaggression pact signed in Moscow on July 25, 1932, in which both countries undertook to refrain from the use of force to settle disputes for a period of three years. Poland, together with Russia's other neighbours, signed a convention for the definition of the aggressor in London on July 3, 1933. The duration of the Polish-soviet nonaggression pact was, on May 5, 1934, extended until Dec. 31, 1945. Although many clauses of the 1921 peace treaty, notably those on reparations, had not been fulfilled by the U.S.S.R., relations between the two countries remained peaceful.

The year 1937 and the first three-quarters of 1938 saw no fundamental change in Poland's relations with Germany or the soviet union. The nazification of Danzig was completed; but in his speeches of Sept. 26 and Oct. 9, 1938, Hitler acknowledged Poland's right to a sea

Polish Jews were prohibited from appearing without yellow triangles sewed on the backs of their coats as marks of identification during the German occupation

outlet and contrasted the Polish-German agreement with what he called the "worthless guarantee of the League of Nations." The Polish foreign minister, Col. Jozef Beck, in a circular of Nov. 9, 1937, told the Polish diplomatic missions abroad that he had no intention of joining the anticomintern bloc. The real aims of Beck's policy remained a subject of controversy, but many believed that he tried to maintain the balance between Germany and Russia for a while. Under pressure from Hitler, Beck made concessions, but to reassure Polish public opinion, which resented any concessions in favour of Germany, he sought to gain compensations from his policy of *rapprochement* with Germany.

During 1938 Germany's growing power cast a shadow across Polish policy. After the *anschluss* of Austria (March 12, 1938) Beck sent an ultimatum to Lithuania, demanding resumption of diplomatic relations. This was a countermeasure against the encirclement of Poland by the new frontiers of the greater German reich. After Hitler's diplomatic victory at Munich (Sept. 29, 1938), Poland occupied Cieszyn (Teschen) and several districts beyond the Olza. It had a strong claim to these territories on nationality grounds, but the method Beck employed to realize them by taking advantage of the tragic plight of the kindred Czech nation caused indignation among all sensible Poles and alienated public opinion in the west. Making use of Germany's powerful political and strategic position, Joachim von Ribbentrop in a talk with Ambassador Jozef Lipski put forward for the first time on Oct. 24, 1938, a demand for the incorporation of Danzig in Germany and for the construction of an extraterritorial motor road and railway line across Polish Pomorze to link East Prussia with the rest of the reich.

The German occupation of Bohemia and Moravia (March 15, 1939), the establishment of a Slovak protectorate (March 18) and the annexation of Memel (March 22) completed the encirclement of Poland. Germany renewed its demand for Danzig and the motor highway, but on March 27 it was again rejected by the Polish government. The German threat of aggression against Poland became more and more real; it was now clear that Beck's policy toward Germany had come to grief. In the house of commons, Neville Chamberlain, prime minister, declared on March 31, 1939, that if Poland's independence

were threatened the British government "would feel themselves bound at once to lend the Polish government all support in their power." A joint Anglo-Polish communiqué containing assurances of mutual help in the event of aggression against either country was issued on April 6, 1939. Poland's understanding with the west evoked violent reaction in Berlin. On April 28 Hitler denounced the Polish-German declaration of nonaggression of 1934 and the Anglo-German naval agreement. From that moment Polish-German diplomatic talks ceased and German acts of provocation in Danzig increased.

War and Partition of Poland.—On Aug. 24 a German-soviet non-aggression pact was signed in Moscow by Ribbentrop and Vyacheslav Molotov. The pact contained a secret protocol which assigned to the two signatories spheres of interest in Poland, the Baltic states and Rumania. Paragraph 2 of this document stated: "In the event of a territorial and political transformation of the territories belonging to the Polish state the spheres of interest of Germany and the U.S.S.R. will be delimited approximately by the Narew-Vistula-San line. The question whether, in the interest of both parties, the maintenance of an independent Polish state will be considered desirable, will be definitely decided only in the course of the further development of political events. In any case, both governments will solve this question by a friendly understanding."¹

War became inevitable. On Aug. 29, 1939, the German government put forward through Sir Neville Henderson, the British ambassador in Berlin, a demand in the nature of an ultimatum that a Polish plenipotentiary with wide powers should present himself in Berlin within 24 hours to hear and at once accept German terms. Poland learned of these terms from the German radio in the evening of Aug. 31. A few hours later, at dawn on Sept. 1, 1939, German armed forces without declaration of war attacked Polish territory. The preponderance of the forces which Germany was able to use against Poland on its eastern front was overwhelming (*see* WORLD WAR II). This campaign abounded in heroic attempts to halt the German invader. The last line of defense was planned to run around Warsaw and then through eastern and southeastern Poland. All plans were frustrated, however, on Sept. 17 when the soviet forces crossed into Poland at points along the whole Polish-soviet frontier between the Dvina in the north and

¹To the author's knowledge the authenticity of this document had been neither denied nor admitted by the soviet government up to the end of 1946.

Civilian Poles being led blindfolded to their execution by German military police, according to the photographer who smuggled the picture out of Poland in 1941

the Dniester in the south. On the following day the Polish government and the high command moved into Rumania; this ended the period of organized warfare.

On Sept. 28, 1939, Germany and the U.S.S.R. concluded in Moscow an agreement on the partition of Poland. Germany occupied 72,866 sq.mi., i.e., 48.4% of Polish territory, with a population of 22,100,000 people, while the U.S.S.R. occupied 77,620 sq.mi., on which 13,200,000 people lived. The Polish territories annexed by the U.S.S.R. were incorporated into the soviet republics of Ukraine, Byelorussia and Lithuania.

Poland under German Occupation.—Approximately half the territory occupied by the Germans, with a population of 10,600,000, was incorporated in the German reich. It formed the provinces *Westpreussen*, *Posen* (later renamed *Wartheland*) and *Schlesien*. The rest of German-held Poland became a *Generalgouvernement* with Cracow as the seat of a purely German administration headed by Hans Frank. In Poland the Germans found neither Quislings nor collaborators. Soon after the German attack on the U.S.S.R. the whole of Poland fell under German rule. A new district (eastern Galicia) was added to the *Generalgouvernement* while other Polish eastern provinces were divided as follows: Volhynia and Podolia became one of the *Generalbezirke* of the German-administered Ukraine; the Bialystok area was annexed to East Prussia; the Wilno area was allocated to the *Generalbezirk Litauen* and the Nowogrodek area to the *Generalbezirk Weissrussland*—both belonging to the reich commissariat *Ostland*.

The German occupation of Poland was marked by unparalleled and scientifically organized savagery hardly to be conceived by civilized people who did not witness it. Even the crimes revealed during the Nuernberg trial gave only a faint idea of what went on in Poland. It was estimated that more than 6,000,000 people, of whom almost half were Jews, were killed. The Germans had launched their total war to create a new living space for themselves. To this end a large section of the Polish people was to have been systematically exterminated, while the rest, deprived of its educated classes and national traditions, was to have been turned into a slave caste deprived of any voice of its own.

To oppose the powerful destructive machinery of the occupying forces, a well-organized underground movement was developed inside the country. Directly or indirectly the whole nation, men and women and even children, joined in. The movement took its directives from the Polish government-in-exile, which also approved major decisions and appointed local underground leaders. The fact that the headquarters of the resistance was outside the country safeguarded the movement against disorganization through discovery. Resistance to the Germans, terrorism and sabotage and the preparation of an administration to take over immediately after the war were the main objects of the movement in Poland. The underground army, numbering about 250,000, was organized in military fashion.

The Government and the Army in Exile.—While Poland was being overrun by German and Russian troops and the Polish government was interned in Rumania, a group of Polish political leaders formed a new government in France at the end of Sept. 1939. Headed by Gen. Wladyslaw Sikorski, it was composed mainly of representatives of the former opposition parties, i.e., the National, Christian-Democrat, Peasant and Socialist parties, with a few prominent men of no party. Pres. Ignacy Mościcki resigned in favour of Wladyslaw Racziewicz, previously *voyevode* (governor) of Polish Pomorze. This new government was first recognized by the French and British governments and later by other governments. It derived its authority from the constitution of 1935, which gave the president wide powers; but Racziewicz gave an undertaking to exercise some of them only after consultation with the prime minister. The new government obtained French and British loans to carry on. The main tasks of the government were to maintain the legal continuity of the Polish state, reorganize the armed forces, establish contact with the country and direct the underground movement, uphold Polish interests abroad and care for the many refugees dispersed throughout the world. A national council was called under Ignace Paderewski (from 1941 under Prof. Stanislaw Grab-ski) as a token parliament. The Polish government first established its headquarters in Paris and then at Angers in France.

A new army was formed from the remnants of the Polish forces crossing into Rumania and Hungary after the September campaign, from Poles who had previously settled in France and from the trickle of men escaping from Poland. This army in France reached a strength of 67,000 men. A large portion of the Polish navy and mercantile marine managed to slip through to the west. About 75% of the Polish airmen mobilized in Poland in Sept. 1939 found their way to France, where Edouard Daladier, the French prime minister, and General Sikorski signed a convention on Jan. 5, 1940, on the reorganization of the Polish army and air force. Two infantry divisions, a highland brigade and a motorized brigade were formed. The highland brigade commanded by Gen. Zygmunt Szysko-Bohusz

saw action in Norway, where it distinguished itself at Narvik. The 1st division under Gen. Bronislaw Duch and the 2nd division under Gen. Bronislaw Prugar-Ketling both fought on the Maginot line. Gen. Stanislaw Maczek with his motorized cavalry brigade fought at Epervan. The Polish air force shot down 69 German aircraft over France.

In June 1940 the French front collapsed and the French government moved to Bordeaux. The Polish government set up its headquarters in the neighbouring Libourne where, rejecting all suggestions of capitulation, it decided to continue the struggle by the side of the Allies. On June 18 the Polish president and government moved to England at the invitation of Winston Churchill.

In Britain the Polish army and government were reorganized for a second time after the blow sustained in the fall of France. The civil responsibilities of the government developed with their increasing responsibilities to their people in exile. Preparatory work was also done for the future peace conference, the postwar reconstruction of Poland and the ultimate resumption of its administration, and a scheme was debated for a federation of Central European states, to consist of Poland, Czechoslovakia, Greece and Yugoslavia. On Nov. 11, 1940, and on Jan. 19, 1942, a declaration and a preliminary protocol were signed by Poland and Czechoslovakia for this suggested federation.

The main effort of the Polish government-in-exile, however, was directed to the building up of a strong army. The forces evacuated from France were increased by men who escaped from Poland and by volunteers from North and South America; to these were later added the Polish troops evacuated from the soviet union and Poles who had been forcibly enlisted in the German army and captured and freed by the Allies. About 140,000 Poles were in the armed forces thus organized outside Poland. In Britain, Polish units were trained for the decisive fighting in western Europe in 1944 and 1945. The 1st armoured division, which was formed there under General Maczek fought at Falaise, Rouen, Abbeville and Saint-Omer in France; it captured Roulers and Thielt in Belgium and Terneuzen, Breda and Moerdijk in the Netherlands. On April 22, 1945, it entered Papenburg, its first town in German soil. Two weeks later it was in Wilhelmshaven. A Polish parachute brigade under Gen. Stanislaw Sosabowski took part in the action at Arnhem. The Carpathian brigade, formed before the fall of France and incorporated in Gen. Maxime Weygand's army in Syria, fought in another theatre of war. After the French capitulation it moved into British-held territory in the middle east and, led by Gen. Stanislaw Kopanski, took part in the North African campaign in 1941, distinguishing itself in the defence of Tobruk and in the fighting at Gazala and Bardia.

The troops withdrawn from the U.S.S.R. to Iran and Iraq and the Carpathian brigade were formed into the 2nd corps under the command of Gen. Wladyslaw Anders. In Feb. and March 1944 the 2nd corps was moved to Italy and incorporated in the British 8th army; it conquered the Monte Cassino height and monastery on May 18, 1944. During the pursuit of the German armies, the 2nd corps captured Ancona (July 18, 1944) and Bologna (April 21, 1945).

The Polish air force distinguished itself particularly in the battle of Britain between Aug. 8 and Oct. 31, 1940. Polish airmen in that period shot down 15% of all German aircraft brought down over Britain. Eight Polish fighter squadrons, operating from Great Britain from Aug. 1940 until May 8, 1945, shot down a total of 754 German

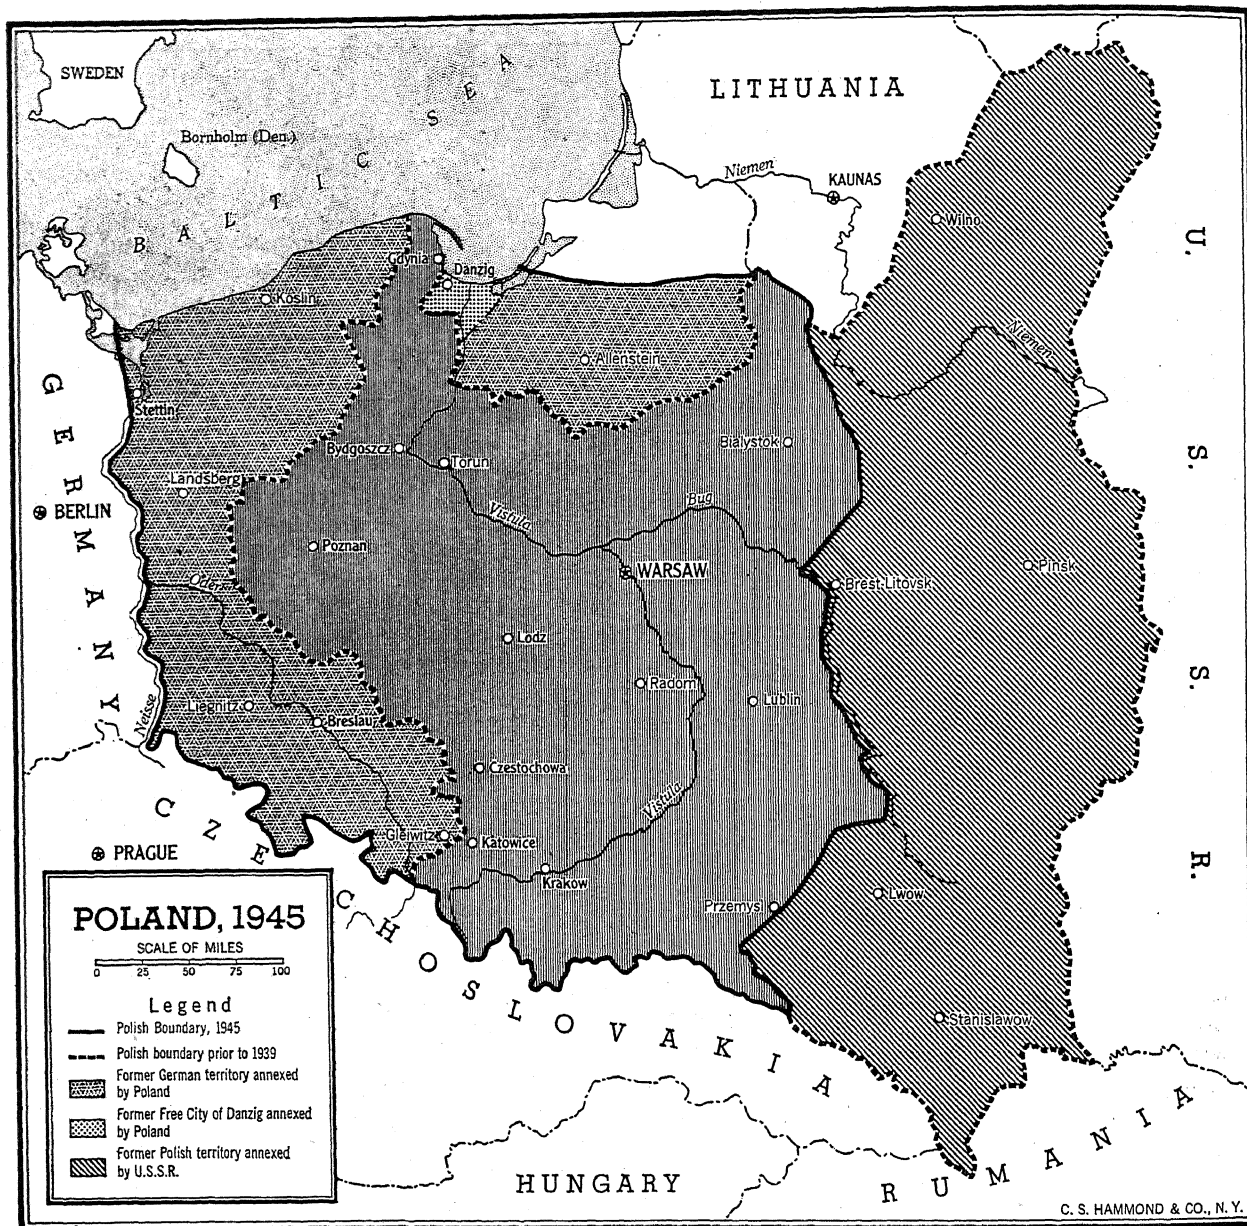

aircraft; top-scorer of the Polish fighter pilots was Maj. Stanislaw Skalski, with 19½ victories to his credit. Four bomber squadrons took part in 1,468 operations, making a total of 11,681 sorties; they dropped more than 32,082,000 lb. of bombs and mines. During this time, the Polish air force, under Air Vice-Marshal Mateusz Izycki, lost 1,968 officers, noncommissioned officers and men.

The Polish navy, under Vice-Adm. Jerzy Swirski, lost during World War II 1 cruiser, 4 destroyers, 2 submarines and 16 smaller craft with an aggregate tonnage of more than 30,000 tons. On V-E day, however, the Polish navy consisted of 1 cruiser, 6 destroyers, 2 submarines and a number of smaller craft. Among the operations in which the Polish navy took part were Narvik, Dunkirk, Tobruk, Dieppe, Normandy, Sicily, Salerno and countless patrols.

In the U.S.S.R., four infantry divisions, an armoured division and an artillery brigade were formed under soviet operational command. Polish units participated in the advance of the soviet forces in Byelorussia, the Ukraine and Poland and in the final operations against the Germans in 1945. Polish troops were responsible for the capture of Kolobrzeg (Kolberg) and Szczecin (Stettin) and entered Berlin with the soviet forces.

Poland and Russia: A New Phase.—A decisive change in the position of the Polish government took place on June 22, 1941, the day Hitler attacked the U.S.S.R. After somewhat arduous negotiations, agreement was signed in London, on July 30, by General Sikorski and Ivan Maisky, the soviet ambassador. The government of the U.S.S.R. recognized "the soviet-German treaties of 1939 as to territorial changes in Poland as having lost their validity"; diplomatic relations between the two governments were restored; the government of the U.S.S.R. expressed its consent to the formation on soviet territory of a Polish army; finally, the soviet government agreed to liberate "all Polish citizens now detained on the territory of the U.S.S.R. either as prisoners of war or on other sufficient grounds." On the day of the signature of the Polish-soviet agreement, Anthony Eden, British secretary of state for foreign affairs, handed the Polish government a note assuring them that "his majesty's government do not recognize any territorial changes which have been effected in Poland since August 1939." On Aug. 15, 1941, the Polish and soviet governments signed in Moscow a military convention providing for the formation of an autonomous Polish army, four to six divisions strong, under the command of General Anders. During the first six months, relations between the Polish and soviet governments developed satisfactorily, and on Dec. 4, 1941, General Sikorski signed with Generalissimo Stalin in Moscow a declaration stating that "in peacetime the relations between the two states will be based on the principles of good neighbourly collaboration, friendship, and the honest mutual observance of obligations agreed upon by both sides."

Soon afterward, however, serious differences and difficulties arose between Moscow and the Polish government over the nationality of the inhabitants of eastern Poland, incorporated into the U.S.S.R. after the soviet-German agreement of Sept. 28, 1939. There was also fundamental disagreement on the question of the Polish-soviet frontier. Other differences concerned the status of the Polish population in the U.S.S.R. and the organization of the Polish army there which ultimately was evacuated to the near east. This nullified one of the main clauses in the Polish-soviet agreement—that concerning joint military action. Shortly afterward Polish welfare officers who looked after

Poles in the U.S.S.R. were arrested, mainly on charges of espionage.

There was disagreement in particular over the lack of information about the fate of 10,000 Polish officers interned at Kozelsk, Starobelsk and Ostashkov. In order to counter German propaganda which charged the soviet authorities with the massacre of these officers at Katyn, the Polish government announced that it would ask the International Red Cross organization in Geneva, Switzerland, to investigate this matter. The soviet government reacted by breaking off diplomatic relations on April 25, 1943. A declaration by General Sikorski that the Polish people desired friendly relations and an alliance with the U.S.S.R. failed to change the situation, and the good offices of the Allies were in vain. Andrei Y. Vishinsky, the soviet vice-commissar for foreign affairs, declared that "the Polish government, influenced by pro-Hitler elements in its midst and outside and by the Polish press, has brought about the rupture in diplomatic relations." Meanwhile, as the soviet armies were advancing toward Poland, a union of Polish patriots was set up in Moscow in March 1943. Its organ, *Wolna Polska (Free Poland)* stressed the

need of Russian help for the Polish people and insisted that Poland must continue the struggle by the side of the Red army.

The Polish people suffered a tragic blow on July 4, 1943, when General Sikorski, who had personal charge of all military and civil affairs in Poland and abroad, was killed in an aircraft crash at Gibraltar as he was returning to England after a tour of inspection of the Polish forces in the middle east. He was succeeded by Stanislaw Mikolajczyk, the vice-premier. The controversies between the Polish government press in London and the soviet press, mainly on the frontier question, became more and more exacerbated in tone. The Polish government adhered to the frontier established by the Riga treaty, while the soviet government suggested the Curzon line, which was nearer to the Ribbentrop-Molotov line of 1939. The position of the Polish government, faced with soviet territorial demands, grew more and more tragic. It knew full well that it had to normalize its relations with the U.S.S.R., which, with its armies beating back the Germans, would exert a decisive influence on the outcome of the war and the future of Poland. Relations with the western Allies suf-

ferred because of the rupture with the U.S.S.R. Polish opinion, however, especially in exile, almost unanimously opposed the idea of territorial concessions, even if these were designed to spare the Polish nation greater sacrifices in the future. It seemed to a Polish government-in-exile that it had no mandate to accept a line that placed Wilno and Lwow outside Poland.

Poland's Fate Settled Without the Poles.—The meeting between Prime Minister Churchill, President Roosevelt and Generalissimo Stalin at Tehran in Nov. 1943 decisively shaped Poland's future. Churchill, reporting on the meeting in the house of commons on Feb. 22, 1944, recognized the legitimacy of the soviet claims to the "Curzon line" frontier. Stalin and Churchill also spoke and agreed upon the need for Poland to obtain "compensation at the expense of Germany both in the north and in the west."

The advancing soviet armies, driving the Germans before them, crossed the prewar Polish frontier on Jan. 3, 1944. Mikolajczyk, Polish prime minister, visited Washington on Jan. 5, 1944, as the guest of President Roosevelt. After the talks Mikolajczyk told a press conference that his government was willing to resume diplomatic relations with the U.S.S.R., adding that in his opinion as well as that of the United States government the question of frontiers should be settled after hostilities had ceased. On his return to London he saw Churchill and Anthony Eden, the British foreign secretary, and on July 27 went on to Moscow, accompanied by Stanislaw Grabski, president of the national council, and Tadeusz Romer, Polish foreign minister. While on the way to Moscow the party received the news that on July 22 the Union of Polish Patriots had been transformed into a committee of national liberation in Lublin as the supreme provisional authority in Poland. In fact, the delegates of this committee took part in the talks with the Polish prime minister in Moscow.

Meanwhile, one of the major tragedies in the history of the Polish nation was taking place in Poland. On Aug. 1, 1944, a rising started in Warsaw (*q.v.*), which was still in German hands. Mikolajczyk left it to Gen. Tadeusz Bor-Komorowski, commander in chief, home (underground) army in Poland, to decide when his forces were to strike. There was no response to the attempts of the Polish military leaders in Warsaw to establish contact with the soviet high command in order to agree on the timing of the rising. In these circumstances General Bor, in agreement with Jan Stanislaw Jankowski, the delegate in Warsaw of the Polish government in London, decided to give the signal. Warsaw held out for 63 days and the whole population fought with great heroism; the insurrection failed for lack of outside help. The rising cost at least 250,000 lives and the Polish capital was entirely destroyed.

The collapse of the Warsaw rising cast a shadow on the negotiations which Mikolajczyk was then conducting in Moscow. The Committee of National Liberation disapproved of the rising and blamed the Polish government for its failure. Mikolajczyk, while pleading for a free and independent Poland, was ready to make an alliance with the U.S.S.R. and receive Communists into his government and also to accept the Curzon line as a basis of negotiation, though insisting that Lwow should remain Polish. A communiqué issued at the end of the Moscow talks stated that the differences between the Polish government and the Lublin committee had been narrowed down and that talks were to be resumed. On his return to London, however, Mikolajczyk failed to find support in his cabinet on the Curzon line issue and resigned on Nov. 24, 1944. Tomasz Arciszewski, a veteran Socialist leader who arrived

in London from Warsaw in July 1944, and who did not approve of the talks with the soviet government, was then asked by President Raczkiewicz to form a new government, in which the Peasant party and Mikolajczyk declined to participate. The British government adopted a very reserved attitude to the new government. Meanwhile, the soviet army was advancing deeper into Poland. On Dec. 31, 1944, the Committee of National Liberation proclaimed itself a provisional government and was recognized as such by the soviet government.

Such was the situation when Churchill, Roosevelt and Stalin met again at Yalta in the Crimea early in 1945. The results of this conference were summed up in the official communiqué of Feb. 12 which said, in reference to Poland, that it should have a government formed on "a broader democratic basis with the inclusion of democratic leaders from Poland itself and from Poles abroad." It was to be called government of national unity. Vyacheslav Molotov (for the U.S.S.R.), W. Averell Harriman (for the U.S.) and Sir Archibald Clark Kerr (later Baron Inverchapel) (for the U.K.) were authorized to consult in Moscow with the various Polish political groups with a view to forming a Polish government which would later be recognized by the powers. The new government was pledged to hold free and unfettered elections as soon as possible. In these, all democratic and antinazi parties were entitled to participate and to nominate candidates. The leaders of the three powers declared that Poland's eastern frontier was to run along the Curzon line, with certain minor rectifications in favour of Poland, which was to receive new territories in the north and west.

Poland's future, eastern frontiers and provisional government were thus settled by the Big Three without the participation of the Poles. The method and results of this conference shocked the whole Polish nation. The vague wording of the Yalta decisions gave rise to disputes as to whether the proposed government of national unity was to be a continuation of the former Lublin government, merely broadened by the inclusion of new members, or whether it was to be a totally new government. Faced with the alternatives of leaving all power in Poland to the members of the provisional government or of himself joining that government, Mikolajczyk chose the latter course. On June 28, 1945, a provisional government of national unity was formed; it included representatives of the Polish Workers' (Communist) party, the split Socialist party, the Democratic party and the Polish Peasant party.

Between East and West.—In accordance with the Yalta declaration, the government was recognized on July 5, 1945, by Great Britain and the U.S. and then by all the governments having close relations with Poland, except the Vatican. Particularly close relations developed with the U.S.S.R., with which a number of outstanding questions were settled. As early as April 21, 1945, the provisional government concluded a 20-year treaty of friendship, mutual aid and co-operation with the U.S.S.R. The Polish-soviet frontier was fixed along the Curzon line on Aug. 16, 1945, in fulfilment of the Yalta decisions, with certain modifications in favour of Poland. Under a war reparations agreement signed on the same day, the U.S.S.R. renounced in favour of Poland its own claims to German property in territories incorporated in Poland; it also undertook to cede to Poland 15% of its indemnity from German property in soviet-occupied Germany and 15% of damages due to the U.S.S.R. from western Germany in return for supplies of Polish coal at a reduced price. A

With most of the buildings uninhabitable after the second battle of Warsaw in 1944, life in the Polish capital moved outdoors wherever possible

Polish-soviet agreement on an exchange of population was signed on July 7 and a commercial treaty on July 9, 1945.

Relations with Great Britain and the U.S. developed less favourably. The questions outstanding between Poland and Britain as a result of the joint conduct of the war remained unsolved. The greater part of the troops who had fought in the west and many civilians living in Britain did not return to Poland. No definite agreement was reached on the care of Poles in Britain, Polish war debts and the return of the gold deposited in Britain. Citing the Yalta declaration and Pres. Boleslaw Bierut's statement made in Potsdam at the end of July 1945, the British and U.S. governments insisted on the holding of free elections in Poland, reflecting the mood of the nation, a matter which aroused lively interest in the western countries. On the other hand, Polish opinion was grieved by the unreadiness of Britain and the United States to recognize the new western frontier of Poland agreed upon by the U.S.S.R. and Poland.

No progress was made in the internal political life of the country and over the consolidation of the government of national unity. Mikolajczyk's Peasant party and the remaining parties supporting the government clashed openly. On July 29, 1946, the Socialists and the Polish Workers' party decided to form an electoral bloc for the elections to be held on Jan. 19, 1947. Many members of the Peasant party were arrested or subjected to reprisals during the election campaign.

Although strained political relations with the western countries could not but react unfavourably on the eco-

nomie development of Poland, there was noticeable progress in certain fields. Five million people were settled in the newly acquired western provinces and provided with essential equipment. The reconstruction of ports, the need of which was increasingly felt, was promptly taken in hand. There was a rise in industrial production, particularly that of coal, which in 1946 reached more than 51,000,000 short tons. Internal needs were largely met out of United Nations Relief and Rehabilitation administration supplies, which in 1945 amounted to \$91,000,000 and in 1946 to \$470,000,000. A three-year economic plan to raise the general standard of living and increase the national income was put into operation.

Under the settlement, which in 1946 had yet to be confirmed by the peace treaty, the radical shift to the west of Poland's territory shook the very foundations of the Polish state. On the credit side could be counted a considerable reduction of national minorities, which had always been a source of trouble to Poland, widened access to the sea and, finally, a considerable increase in its productive capacity, both agricultural and industrial.

Police

The years 1937-46 witnessed what were probably the greatest changes in police organization and service ever experienced in any period of comparable length. Many of these changes were the direct result of converting police mechanisms to the special problems of war-torn states, and when armed conflict diminished or ceased there was necessary reconversion to more normal operating schedules.

In that process of hurried adaptation, most police agencies underwent political, structural or administrative changes which would influence their functioning for many years to come. Particularly striking was the outright disappearance of the secret political police of defeated Germany, Italy and Japan, while even among the victors the Russian N.K.V.D. was abandoned, only to be succeeded by an apparent counterpart under a new name. While such major shifts did not necessarily represent any permanent change in policies concerning secret political police, there could be no doubt that in the vanquished countries they would be resolutely suppressed by the occupying armies, with Allied military intelligence and Allied military police temporarily succeeding the outlawed agencies.

Protective police, on the other hand, not only survived World War II but most of them were the stronger for the forcing methods under which they had been compelled to develop during national emergencies. While there were many political changes among the protective police of axis countries and a marked tendency toward decentralizing their organization and control, these were mere temporary devices by which the victors sought to prevent development of civil police into a centralized military arm during the early stages of Allied occupation.

Centralization.—Even the western powers were conscious of the influences tending toward amalgamation of police agencies. In the U.S. these pressures were exerted in 1940 and 1941 during the period of impending war. Only limited objectives were sought, chiefly in the form of closer co-ordination of some tens of thousands of independent police units. In several of the states, legislation was enacted providing for free interchange of police personnel under conditions of extreme urgency. In many others similar arrangements were made on a wholly voluntary basis without the support or compulsion of statutory law.

In all cases, however, such departures were of prime importance since they represented abandonment of the administrative self-sufficiency characteristic of the operation and development of state and local police forces in the U.S. That common action among police departments was a continuing need, even though its urgency might not be a matter of daily experience, was demonstrated in connection with the devastating flood at Louisville, Ky., in 1937. Police officers from points more than 1,000 mi. away were dispatched to the scene—a stirring evidence of police co-operation, perhaps, but also a striking example of inadequate provision for aid from points nearer to the stricken area.

In England and Wales, impending invasion brought city, borough and county constabularies more and more under national control; and while this was formally abandoned once the imminent danger point was passed, it probably exercised a considerable influence in securing enactment of the Police act in 1946 (see below).

The effect of such integrating processes would inevitably be felt in other English-speaking countries, and their operation was accordingly watched with active interest, particularly in the U.S., which continued to support the most decentralized police system in the world.

Another war-produced factor tending toward change in police patterns was the maintenance of highly specialized public safety staffs by the military governments of the conquered lands. Such staffs, whether military, civilian or both, consisted in large measure of professional police administrators who were recruited in the several antiaxis countries. Their observation of the foreign police scene and their interchange of views with colleagues from other parts of the world promised to stimulate greatly the process of re-examining the police establishments of their homelands and the abandonment of many an outworn but traditional law enforcement method.

Depletion of Police Ranks.—World War II also produced a considerable though temporary realignment of police strength. For one thing, there was a substantial reduction in the number of police, caused wholly by the departure of young patrolmen for military service, and the difficulties experienced in recruiting temporary substitutes. In U.S. cities of more than 25,000 population, the decline from 1942 to 1945 was 8.2%, while some of the state police forces showed war-caused declines of as much as 35%. In Great Britain, the numerical strength of the London metropolitan police declined by 22% in the course of the war, and the situation in other belligerent countries was similar. Most of the variations in the amount of decline stemmed from varying policies in wartime recruitment. Some U.S. forces chose to maintain the full authorized strength even though it meant the permanent acquisition of substandard personnel—those with physical defects, unsatisfactory character references, low intelligence or over-age disqualifications. Others recruited temporary police who could not meet the regular standards and hoped that such police might be separated from the rolls at war's end. A very few forces took the position that personnel standards must be maintained in recruitment, even though this involved a marked decline in numerical strength.

The war years did not require so much law enforcement as more normal times. There was less crime in nearly all categories, while fuel rationing effected a marked reduction in the volume of highway traffic and consequently in the number of traffic accidents. While such alleviations of

the police task were partly offset by new duties arising out of war's emergencies, the net effect was to make it possible to maintain civil peace and security with a smaller police establishment. Actually there was as yet no reliable formula or index of the quotas of police required in any given situation, so it remained to be seen whether war's dislocations of police routine had stimulated application of new methods in determining police manpower requirements. If anything of that sort transpired, the police developments of the decade 1937-46 would acquire added significance.

Use of part-time auxiliary police naturally flourished during the war period, and many were the police administrators who rediscovered that improved public relations arose out of the use of such devices. Accordingly, there were numerous efforts to continue the wartime police auxiliaries as a permanent reserve. Whether these would succeed was far from certain, since experience in many parts of the world seemed to indicate that householders would volunteer for police duty when their hearths were threatened but with danger removed were unwilling to sacrifice their convenience as in the days of emergency. Hence, police reserves quickly became mere paper organizations when the stimulus of dangerous days was removed and would disappear altogether if effort were made to require actual performance of auxiliary police duty. The very clear prospect was that policing urban centres would continue to be a full-time task for regularly employed police personnel.

Wartime personnel shortages in many lands tended toward diversion of women police into traffic regulation and other uniformed services, but with the return of more normal conditions their reassignment to crime prevention activities and particularly to work with women and children seemed to be well under way.

Scientific Aids.—Wartime requirements greatly stimulated the use of motor equipment and police radio, and these gains promised to be permanent. Gains were most obvious in parts of the world where motorized and radio-equipped police were least common. In the U.S., the use of two-way radio communication from and to patrol cars became almost universal. Other communications developments included the progressive installation of frequency modulation transmitters and receivers, increasing use of so-called "three-way" radio (*i.e.*, including direct radio communication between patrolling cars), extension of intra- and interstate police teletype systems in the northeastern quarter of the country, and wide extension of the interstate and international radio telegraph facilities of states farther west.

Various tentative experiments with the police use of facsimile reproductions by electronics raised the distinct possibility that with the advancement of television techniques police might come to employ its facilities in certain specialized phases of criminal investigation.

Unions and Picketing.—In the U.S., two police problems slowly emerged and by the end of the decade had reached major proportions in some jurisdictions. The long-dormant issue of police unions was again to the fore in cities large and small. In some areas, courts or city counsels ruled out union organization among police. Other communities accepted them without question, while in most places the issue was either still uncertain at the end of the decade or had not yet been sharply raised. Some communities sought to avoid the chances of a collision between the public interest and that of a police union by

inserting a "no-strike" clause in union charters; but it was still highly doubtful whether any type of collective action by police employees could be reconciled with what appeared to be the basic disciplinary requirements of a quasi-military arm. It also remained to be seen whether or not the British device of representative committees for the various police ranks would continue to be accepted as a substitute for full union recognition. Throughout the world the employment status of the policeman was being re-examined, occasionally from novel angles. Whether there could be a reconciliation of public and private interests in this highly controversial field was also problematical, but the extreme likelihood was that the issue would not everywhere be peacefully resolved. Police strikes promised to bulk larger in the law enforcement news.

Another police problem of increased proportions also reached its most acute form in the U.S. It arose both from the use of mass picketing in connection with industrial strikes and from smoldering racial antagonism among Negroes and whites. Mass picketing produced tactical problems in the use of armed force with which few police establishments were well prepared to cope, while developments in Detroit and New York arising out of the 1943 race riots presented such disquieting features and aroused such anxieties for the future peace and good order of U.S. cities as to mark the period as an important point of departure for police in both their labour and their race relations.

U.S. War Problems.—War's emergencies also set the tempo for police developments in the U.S., though not of course to the same extent as in Britain. Since the time and the setting imposed fewer extraordinary burdens upon U.S. police systems, there were fewer major changes in police patterns. Indeed, for all of the temporary shifts of emphasis induced by the war years, these systems largely returned to their prewar patterns. Changes were chiefly in the form of extensions of services already well established; radio communication, crime reporting, criminal identification, police training and laboratory facilities all extended their sway in police circles so that there was scarcely a crossroads village force in which their influence had not been felt. Even the popularly elected county sheriffs who for generations had neglected their police functions, because of the risk of political unpopularity and a lack of stimulus from the prevailing fee system, now occasionally employed uniformed patrols, patrol cars, radio and teletype communication and various other superficial marks of the modern police force. Whether the sheriff's office, having lost its law enforcement powers in the land of its origin, could reverse the course of its 300 years of decline in the U.S., remained to be seen; but if the office should be partially restored as an active influence in law enforcement, the revival would date from the ten-year period 1937-46.

War's influence upon police administration was nowhere more pronounced than in the Federal Bureau of Investigation. A mere eight years before the Japanese attack at Pearl Harbor, FBI agents possessed no authority to carry weapons or to make arrests. These defects in their status were of course quickly corrected, and the bureau proceeded to grow apace both in size and in popular esteem. In 1941 it was entrusted with supervision over espionage and sabotage cases and succeeded so well that with the outbreak of war it was able to seize virtually all spies and saboteurs planted in the U.S. by the Nazi regime. Later efforts to insinuate new teams of Nazi agents into the country were quickly foiled by the FBI. State and local police made preliminary investigations in tens of thou-

sands of war-connected cases and turned the results of their labours over to the FBI for final federal action.

Other important developments at the FBI involved initiation or extension of various central services made available to police forces in general and without charge. Most prominent in this category was the training program of the National academy, which graduated over 1,000 police officers, many of superior rank, during the ten-year period. In addition, numerous training courses were provided on a regional basis to reach the rank and file of hundreds of police forces every year.

Also significant was the growth of nationwide and uniform crime reporting, conducted by the FBI with the endorsement of the International Association of Chiefs of Police and the active participation of more than 5,000 state and local agencies. While rural areas were not yet all covered by the crime-reporting system, more than 80% of the county sheriffs were submitting returns, while 96% of all cities and towns of more than 10,000 population were included in the reporting area. In 1945 Nevada was the only state in which every urban police force (more than 2,500 population) and every county sheriff was represented in the returns of offenses known to the police.

After 22 years of growth, the national identification files totalled around 100,000,000 fingerprint cards at the end of the decade, with more than 12,000 police agencies contributing to the national system. Criminal fingerprints coming into the central files exceeded 1,000,000 annually. Single fingerprint files for the more ready identification of criminals leaving only fragmentary latent prints at the scene of a crime were maintained for more than 15,000 outstanding gangsters, extortionists, kidnappers, bank robbers and check forgers. The FBI laboratory also had shown phenomenal growth, with more than 150,000 examinations being conducted annually at the request of federal, state and local police agencies.

Training developments at state universities and state colleges, at private institutions of higher learning, at the Traffic institute operated in conjunction with Northwestern university, Evanston, Ill., and by some of the leading state and municipal police forces represented a total effort toward the improvement of the police mechanism, both in general and in detail. Federal aid for police training, under the terms of the George-Deen act passed by the U.S. congress, relieved local police authorities of some portion of the cost of training but probably did not greatly affect the total amount of training provided. Where so many hands were extended in aid of so many kinds of training facilities, the progress of the facilities was assured regardless of any financial grants that might be offered by the federal government.

International police collaboration naturally increased during World War II, and among anti-axis countries this trend was easily measured by changes in the membership distribution of the International Association of Chiefs of Police. Prior to World War II, that association was almost exclusively composed of police representatives from the U.S. and the dominion of Canada. The war years added not only many members from Latin America but also an increased representation from western Europe. It was perhaps in recognition of these significant trends that the association held its 1946 annual meeting in Mexico City.

One of the last acts in the ten-year drama that came to a close in 1946 was the conclusion of the Nuernberg trials of war criminals. Notable as having a prominent place in the current history of police was the action of the International Military tribunal in declaring certain police groups of the nazi regime—the SD or security service and

Police Commissioner Lewis J. Valentine of New York city inspecting women traffic officers graduating from the training school in Tokyo, May 1946. This class was part of the new program set in motion during Valentine's reorganization of the Japanese police system

the gestapo—to be criminal organizations, thereby rendering former members subject to summary trial and punishment. Convicted and sentenced to death was Ernst Kaltenbrunner, head of the nazi secret police under Gestapo Chief Heinrich Himmler. He died on the gallows Oct. 16, 1946. (Br. S.)

Great Britain.—Before World War II the energies of the home office and the Scottish office, the local police authorities and chief constables were largely directed to improve

ments of organization and technique with the object of ensuring that the division of the British police service into local units would not prejudice efficiency. Centralized detective schools were instituted, detective methods were overhauled, a country-wide wireless system was planned and the home office undertook the task of providing in England and Wales a network of forensic science laboratories; these measures supplemented the arrangements which had been in existence for a number of years, under which the metropolitan police maintained central criminal records and, with other large forces, helped the smaller forces in cases of serious crime.

The total establishment of the police forces in Great Britain amounted to about 70,000. The metropolitan police had an establishment of about 20,000 and the separate police force of the City of London 1,100. In England and Wales there were 60 separate county police forces with an aggregate establishment of 21,600 and 121 separate borough forces with an aggregate establishment of 21,000. In Scotland there were 31 county and 18 burgh forces, with an aggregate establishment of about 7,000. In addition, there were in 1937 about 142,000 part-time special constables, men who voluntarily undertook to give unpaid police service in an emergency. From 1937 onward the police forces were increasingly preoccupied with plans for assisting the civil population to meet dangers from the air in time of war. Establishments were increased, training was given in air-raid precautions, antigas measures and so on, and the police took a prominent part in the general development of the civil defense organization. In 1939 steps were taken to enrol the Police War reserve and the Women's Auxiliary Police corps as auxiliary forces to be called up for duty in the event of war. On the outbreak of World War II these organizations were embodied; the peak figures of full-time auxiliaries amounted to 40,000 men and 3,500 women. The number of part-time special constables rose to 181,000.

War Experience.—World War II exacted new duties from the police service. A very considerable number of police guarded vital points and buildings which might be the objects of sabotage; the work of the criminal investigation departments of the various forces was very greatly increased and special branches of the C.I.D. (Criminal Investigation Department) were established in all forces to deal with wartime security matters. The defense regulations, made under the Emergency Powers (Defense) acts, placed a number of new responsibilities on the police; they were given special powers of arrest and search and were called on to assist numerous authorities. Among the more novel powers conferred were those of liberating pigeons and controlling or slaughtering animals out of control as the result of enemy attack. They had to enforce new penal measures such as the blackout regulations, and their ordinary duties of preventing and detecting crime had to be carried on during air raids and in the blackout.

The police continued to take a prominent part in the organization and development of the air-raids-precautions organization. In the later stages of the war, they assisted the British and Allied military formations in their dealings with the civil population and shared in the planning work preparatory to the mounting of the invasion of Europe; police liaison officers were attached to the principal British and U.S. formations, and took part in planning the complicated road movements of the invasion armies to their embarkation points. In a message of June 20, 1944, from supreme headquarters, Allied expeditionary force,

Gen. Dwight D. Eisenhower expressed his deep gratitude for the great assistance which the police forces had given him, his commanders and staff in all the various stages which had led up to the Allied landings.

War experience led to a striking extension of the duties of policewomen. On the outbreak of war there were only 278 regular policewomen in Great Britain. The wartime women auxiliaries were at the outset employed mainly on ancillary duties such as clerical and telephone work, but these duties were widely extended. The concentration in Great Britain of large British and Allied military formations produced problems which called for the services of women employed on police duties proper, in numbers out of all proportion to those available in the regular service. Women were also employed as members of the Criminal Investigation department and on motor patrol work. After the end of the war, measures were taken to recruit additional regular policewomen. By July 1946 the number had increased to 645, and the marriage bar was withdrawn in England and Wales.

In order to maintain the service at an adequate strength, measures were taken by parliament first to prohibit the retirement on pension of members of the police force who had served their full time and, later, generally to prohibit resignations from the police; provision was also made for conscription into the police if this should be necessary. On the other hand, the younger men in the police were not exempted from being drafted to the fighting services, and 18,000 regular policemen went into the armed forces. Recruitment for the regular police was suspended.

Postwar Developments.—As a result of the embargo on recruitment to the regular police service during World War II, and the withdrawal as from Jan. 1, 1946, of the ban on resignations from the police, all forces fell substantially below strength. A program of recruitment over a period of about two years was undertaken. This involved the recruitment and training of about 19,600 men as against a normal peacetime intake of about 3,300 men a year. Arrangements were made, with the agreement of the local police authorities and chief officers of police, for the allocation by the home office and the Scottish home department of quarterly recruitment quotas to all police forces, and for the training of recruits to be undertaken in England and Wales by the home office and not by individual police forces. The training capacity of the local forces thus set free was used for the purpose of giving refresher courses to policemen returned from the armed forces and those whose training had suffered because of wartime pressure. Nine training schools, with a capacity of 1,800 recruits, were established by the home office for the purpose of training recruits for the county and borough forces; in view of its size separate arrangements were made for the metropolitan police. In Scotland the training of recruits and the holding of refresher courses were being carried out at three local training schools pending the provision of a central school. Technical developments in the laboratories, the C.I.D. and wireless were taken up afresh.

Certain police forces in the south of England were amalgamated under wartime powers for the purpose of facilitating military operations. It had been recognized for many years that, in modern conditions, it would be of advantage to abolish some of the smaller separate units of administration and, accordingly, provision for permanent amalgamations of forces in England and Wales was included in the Police act, 1946. This measure provided for the absorption in the county police forces of the separate forces of all noncounty boroughs, with the exception of two such boroughs (Cambridge and Peterborough) where

the population of the borough was greater than that of the remainder of the county; it also provided better machinery for the voluntary amalgamation of county forces and county borough forces in suitable cases and made provision for the compulsory amalgamation of such forces in the absence of voluntary schemes. It was made clear during the passage of the bill that these proposals did not in any way derogate from the status of the police service as a local and locally administered service and that the government had no intention whatever of creating a national or a regional police force. Provision for the voluntary or compulsory amalgamation of police forces in Scotland was made in the Police (Scotland) act, 1946. Political Action Committee

The C.I.O. Political Action committee was founded by action of the executive board of the Congress of Industrial Organizations on July 7, 1943, and officially endorsed at the C.I.O.'s sixth constitutional convention in Nov. 1943. It was not the C.I.O.'s first participation in politics, as many of the C.I.O. unions had engaged in various political activities in 1936 on behalf of President Roosevelt.

In a report to the 1943 convention Pres. Philip Murray of the C.I.O. set forth as the reason for the C.I.O.'s formal entrance into politics "the organization of labor's political arm. While the Committee (P.A.C.) regards preparation for the crucial national elections of 1944 as a major task, it is also looking beyond 1944 and planning for a permanent political organization of labor."

The action taken grew out of the understanding by labour officials that whatever gains labour unions won through economic action were subject to enlargement, reform, or reversal in the political field. "The elementary legislative safeguards for the protection of the health and safety of workers, such as the workmen's compensation, maximum hours for women and minors, and safety and sanitary laws were all placed on the statute books through labor activity in the political area," the report stated. The growth of organized labour during the administration of President Roosevelt, when so much labour-supported social legislation was enacted, stimulated labour's awakening to its political prowess.

Any idea that the C.I.O.'s political action work was a forerunner to a new and third political party in the U.S. was scotched by the statement that "It is definitely not the policy of the C.I.O. to organize a third party, but rather to abstain from and discourage any move in that direction."

Sidney Hillman, president of the Amalgamated Clothing Workers union, was named first chairman of P.A.C. Other

members of the committee were Van A. Bittner, vice-president of the United Steelworkers of America, vice-chairman; R. J. Thomas, then president of the United Automobile Workers, treasurer; Sherman Dalrymple, then president of the United Rubber Workers; and David J. McDonald, secretary-treasurer of the United Steelworkers. Later Emil Rieve, president of the Textile Workers union, and John Green, head of the Industrial Union of Marine and Shipbuilding Workers, were added to the committee.

Before the P.A.C. initiated its activity, it conducted a searching analysis of the vote of both political parties in presidential and off-presidential election years. Its findings indicated that candidates considered unfriendly to labour, representing, it believed, the interests of only certain sections of U.S. industry, were elected in those years when only a small percentage of the people voted. Contrary to this, when a large vote turned out, candidates considered friendly to labour and regarded by labour as working in behalf of all groups in the U.S. were elected to office. Thus, the pivot of P.A.C.'s operation was getting U.S. voters to the polls in large numbers. It was the belief of the C.I.O. that only when the maximum number of people participated in free elections would U.S. democracy remain healthy.

To carry out this aim of a large vote, P.A.C. activity centred around three major phases. One was the registration of all eligible voters. The second was the transmitting of information and voting records and statements of officials elected by the people so that a clear picture of their records could be presented to the electorate before it entered the polling booths. The third was the effort of every registered voter to utilize his franchise on election day.

Beginning in the summer of 1943, Hillman and his associates held a series of conferences with trade union leaders in various parts of the country. The purpose of these meetings was to alert the international unions of the C.I.O. and the C.I.O.'s city and state industrial union councils for the job of building political action committees. A national office was established in New York city, and 14 regional offices were set up throughout the nation. During this organizational phase, the P.A.C. was not committed to any candidate or political party.

At a conference held in Washington, D.C., in June 1944 the P.A.C.'s program, called the People's Program for 1944, was adopted. Prior to this conclave, the P.A.C. sponsored a two-day full employment conference in January which was addressed by leading labour, farm, business and governmental leaders, and focused attention on the need for maintaining full peacetime employment.

Domestically, the P.A.C. program called for enactment of the Economic Bill of Rights proclaimed by President Roosevelt in his State of the Union message in Jan. 1944. Toward this end the establishment of a national planning board composed of representatives of industry, labour and agriculture, all working in co-operation with government, was urged. The program stressed immediate adoption of legislation ensuring full employment, a comprehensive plan of public workers, a nation-wide housing program, continuation of price guarantees to farmers and encouragement of the family-owned and operated farms, full opportunity for the development of small business with strict regulation of all monopolies, a veterans' program, improvement of the social security structure through passage of a national insurance health bill, increase of educational opportunities for all, the right of labour unions to

continue their functions unhampered, a federal fair employment practices committee to end discrimination in employment and abolition of the poll tax.

The foreign policy section of the program called for strengthening and preservation of the coalition of the United Nations "based upon deepening friendship and ever closer co-operation among the governments and the peoples of the United Nations"; destruction of the basis of militarism and fascist power in Germany and Japan; elimination of international poverty, unemployment and instability through long-term credits "free from political strings"; extension of the right of asylum and guarantees of adequate protection for persecuted minorities throughout the United Nations and support for the United Nations Relief and Rehabilitation administration.

In the presidential campaign of 1944 the C.I.O. Political Action committee endorsed the candidacy of Franklin D. Roosevelt for president and Harry S. Truman for vice-president. This was the only endorsement made by the national office. It was the policy of the P.A.C. that its local affiliates make all local endorsements.

Adhering to a nonpartisan course, the P.A.C. accorded endorsement to candidates within both major political parties. To critics who pointed out that more endorsements fell to the Democrats than to the Republicans, P.A.C. reiterated its policy of selecting candidates on the basis of whether or not the candidate's record indicated understanding and support for a program of genuine social advancements.

The national office of the P.A.C. was composed of the following divisions, all designed to execute its educational program: research, public relations, press relations, women's, youth, religious, racial and foreign minorities and speakers'.

Their function was to service P.A.C. field units with materials for stimulating political activity and to serve as advisers and organizers for local action. In all, during the 1944 presidential campaign, the P.A.C. distributed more than 85,000,000 pieces of campaign literature, including posters, leaflets, pamphlets, billboards, badges, press releases, besides numerous miscellaneous items. A special radio division produced transcriptions and scripts for local use. Special tours for P.A.C. speakers were arranged, and the usual multitude of political meetings were held. Articles were especially written for the labour, Negro and foreign-language press. One union—the United Automobile workers—produced an animated cartoon on the election which was seen by more than 4,000,000 people.

These materials were merely aids for local action. It was in the communities where P.A.C. proved most effective. It established a functioning political organization through ward and precinct clubs; its volunteer workers visited homes, places of work and recreational centres. It placed advertisements in the newspapers and distributed literature on street corners. All of this was done first to arouse the public to the need for registration, and even the most partisan sources credited the P.A.C. as being one of the determining factors in the record qualification of voters. The same process was repeated during the active electioneering. On election day the entire P.A.C. machinery was devoted to getting all voters to the polls. Special car pools took those who were sick or unable to walk and both men and women minded children while housewives exercised their right to vote.

Although P.A.C. did not state that it was the deciding factor which re-elected President Roosevelt in 1944, both

its supporters and opponents agreed that it was the hub around which much of the pro-Roosevelt sentiment congregated and that it did, through its publicity and educational techniques, arouse the political consciousness of large segments of the people.

The financing of P.A.C. conformed with the federal laws which dealt with the question of funds for political candidates and the conduct of political activities. An initial contribution of \$631,214 from the national C.I.O. and its affiliated unions financed such P.A.C. educational activities as discussion of national issues and the need for registration in 1944, prior to the conventions of both major political parties. Since the law required that no union treasury could make a contribution during general election campaigns (after the political conventions), individual contributions were solicited from the members of the C.I.O. unions to carry on P.A.C.'s work in behalf of candidates.

This was an entirely voluntary procedure, as attested by the fact that while the opposition charged P.A.C. was raising a \$6,000,000 campaign fund (supposedly \$1 from each C.I.O. member), voluntary contributions in 1944 up to November totalled only \$418,100.52. Of each dollar collected, half remained in the state and community where it was collected to finance local P.A.C. work while the remainder was sent to the national P.A.C. office. This same manner of financing P.A.C. activity was carried on in 1945 and 1946. In the 1946 congressional elections campaign, the same cries of "slush fund" were raised. National P.A.C. reported that \$141,565.94 was received from individual contributions.

P.A.C.'s activities, like those of all other political groups in the U.S., were fully examined by two committees of the congress. Both the U.S. senate Privileges and Elections committee and the house Committee on Campaign Expenditures gave it a clean bill of health. The U.S. attorney general, after two extensive examinations by the Federal Bureau of Investigation, reported P.A.C.'s conduct as entirely proper and within the law.

While the P.A.C. in 1944 recognized that its primary task was the mobilization of labour's political strength, it did not isolate itself from those nonlabour elements which it considered held common views and worked for the reelection of President Roosevelt. To carry out this policy it co-operated in the formation of the National Citizens Political Action committee.

Following the 1944 election a reorganization of P.A.C., designed to strengthen it in the local communities was approved by the C.I.O. executive board. Heretofore the main emphasis had been placed on political action committees within the local unions, and while this was to continue and be developed, the state, county and city industrial union councils of C.I.O. were to be drawn more actively into P.A.C. work. These councils were composed of delegates from various C.I.O. unions and formed the focal point for such C.I.O. activity. The responsibility for establishing P.A.C.s on a state, county and city basis rested with the councils, and plans were devised to broaden C.I.O. representation. The regional system was abolished, and stress was placed on state responsibility.

From the very beginning P.A.C. was instructed to mobilize labour sentiment on political matters in the local areas. This was not confined to candidates during election periods. While legislation was being debated during the 79th session of the congress, P.A.C. was instrumental in bringing to the people facts on these issues and informing the public what it might do to present its opinions on these issues. The importance of writing letters and telegrams to congressmen and senators, of sending delegations

from unions to Washington personally to visit and discuss these bills with the elected representatives of the people was continually stressed. The same process was repeated for state and community legislation.

Many of the measures of the 1944 program were again called for in the 1946 program. Of special concern to P.A.C. was the continuing rise in the cost of living, and it urged passage of price control legislation. It pledged itself to fight through political action those forces in both parties which were opposed to a program of genuine social advancement not only for labour alone but for all the people.

In the field of foreign affairs the 1946 program again renewed C.I.O.'s belief in the United Nations and scored attempts to split unity among the U.S., Great Britain and the soviet union.

While aiming at a large vote turnout in general elections, P.A.C. continually emphasized the importance of primary elections. In many localities, before a candidate received P.A.C. support both in the primary and general election, he was invited to attend a meeting of the committee where he could state his views on certain public issues. Sometimes a written questionnaire for the same purpose was distributed. Such replies were often printed in labour newspapers so that the union members could see for themselves what candidates believed.

The committee suffered a severe loss in Sidney Hillman's death on July 10, 1946. No new chairman was named. Instead a P.A.C. board was created consisting of David J. McDonald, Julius Emspak, William Pollock and George Addes, secretary-treasurers of the United Steelworkers, United Electrical Workers, Textile Workers and United Automobile Workers unions, respectively, and Jack Kroll of the Amalgamated Clothing Workers union. Kroll was named director. The Political Action committee was enlarged to contain all of the vice-presidents of the C.I.O.

During 1945 and through the 1946 congressional campaign, P.A.C.'s educational campaign continued, but the results of the 1946 campaign indicated that P.A.C. did not fare too well. Many of the candidates it supported lost. There was no halt in its activities, however. The eighth constitutional convention of the C.I.O. in Nov., 1946, gave it its full blessing and called upon it to work in conjunction with its progressive allies. The national headquarters were moved from New York to Washington, D.C. and a five-point program was announced, based on mobilizing support against antilabour legislation in the congress and state legislatures, presentation to the public of all the C.I.O.'s constructive proposals, the building of more active ward and precinct organizations and participation in local municipal elections in 1947.

Polo

Polo passed through three distinct periods during the decade 1937-46. In the first period, it was a flourishing

and growing sport in the United States, with more players and member clubs than ever before and about to take its place as a major sport on the U.S. scene. It was played throughout most of the world, with probably a more diverse following than any other sport—in such scattered places as Argentina, Austria, Australia, Brazil, Canada, China, Cuba, Great Britain, France, Germany, Hawaii, India, Eire, Italy, Mexico and the Philippine Islands. Even the U.S.S.R. was experimenting with the game as a possible training sport for cavalry officers. During these years, teams from Great Britain and Argentina visited the United States, and international polo was conducted at what is generally known as the American centre of the game, the Meadow Brook club on Long Island.

The second period opened with the entry of the United States into World War II at the end of 1941. National championships were called off and the game became absolutely dormant as most of the players went off to war and most of those remaining behind could not spare the time or effort to keep the sport alive. Some of the best players were killed in action, including the greatest player ever developed in the United States, Thomas Hitchcock, Jr. Others who never returned included G. M. Carnochan, Charles M. Armstrong, Jr., Col. D. T. Crow, W. S. Farish, Jr., George H. Mead, Jr., John Milburn and Charles S. von Stade. With the game at a virtual standstill for four years, critics predicted that it would never come back.

However, when the war finally ended, the United States Polo association, governing body of the game, was among the first of the sporting bodies to announce that its sport would be resumed and that all efforts would be exerted to put polo back on the sports map. The recovery, or third period, was rapid. Tournament polo was played on the Pacific coast during the early months of 1946, and indoor polo championships attracted large crowds to the Squadron A Armory in New York city at the same time. With the advent of spring in 1946, polo started again at clubs along the Atlantic coast and throughout the middle west. A Mexican team was invited to Meadow Brook for an international series in the fall of that year, and a picked U.S.

Mid-field action during the national open polo semi-finals between Texas and the Pelicans of Westbury, N.Y., at Westbury, in Sept. 1941. The Pelicans won by a score of 9-7

four defeated them in two straight games.

Polo, from its high of ten years before, through its standstill stage during the war, had started on the road back. The Polo association realized that there were difficult years ahead; some of the main problems were the high cost of the sport; the U.S. army's almost complete mechanization, which took away a large group of army players and government financial support; the lack of ponies and the lack of manpower to take care of playing fields and equipment.

WINNERS OF UNITED STATES POLO ASSOCIATION CHAMPIONSHIPS

National Open

- 1937 Old Westbury (M. G. Phipps, Cecil Smith, S. B. Iglehart, C. V. Whitney) 11; Greentree 6.
 1938 Old Westbury (M. G. Phipps, Cecil Smith, S. B. Iglehart, C. V. Whitney) 16; Greentree 7.
 1939 Bostwick Field (G. H. Bostwick, R. L. Gerry, Jr., E. T. Gerry, E. H. Tyrrell-Martin) 8; Greentree 7.
 1940 Aknusti (G. S. Smith, R. L. Gerry, Jr., E. T. Gerry, A. L. Corey, Jr.) 5; Great Neck 4.
 1941 Gulf Stream (J. H. A. Phipps, M. G. Phipps, C. S. von Stade, A. L. Corey, Jr.) 10; Aknusti, 6.
 1942-45 Inclusive—Not Played.
 1946 Mexico (Gabriel Gracida, Guillermo Gracida, Alejindro Gracida, Jose Gracida) 11; Los Amigos, 9.

Junior

- 1937 Santa Barbara (Harry East, Alex J. Bullock, E. H. Tyrrell-Martin, Charles H. Jackson, Jr.) 12; Narragansett 7.
 1938 Bostwick Field (E. H. Gerry, G. H. Bostwick, R. L. Gerry, Jr., C. S. von Stade) 8; Aknusti 5.

Twenty Goal (formerly Junior)

- 1939 League of Nations (J. K. Secor, Robert Skene, G. A. Oliver, Jr., Robert Loewenstein) 15; Hurricanes 9.
 1940 Great Neck (G. H. Dempsey, J. P. Grace, Jr., S. B. Iglehart, E. N. Carpenter) 12; Bostwick Field 7.
 1941 Bostwick Field (Sidney Culver, G. H. Bostwick, C. S. von Stade, A. L. Corey, Jr.) 9; Hurricanes 4.
 1942-46 Inclusive—Not Played.

Inter-Circuit

- 1937 Houston Huisache (R. D. Farish, S. P. Farish, William Dritt, Lt. A. H. Wilson, Jr. Sub: Vernon Cook) 10; Field Artillery School 5.
 1938 Field Artillery School (Capt. A. E. Solem, Capt. J. A. Smith, Jr., Lt. D. W. Sudduth, Lt. E. A. Walker) 9; Austin 8.
 1939 Houston Huisache (R. D. Farish, William Dritt, Harry Evinger, W. S. Farish, Jr.) 14; Oak Brook 4.
 1940 Blue Hill Farm (Walter Hayden, Peter Hayden, Hervey Swann, J. M. Romfh) 11; 7-11 Ranch 8.
 1941 Houston Huisache (R. D. Farish, William Dritt, R. S. Nichoalds, R. Humberson) 15; Ivory Rangers 7.
 1942-46 Inclusive—Not Played.

Twelve Goal

- 1937 Santa Barbara (Oliver Wallop, Hale Marsh, Ray Bell, Charles H. Jackson, Jr.) 7; Houston Huisache 6.
 1938 Not completed.
 1939 Pegasus (Del Carroll, C. C. Combs, Jr., C. R. Harrison, Hugo Anson) 12; Houston Huisache 8.
 1940 Gates Mills (J. Knutsen, Alfred House, Courtney Burton, John Hammond) 6; 7-11 Ranch 5.
 1941 Oak Brook (H. O. Owen, Jr., Paul Butler, Dan Peacock, Charles Aaberg) 7; Houston Huisache 6.
 1942-1946 Inclusive—Not Played.

WINNERS OF THE MONTY WATERBURY MEMORIAL CUP

- 1937 Old Westbury (M. G. Phipps, Cecil Smith, S. B. Iglehart, C. V. Whitney) 11; Greentree 10.
 1938 Aknusti (E. T. Gerry, R. L. Gerry, Jr., Capt. C. T. I. Roark, R. R. Guest) 11; Old Westbury 8.
 1939 Greentree (J. P. Grace, Jr., Robert Skene, Thomas Hitchcock, Jr., J. H. Whitney) 10; Texas 8.
 1940 Great Neck (G. H. Mead, Jr., J. P. Grace, Jr., S. B. Iglehart, R. E. Strawbridge, Jr.) 12; Aknusti 5.

- 1941 Gulf Stream (J. H. A. Phipps, M. G. Phipps, C. S. von Stade, A. L. Corey, Jr.) 8; Aknusti 7.
 1942-45 Inclusive—Not Played.
 1946 Miraflores (T. Zavaleta, F. Vogelius, E. Brown, O. Tri-cerri) 12; California 10.

INTERNATIONAL POLO

- 1939 Won by UNITED STATES (11-7, 9-4) at Meadow Brook. UNITED STATES: No. 1, Michael G. Phipps; No. 2, Thomas Hitchcock, Jr., No. 3, Stewart B. Iglehart; Back, Winston F. C. Guest. GREAT BRITAIN: No. 1, Robert Skene; No. 2, Aidan Roark; No. 3, Gerald Balding; Back, Eric H. Tyrrell-Martin.
 1942-46 Inclusive—Not Played.

Mexico vs. United States—1946

- 1946 Won by UNITED STATES (10-4; 11-4) No. 1, Michael G. Phipps; No. 2, Cecil Smith; No. 3, S. B. Iglehart; Back, Peter Perkins. MEXICO: No. 1, Gabriel Gracida; No. 2, Guillermo Gracida; No. 3, Alejindro Gracida; Back, Jose Gracida.

Poorten, Hein ter

Poorten (1887—), Netherlands army officer, was educated at the Breda Royal Military academy, and was commissioned a 2nd lieutenant in 1908. One of the first Netherlands officers to obtain a pilot's licence, he won an international prize for a flight in a balloon. He was made chief of staff of the Netherlands Indies army in 1937, and commander in chief of the N.E.I. army and head of the war department in Oct. 1941. After Japanese invasion forces landed on the island of Borneo in late Dec. 1941, Gen. ter Poorten called upon the Allies for more bombers, fighting planes and anti-aircraft to stem Japanese thrusts in Sarawak and Dutch Borneo. On March 2, 1942, he was given command of Allied armies in Java, but eight days later, the Japanese conquered Java and Poorten was captured and taken into custody by the Japanese.

Portal of Hungerford, 1st Viscount

Viscount Portal (Charles Frederick Algernon Portal) (1893—), royal air force officer, was born at Hungerford, Berkshire, England. He was educated at Eton and Christ college, Oxford. During World War I, he served with the British forces overseas, joining the royal air force in 1918. He was commander of British forces in Aden (1934-35), instructor at the Imperial Defense college (1936-37), director of organization at the air ministry (1937-38) and air member for personnel on the air council (1939-40). In March 1940 he was appointed commander-in-chief of the R.A.F. bombing command. In this capacity, he directed the R.A.F. attacks on nazi channel bases in France, Belgium and the Netherlands. Although he had only 190 bombers for the purpose, he succeeded in smashing German invasion barges moored at the channel

ports, thus forestalling a possible invasion of Britain. In Oct. 1940, he was made chief of the air staff and was promoted to marshal of the air force, Jan. 1, 1944. Lord Portal, who was created baron in 1945, retired as chief of the air staff on Jan. 1, 1946. On the latter date he was awarded the order of merit and was created Viscount Portal of Hungerford.

Porter, Paul Aldermandt

Porter (1904–), U.S. government official, was born Oct. 6, 1904, in Joplin, Mo. He was graduated from the University of Kentucky law school. In 1935, Secretary of Agriculture Wallace made him an executive assistant to the head of the Agricultural Adjustment administration. Two years later (1937), he left the AAA to become Washington counsel for the Columbia Broadcasting system, holding this post until 1942, when he was appointed deputy administrator in charge of rent control in the Office of Price administration. He resigned in June 1943 and the following month joined the War Food administration as associate administrator. Porter was public relations director for the Democratic national committee in 1944, and on Dec. 21, 1944, Roosevelt appointed him to the chairmanship of the Federal Communications commission.

On Feb. 14, 1946, Pres. Truman shifted Chester Bowles to head the re-established Office of Economic Stabilization and named Porter as Bowles's successor as director of OPA. Porter pledged himself to hold down prices until the "tide of inflation passed." He barred increases in price ceilings and appealed for support of the stabilization program. He resigned Nov. 29, 1946, after the OPA had been shorn of most of its powers.

Porto Rico

See PUERTO RICO.

Portugal

A republic in southwestern Europe, Portugal forms part of the Iberian peninsula and is bounded on the N. and E. by Spain and on the S. and W. by the Atlantic ocean. Area (including Azores and Madeira), 35,413 sq.mi. Pop. (census Dec. 1, 1940), 7,722,152; (official est. June 30, 1945), 8,132,942. Chief towns (census 1940): Lisbon (cap. 709,179), Oporto (262,309), Coimbra (35,437), Setúbal (37,071). Language: Portuguese; religion: predominantly Roman Catholic. President throughout the decade 1937–46 was General Antonio Oscar de Fragoso Carmona, provisional Nov. 29, 1926; elected March 25, 1928; re-elected Feb. 17, 1935, and Feb. 8, 1942. Prime minister: Dr. Antonio de Oliveira Salazar (named July 5, 1932).

The Strict Economy.—Despite the difficulties which beset the ten years from 1937 to 1946, and notwithstanding the almost complete stoppage of international trade and the greatly increased military expenditure arising from the world conflict, the task entered upon in 1926 was continued. The tradition of strictness in the country's finances was maintained through balanced budgets, the increase in the gold reserves of the Central bank and the creation of new taxes, particularly the war profits tax and the revised supertax. Development work continued both at home and in the colonies. Irrigation and hydraulic works in general, both agricultural and urban, underwent considerable expansion, the control of several rivers having been improved and the value of a number of important regions enhanced. The utilization of hydroelectric power constituted one of the foremost questions of the decade and was receiving the closest attention of the government, which was endeavouring to intensify the

Jewish refugees stranded in Lisbon in 1940. Thousands of émigrés driven from nazi countries crowded the Portuguese capital in that year, hoping to leave Europe with the aid of the Joint Distribution committee, a U.S. relief agency

work already begun on a large scale.

The mercantile marine was in full process of overhaul in spite of the arduous efforts required of it during the war: in addition to the new ships building abroad—the majority of them in Great Britain—a considerable number of smaller vessels were being built in Portugal. Aerial communications expanded greatly both in the mother country and in the colonies. This expansion was specially noteworthy in Angola and Mozambique, and lines were equipped with many new aircraft. Aerodromes were built in the Azores, Cape Verde, Portuguese Guinea, Angola and Mozambique. Lisbon, centre of international communications, was provided with a first-class airport at Sácarvem.

Improvements continued in the housing of public services of fundamental importance, such as education, telecommunications and transport. The reform of secondary education was published on Oct. 10, 1946, and those of university and technical educations were in the course of preparation.

The industrial problem was approached by the government with a view to improving output in the existing industries by the replacement of their equipment and to stimulating the growth of new industries of importance to the national economy. The fishing industry was greatly developed and also its sister industry, fish canning. The intensive reafforestation of the country was continued.

In the social field many collective contracts were signed fixing minimum salaries and holidays with pay. The housing of the population underwent noteworthy development, particularly as regards the building of dwellings for the poorer classes. There was a widening of the basis of assistance to workers in sickness and old age. New

holiday schemes were launched for the children of the poorer classes, and aid was given to private charitable institutions as well as to workers' syndicates providing cheap meals to wage earners or the destitute.

The civil procedure and penal codes were reformed. The penal system, both repressive and preventive, was improved. New prisons were built and several existing ones modernized. The armed forces were equipped with modern material and trained and prepared for the eventuality of war.

In the field of irrigation and water supply, the Corporative chamber in 1938 approved a \$44,800,000 irrigation scheme. By 1945, an area of 27,000 ac. had been improved and plans had been passed covering a further 142,000 ac. By 1942, a sum of 100,000,000 escudos had been spent on the regulation of rivers and canals. Since 1942 294 important works for the improvement of water supplies had been completed and 159 put in hand; the additional cost was 35,000,000 escudos.

In the execution of a vast plan for increasing the water supply to Lisbon and its suburbs a total of 139,000,000 escudos had been spent by 1942.

On Oct. 29, 1945, there were signed at Lisbon and Oporto respectively the articles constituting two companies: the Hidro-Elétrica do Zêzere and the Hidro-Elétrica do Cávado. In each one-third of the capital was held by the state. These two hydroelectric projects were expected to exercise a profound influence on the country's economy.

Approval was given on Aug. 10, 1945, to an extensive project for the expansion of the merchant navy and the replacement of old tonnage by new. It provided for the construction of 96 ships of c. 586,000 tons to be built up to 1950.

Following the reform of the post and telegraph services, it became possible in 1935 to launch a development scheme which in 1946 was still being carried out.

By 1946 nearly 3,000 dwellings for the poorest classes had been built in Lisbon and 1,376 in Oporto, and 5,000 more were to be built throughout the country in pursuance of a decree published in April 1945. Their cost was to be defrayed partly by the state and partly by the municipalities and charitable institutions. Lisbon municipality were levelling a site within the area under their control, on which were to be built dwellings capable of housing 50,000 middle-class people at low rentals. The municipality of Setúbal had under construction 220 houses for poor people, and a similar scheme was completed in Nov. 1945 at Faro, in the south.

Under a plan published in 1940, which took into account the probable increase in population during the subsequent ten years, 7,180 new school buildings comprising 12,500 class-rooms were under construction in 1946.

The year 1940 saw the creation by the state of the under-secretariat for social assistance. This department exercised superintendence over the civil hospitals, the *Misericórdias* (charitable institutions), the dispensaries, the homes and asylums, as also over the direction general of health and the direction general for public assistance. In 1944 the government published a law laying down the bases for the social assistance services, and another in 1945 creating the social aid fund.

The autonomous road board, which had been created in 1927 and re-organized in 1933, when it was provided with a ten years' fund of 1,000,000,000 escudos, had by 1942 built 1,739 mi. of new roads and repaired 5,673 mi. and

built 135 bridges and repaired 102. On July 13, 1946, a further extraordinary grant was made to the board. As the result of the improvements thus promoted, the number of motorcars on the roads had been trebled in the 15 years ending in 1946. There were then 47,469 motorcars; at the end of 1942 there were 800 motor coach services, covering 7,083 mi. of roads and carrying 22,000,000 passengers annually.

From 1934 to 1938, 45,872,852 escudos were spent on the reafforestation of mountainsides and dunes. In 1939 began the reafforestation of the region north of the Tagus at a cost to the state of 1,085,912,000 escudos.

Steps were also being taken to replenish the rivers with fish. During the 6 years to 1942, 1,172,500 specimens were supplied by the hatcheries.

The national broadcasting service was reorganized in 1940. It was equipped with two 50 kw. transmitters—one medium wave transmitting to the continent, and the other short wave transmitting to the colonies and overseas.

Foreign Policy.—In the field of international affairs, the policy of Portugal during the decade must be viewed against the background of the situation created by World War II. On defining its attitude at the outset of hostilities, Portugal conditioned its political position to the duties of the Anglo-Portuguese alliance. This sense of the importance of undertakings arising from a centuries-old alliance was one of the main considerations in the formulation of the policy followed by the Portuguese government during the war. It was in pursuance of that policy that, in Oct. 1943, Portugal, in compliance with a request put forward by Great Britain, authorized the establishment of British air and naval bases on the island of Terceira (Azores).

Similar facilities were granted to the United States of America on the island of Santa Maria.

In the far east, the occupation by the Japanese of the Portuguese colony of Timor was a blow which deeply wounded the Portuguese nation.

Macao, the ancient Portuguese colony facing Hong Kong, succeeded, not without heavy sacrifice, in avoiding the horrors of occupation. The colony became a refuge for many thousands of Europeans and Asiatics fleeing from the Japanese forces.

This sanctuary, however, was no more than the counterpart of the aid and succour given in continental Portugal to refugees from the war in Europe. In 1940 alone, the year of the German offensive in the west, Portugal gave shelter to almost 40,000 foreign nationals, many of whom were Jews.

Throughout the war Lisbon was the centre of aerial communications for the Atlantic, the base for many activities of the International Red Cross and the port from which sailed numerous ships carrying supplies to prisoners of war, and also the place chosen for the meeting of the control committee of the League of Nations.

In 1940 Portugal completed the 8th century of its existence as a nation and the third since the restoration of its independence. The centenary celebrations, which included the great "Exhibition of the Portuguese World," were attended by special envoys from almost all countries. (D. P.)

Salazar's Dictatorship.—The *Estado Novo* constitution, promulgated by decree on March 19, 1933, provided for an authoritarian political regime on a corporative basis. Formed in 1931, the national union was the sole political organization entitled to present a list of candidates in the four elections for the national assembly (1934, 1938, 1942 and 1945). In Oct. 1945, following Anglo-U.S. advice,

*1942. †1944. ‡1940. §1937. ||1943. ¶1939.

Salazar announced that "free elections" would be held on Nov. 18; he granted his people certain freedom of the press, of speech and of assembly. *Republica*, a daily newspaper with a total circulation of 15,000, accepted in good faith the government's change of heart and ran a series of editorials critical of the regime; within a few days its circulation in Lisbon alone rose to 100,000. The opposition was allowed to participate in the election under certain conditions: (1) a candidate had to declare his acceptance of the corporate state; (2) no one who had spent some

years outside Portugal could run for office. The opposition parties—Republican, Socialist and Communist—formed the M.U.D. (*Movimento de Unidã Democratica*) which asked that the voting be postponed for six months, and backed up their demand with mass meetings and demonstrations. The government refused any delay, and reintroduced the preventive censorship of the press; whereupon the M.U.D. issued a call for a boycott of the election. On polling day no more than 25% of the electorate voted. (See also PORTUGUESE COLONIAL EMPIRE.)

Portuguese Colonial Empire

The total area of the Portuguese colonial empire in 1946 was approximately 803,850 sq.mi.; total population (1940 census) 10,862,000 excluding metropolitan Portugal, the Azores and Madeira. Certain essential facts and figures relating to the colonial possessions of Portugal are given in Tables I and II.

Toward Reform.—In 1937 the Portuguese colonial empire was just emerging from the depression caused by the world economic crisis, although in the southern African colonies this revival was gravely hindered by a plague of locusts.

The difficulties arising from the slump and from other evils of longer standing compelled far-reaching financial reforms. Steps were taken to intensify the development of the various territories and the progress of colonization, to foster the well-being of the natives and to tighten the moral bonds between all parts of the Portuguese nation.

The first imperial economic conference met in 1937, attended by delegations from all the colonies for the purpose of discussing the problem, common to all, of their relations among themselves and with the mother country.

In 1938 a start was made with the economic organization of the main empire production (cotton, cereals, coffee) through the creation of boards with headquarters in Lisbon, on which were represented the producers and traders working in collaboration with experts and government officials. In that same year, General A. O. de Fragosa Carmona, president of the republic, accompanied by the minister for the colonies, Dr. Francisco Machado, paid an official visit to the colonies of São Tomé and of Angola, having inaugurated in the latter colony a great trade exhibition.

A five-year development fund had been created for Mozambique in Feb. 1937; in Aug. 1938, coinciding with the visit of the president, a similar fund was set up for Angola, to be spent by 1945. In 1939 the president visited the colonies of Cape Verde and Mozambique. During his tour he was the guest of the Union of South Africa, being the first foreign head of state to pay an official visit to that country.

War Problems.—World War II brought many troubles to the Portuguese colonies, with the loss of markets and their trade hindered by the shortage of shipping and by the introduction of the navicert system. Every effort was made, however, to increase production in order to supply Portugal with the goods it was unable to obtain from other sources, and also in order to help friendly nations. Imports of capital goods, motor cars and other goods became very scarce and costly.

The value of the colonial products exported, however, did not rise in proportion owing to the policy of price stabilization laid down by the government.

Portuguese Timor was occupied first by the Australians and Dutch, and later by Japanese forces (1942) who remained until 1945.

Although protesting energetically against Japanese acts of violence, Portugal had no other course but to remain neutral, as Japanese forces had also surrounded the Portuguese possession of Macao, in China, a small peninsula 5 sq.mi. in area, with the town of that name where a great number of British, American and Chinese nationals had found refuge, swelling the number of inhabitants to about 400,000 (thus making the density of population the highest in the world).

Clearly hostilities in Timor would have resulted in the loss of Macao with the perpetration by the Japanese of acts of violence against the population, and the Portuguese government, in agreement with the United Nations, found itself constrained to await the clarification of the military situation in south China or at least in the Pacific before taking part in the military operations for the liberation of its territories.

As a result of the difficulties created by World War II, the need arose for closer contact between the government in Lisbon and the colonies. Thus, in 1941 the then minister for the colonies, Dr. Machado, visited Cape Verde and Portuguese Guinea. In 1942 on the occasion of the termination of the Mozambique company's concession (granted in 1891 for the administration of the territories of Manica and Sofala, with the port of Beira, terminus of the Beira

Macao 5	340,000	Macao, colony, governor: Cmdr. Gabriel Maurício Teixeira
Timor 7,330	(est. 1938) 480,000	Dilly, colony, governor: Capt. Manuel de Abreu Ferreira de Carvalho

and the trans-Zambezi railways), he again visited Angola and Mozambique.

Important contingents of troops were sent at that time to garrison the Cape Verde Islands, Angola, Mozambique and Portuguese India.

By agreement with the United Nations, an expeditionary force was concentrated at Lourenço Marques for the purpose of taking part in the operations for liberating and occupying Timor. In view of the imminent Portuguese intervention in the Pacific war, the new minister for the colonies, Dr. Marcelo Caetano, visited Angola and Mozambique from June to Nov. 1945, and at the time of the Japanese collapse was in Lourenço Marques, where he was present at the departure of the troops for Timor.

Immediately on receiving notice of the surrender from the Japanese command, the governor of Timor (who had been kept a prisoner) enlisted the services of the Portuguese nationals left on the island—all of whom were as ill and weak as he—to restore the colony's administrative machinery.

In a few days the Portuguese administration was restored, without a shot having been fired, thanks to the

loyalty and devotion of the natives.

When the troops arrived, together with a mission of government officials, they found the island pacified and the Japanese on their way to detention camps in Australia.

During Caetano's stay in Lourenço Marques, the colony received the visit of Field Marshal Jan Christiaan Smuts (July 1945).

Shortly afterwards Caetano went to Pretoria to return the visit. At Beira the minister met the prime minister of Southern Rhodesia, Sir Godfrey Huggins, and important matters of mutual interest to the two territories were discussed.

Colonial Welfare.—The end of hostilities found the Portuguese colonies faced by grave difficulties in the matter of inland transport owing chiefly to shortage of rolling stock and tires. Although every effort had been made during the years 1939–45 to keep constructive activity in the African colonies at a high level, it did not always prove possible, owing to shortages of all kinds, to maintain the desired rhythm. Notwithstanding these difficulties, how-

ever, new aerodromes were constructed in Cape Verde, Guinea, Angola and Mozambique. In Angola, 14 light-houses (5 of them for both air and sea navigation) and 21 radio stations were set up; the port of Lobito (which had been completed in 1934) was provided with the necessary equipment, and the port of Luanda was built (completed in 1945). Improvements were also introduced in Angola's railway system and considerable work was done on the colony's vast network of roads (24,400 mi.). In Mozambique the new railways of the Limpopo valley, Tete and Nacala were built. The port of Lourenço Marques was enlarged, the length of its quays providing berths for shipping being 1.14 mi. in 1946, with a further 330 yd. under construction.

Numerous scientific missions were constantly at work in the various colonies. The year 1941 saw the creation of the Angola geographic mission (covering the geodesic network, astronomic observation and the preparation of a map of the colony to the scale of 1: 250,000); in 1936 the Angola hydrographic mission was set up to revise the hydrographic maps and charts of the coast; the Mozambique geographic mission, created in 1932, was expected to complete in 1947 the map of the colony to the scales of 1: 250,000 and 1: 500,000; the Mozambique mission, set up in 1929, nearly concluded the charting of the coast; in 1936 the Mozambique anthropological mission was created and in 1937

the Timor geographic mission, in 1942 the Mozambique botanical mission, in 1944 the Portuguese Guinea geo-hydrographic and zoological missions, in 1945 the Portuguese Guinea anthropological mission, etc. These missions were organized in Lisbon by the Colonial Investigations board and their cost was met partly by the mother country and partly by the colonies. Besides the scientific missions many others were organized to carry out economic surveys and public works of various kinds.

Special attention was paid to the problem of public health. In 1940 there were throughout the colonial empire 2,533 health officers, and the health budgets of the three main colonies (Guinea, Angola and Mozambique) totalled 50,000,000 escudos. By 1946 the number of health officers had risen to 3,744 and the health budgets of the 3 colonies mentioned had increased to a total of 97,500,000 escudos. In 1946 there were 369 qualified doctors and a 1,032 nursing staff employed in the health services of the Portuguese colonial empire. In addition, numerous doctors were employed by private concerns compelled by law to provide medical assistance to their native employees, and there were also doctors practising independently. Goa in Portuguese India had its own school of medicine and surgery and there were schools of nursing in all colonial capitals.

The work of these health services was directed toward the prevention and cure of disease. Special organizations

fought sleeping sickness in Angola, Mozambique and Guinea. In the latter colony the work was under the direction of the Institute of Tropical Medicine, which, for 50 years had been engaged on the treatment of trypanosomiasis, and was responsible for its total extinction in the island of Principe, having also originated the use of arsenic products in the treatment of the disease. In southern Angola, a permanent service for the surveillance and prophylaxis of bubonic plague was established.

Much attention was given in all the colonies to the fight against malaria. In the African colonies and in Timor strong measures were taken to combat filariasis, intestinal parasitosis and ulcers, all of which were widespread among the natives. The diet of the natives was generally defective and, in some regions, gave rise to vitamin deficiencies. The health services strove to improve conditions. Official tables of food values were set up, to be adhered to in the diet of those working for private employers. For their part, the agricultural services endeavoured to stimulate the growing of vegetables rich in vitamins. In Macao the government provided a special service for the cure of opium addicts. The opium trade was totally forbidden in the colony in 1945. There were no organized autonomous or separatist movements in the colonies during the decade. Political agitation in regard to Gôa was solely the work of a small minority of Gôanese in Bombay. The organic charter of the colonies, reformed by parliament, in 1946, enabled the colonial minister to increase local powers considerably in the light of the possibilities and of the degree of social development attained in each territory. By the

same measure natives were given representation on the various government councils. Education, health and well-being of the native peoples constituted the fundamental concern of the Portuguese government and inspired its laws and administrative measures. (J. M. R. D. S.)

Portuguese Literature

More was written and published in Portugal during the period 1937 to 1946 than ever before, although, as everywhere, quantity and quality did not always coincide. The Portuguese being a people of profound lyrical inspiration, the main intellectual activity was in the field of poetry. Thus, great poets like Affonso Lopes Vieira and Teixeira de Pascoas—both belonging to the *renovamento* ("renovating") and nationalistic movement in Portugal—maintained in their prose works all the lyric or symbolic essence of their previous poems. Poetry still provided the fulcrum for literary production, whatever the genre cultivated. In poetry, whether remaining faithful to tradition or seeking to create new forms, the following, among many others, deserved mention: Alberto de Serpa, Antonio Correia de Oliveira, Cabral do Nascimento, Carlos Queiroz, Fernanda de Castro, João de Castro Osório, José Régio, Natercia Freire, Pedro Homem de Mello, Vir-

610 ginia Vitorino.

In the field of philosophic thought, there were representatives of the various European systems of philosophy, while its most original and national expression was to be found in the study and continuation of the work of Leonardo Coimbra and Sampaio Bruno, as exemplified by thinkers such as Alvaro Ribeiro, Augusto Saraiva, Delfim Santos, José Marinho and Sant'Ana Dionísio. Catholic philosophy had its most distinguished representatives in Diamantino Martins, João Ameal, Ilídio de Sousa Ribeiro and in Cardinal Gonçalves Cerejeira. A notable feature of Portuguese philosophy lay in its criticism of intellectualistic thought, in the forms of Cartesianism, positivism or materialism.

Criticism in its various branches acquired a constructive character in contrast with the intellectual defeatism of the second half of the 19th century, and was seeking the paths of a renovation of Portuguese culture. To this much was contributed by a revision of cultural values and the reflective consideration of the highest principles of criticism.

In this connection should be mentioned the work of such writers as Castelo Branco Chaves, Diogo de Macedo, Fidelino de Figueiredo, Hernani Cidade, João Gaspar Simões, Joaquim de Carvalho, José Osório de Oliveira, Luiz Cabral de Moncada, Mario de Albuquerque, Rodrigues Lapa and Vieira de Almeida.

In the realm of fiction the best work was to be found in the continuation of the national romantic tradition, the most fertile examples being of a predominantly stylistic character since writers who had attempted the social novel did not seem to have found or assimilated its genuine characteristics. In the first rank were the names of Aquilino Ribeiro, Vitorino Nemésio and the Catholic novelist Francisco Costa. Colonial literature, continuing on a different plane the work of the voyagers of the 15th and 16th centuries, sought to throw light on Africa and on the soul of the Negro. In this genre the names of Castro Soromenho, Ferreira da Costa, Guilhermina de Azeredo and João de Lemos were prominent. In journalism, whether in the field of reporting or in that of commenting, the following were outstanding: Antonio Ferro, Augusto de Castro, Augusto Pinto, Artur Portela, José Augusto, Luiz Forjaz Trigueiros, Luiz Teixeira, Norberto de Araujo, Joaquim Manso, Correia Marques. While the theatre had not yet fully recovered the glorious tradition of Gil Vicente, D. Francisco Manuel de Mello or Almeida Garrett, the well-known dramatists Eduardo Schwalbach and Júlio Dantas continued to show that they were still at the height of their powers. (R. V. A. M.)

Post Office

In any evaluation of the work performed by the United States postal service for the decade 1937-46, the duties rendered by it for the period covering World War II must, of necessity, be given generous treatment.

As far back as 1938, systems were devised for co-operation between the post office and the war and navy departments for the handling of mail for the armed services in the event of war. When World War II did come, the post office department had ready well trained postal experts who were inducted into the armed forces to take charge of mail handling. How efficiently this stupendous task was performed against what seemed at the start to be insurmountable obstacles, was clearly proved by the official records.

The army postal service was in operation in 55 foreign countries, and it provided mail facilities for the military personnel through 800 army post offices outside the continental United States. Its overseas service during World War II sold more than \$1,500,000,000 worth of money orders, an average of approximately \$55,000,000 each month. More than \$100,000,000 worth of postage stamps and stamped envelopes were sold through overseas army post offices. More mail was dispatched overseas than in any period in U.S. history. From 22,000,000 pieces of mail in July 1942, the volume rose steadily to more than 266,000,000 pieces in March 1945: equivalent to more than 50 pieces of mail each month for each soldier overseas.

The army postal service took over the courier service in May 1942, which was designed to provide a speedy and safe means of delivering highly classified official matter. In June 1945, there were 7 international routes covering more than 92,000 mi., and 319 officer couriers were handling more than 2,000 lb. of material each month.

The postal service also operated the V-mail service. This system grew to a world-wide network of stations which, prior to discontinuance on Nov. 1, 1945, had microfilmed more than 1,250,000,000 letters. V-mail contributed to the war effort as it released valuable cargo space on planes and vessels and permitted the expeditious movement of regular mail. V-mail and air mail were carried to distant places in from 6 to 12 days. The service between the United States and China averaged 12 days; between the United States and India 10 days; to New Guinea 9 days; to Egypt 7 days.

U.S. Nonmilitary Developments.—The ten years 1937-46 marked an era in the post office department unmatched in any other similar period of its history. The postal revenues reached a peak in 1945 of \$1,314,000,000 and increased from \$726,000,000 in 1937 to \$1,224,000,000 in 1946. During the same period, the total amount of mail handled increased from 25,801,000,000 to 36,149,000,000 pieces. Letters and postal card. increased from 14,049,000,000 to 19,300,000,000. Newspaper mail increased from 4,500,000,000 pieces to 5,865,000,000. Circular and advertising matter increased from 5,355,000,000 to 6,220,000,000 pieces. The number of parcels increased from 684,000,000 to 949,000,000. While registered mail decreased from 114,719,000 pieces to 97,000,000, insured mail increased from 83,073,000 to 137,000,000 pieces. C.O.D. transactions increased from 33,358,000 to 52,000,000; there was an increase in special delivery transactions from 87,224,000 to 106,000,000. Money orders increased from 247,334,000 to 272,000,000, and the number of depositors in postal savings banks increased from 2,791,000 to 4,115,000; the amount to the credit of depositors increased from \$1,267,000,000 to \$3,110,000,000.

Loading first class mail onto a commercial plane at the Chicago airport during the railroad strike in 1946

Notwithstanding wartime impediments such as dislocated transportation systems, restricted equipment and supplies and the loss of nearly 60,000 experienced postal employees who joined the armed forces, regular postal service was continued to 140,000,000 citizens without embargoes on any class of mail and without serious delays. Vast migrations of workers necessitated the establishment of postal facilities in what had formerly been wildernesses. Wartime conditions brought about almost daily changes in transportation problems and mail distribution and delivery methods, but mails were handled with "certainty, security and celerity."

During these eventful ten years, a number of improvements were made in the postal service. A postal delivery zone system was placed in operation in 1942 at 124 of the larger post offices. Approximately 40% or more of the mail bore zone numbers. Postmasters reported that during Christmas periods, when the percentage of the zone mail was even greater, the system especially proved its practicability by enabling inexperienced substitute employees to perform distribution, resulting in prompt deliveries.

Highway post offices were established in 1941, large motor buses being built with all the equipment of a railway post office to provide postal service among cities and towns usually served by side line railroads that had been discontinued. The first route, established between Washington, D.C., and Harrisonburg, Va., proved so successful that additional routes were established the same year between Indianapolis and South Bend, Ind., and between San Francisco and Pacific Grove, Calif. These three routes were operated by the post office department itself.

The first highway post office to be operated by a contract carrier began service Sept. 9, 1946, between Union, Miss., and Mobile, Ala. The contract was awarded to the Gulf, Mobile and Ohio Railroad company, at \$30,000 annually. The company furnished the necessary equipment

and drivers and bore the cost of operation and maintenance; the route was 182.9 mi. in length, and the contract provided for one round trip daily except Sunday.

The postal note system was established Feb. 1, 1945, to supplement the money order service. Postal notes were limited to \$10 value, the fee being uniform at 5 cents. The service was developed particularly with a view to future improvements of the postal money order system by utilizing high-speed mechanical equipment, thus assuring greater accuracy and facility in the handling of the balance of individual items. During the first 5 months the postal note system was in operation in the fiscal year 1945, nearly 8,000,000 notes were issued; during the fiscal year 1946 more than 26,000,000 were issued.

During the years 1937 and 1942, the post office department had charge of moving by registered mail about \$22,000,000,000 worth of gold bullion to Fort Knox, Ky., from the assay office at New York city and the mint at Philadelphia, and to the mint at Denver from San Francisco. This vast undertaking was handled without the loss of a single dollar in value. One shipment of gold bullion from the New York assay office was started July 25, 1940, and was completed on Jan. 23, 1941. There were some \$9,055,884.651 of this shipment of precious metal transported between the two points. It weighed about 9,000 tons. The metal was shipped aboard 45 special trains, guarded by hordes of postal inspectors, secret service agents, police officials and army units. The registered mail cost about \$1,800,000.

In the year 1936 the post office department took over the problem of registering for the Social Security board more than 32,000,000 who were eligible for social security benefits, while in 1940 it handled the registration of aliens, and postmasters throughout the United States registered 4,889,770 noncitizens.

The work of the post office department's postal inspection service, generally referred to as the "eyes and ears" of the postmaster general, was outstanding during the decade. The transportation of 38,000,000,000 pieces of mail annually afforded many opportunities and temptations for committing depredations. When depredations, losses or irregularities occurred prompt and relentless efforts by inspectors were imperative to fix responsibility and take corrective action.

A ten-year investigation by postal inspectors concluded in May 1946, with the arrest of 71 persons operating an insurance swindle, was typical of frauds perpetrated through the mails. A group of unscrupulous lawyers, doctors and insurance agents conspired with policyholders in a scheme to submit total disability claims based on fake heart ailments. An estimated \$10,000,000 was filched from 32 prominent insurance companies.

It was conservatively estimated that, in the cases investigated by inspectors during the ten years, \$586,000,000 was filched from the public. As a result, there was an average of 4,341 arrests, 3,717 indictments and 3,699 convictions for each year of this period. During the 10 years postal inspectors handled a total of 1,314,469 assignments in connection with which a total of \$5,953,192 in money was recovered.

During the decade, great strides were made in the development of the air mail service, both in the United States and in other countries. While in 1937 U.S. foreign air mail service consisted of routes to Mexico, Central and South America and the West Indies, with one transpacific route, one from New York to Montreal and from Seattle to Vic-

toria, B.C., there was communication by air with practically every civilized country on the globe in 1946.

In the international service, the United States had direct contact by air with all of Central and South America, with Eire, England, Norway, Sweden, Denmark, the Netherlands, France, Portugal, Italy, Greece, Egypt, Saudi Arabia; Alaska, Hawaii, New Zealand—a total of about 211,000 route miles. All planes on these routes were American owned. In addition, the United States mails were being carried to some foreign lands by air lines not operated by the U.S. government.

In the U.S. domestic air mail field, establishment of new routes throughout the country and extensions of those in existence showed great progress in the ten-year period. While for the calendar year of 1937 there were but 13,396,060,117 air mail pound miles flown, in 1945 the number had jumped to 130,191,098,000. The air mail load per mile flown in 1937 was 319; by 1945 it had increased to 747 lb. The air mail pound miles per route mile performed on the domestic routes in 1937 were only 429,834, while this figure had increased to 2,170,600 miles by 1945. The total air mail pound miles performed in 1937 was 12,732,530,874, while for 1945 this had increased to 123,396,453,046. Route miles covered in the domestic field for the fiscal year 1937-38 numbered 33,655; in the fiscal year 1944-45, 56,849. The monthly average of passengers carried over U.S. domestic lines increased from 91,892 in 1937 to 625,211 in 1945. Total passenger miles flown rose from 476,603,165 in 1937 to 3,500,102,057 in 1945.

Exhaustive tests made by the post office department at Los Angeles, Calif., and Chicago, Ill., proved the practicability of the helicopter for carrying mail. Pickup was effected by the helicopter's slowing down and having a tilting device bring the mail sack into the aircraft. Deliveries likewise could be made without stopping.

The U.S. post office department was quick to conduct experiments with the flying post office and the flying mail car in order to speed up the domestic air mail service. The flying post office distributed and handled mail in the air.

The flying mail car was especially designed as an air post office and was equipped with all facilities for handling and assorting mail in flight. Normally, such work was done on the ground. One such car was operated from New York to San Francisco. The route taken on the historic flight was the same over which the post office department had pioneered coast-to-coast air mail service in 1930. Elapsed transcontinental time for letters, carried by planes in daylight and trains at night, was approximately three days; in 1946, coast to coast flights were made in approximately 12 hours.

Air mail postage rate of five cents an ounce between all United States territory and members of the armed forces abroad was in effect. The old rate was six cents a half ounce. A reduced domestic rate brought an unprecedented air mail volume. With members of the United States armed forces stationed in all parts of the world, the post office department, on Dec. 23, 1941, established a rate of six cents a half ounce for air mail to or from the armed forces. Such mail otherwise would have been subject to much higher foreign air mail rates. The new law treated all air mail destined to United States territory as domestic mail, and extended this principle to members of the United States armed forces regardless of where they were located. It also covered civilian personnel authorized to receive mail through army or navy post offices.

The post office department cited examples to illustrate

the effect of the new five cent U.S. flag rate. The old air mail postage between the United States mainland and the Canal Zone was 10 cents a half ounce; Canton Island, 25 cents; Guam, 35 cents; Hawaii, 15 cents. The old air mail rate between Puerto Rico and Guam was 43 cents a half ounce and between Guam and the Canal Zone, 45 cents a half ounce.

Great progress was also made by the railway mail service in the distribution and transportation of transit mails. During normal years, the volume of mail transported and distributed had increased tremendously, but during World War II mail for the armed forces overseas and in military camps taxed all available facilities and manpower to the limit. The inauguration of high-speed streamlined trains by railroad companies necessitated revision in the plans and specifications for railway post office cars, in order to meet changed operating conditions and improve working conditions within these cars.

There were no material changes in the conditions governing the acceptance of the low rates of postage of newspapers and other periodical publications admitted to the second-class mail privilege. On mailings outside the country of publication, a flat rate of postage of one and one-half cents a pound generally was applicable to the reading portion of such publications with a graduated zone rate of from one and one-half to seven cents a pound based on the advertising portion of such publications and the zone to which sent.

During World War II, co-operation was given the war and navy departments in efforts to get to the service personnel desired reading matter in newspapers and periodical publications admitted as second-class mail matter. Assistance also was rendered the department of justice in connection with seditious matter in the mails.

In 1937 the weight of mailings under the second-class mail privileges amounted to 1,335,224,538 lb., on which postage of \$22,525,429.55 was paid. For 1945 mailings weighed 1,379,374,594 lb., on which \$25,348,889.13 was paid.

Mail deliveries on the Luzon jungle trails in 1945 were made by U.S. troops, accompanied by armed guards and Filipino guerrillas

The United States Philatelic agency, established Dec. 1, 1921, reported total sales of \$15,870,004 for the period 1937-45. The number of orders handled for this period was 1,112,387, an average of \$14.26 an order. The turnover in actual stamps to obtain this figure amounted to approximately 950,000,000 specimens, by far the larger percentage of which was transferred to postmasters as being unsuitable for philatelic purposes.

The most phenomenal increase in the business of the agency was in the fiscal year ending June 30, 1946, when stamps to the value of \$3,030,692.36 were disposed of for collection purposes. During the period 1937-46, 160 new stamps were issued, divided as follows: commemoratives 115; regular 32; air mail 11, and special delivery 2.

Sweeping reductions in air mail rates to foreign countries became effective Nov. 1, 1945. These reductions, generally, were broken down into geographical areas to all parts of the world. As an example, rates to South America were reduced from 15 cents and 20 cents a half ounce to 10 cents a half ounce; Europe from 30 cents to 15 cents; and Africa, Asia and the far east from a maximum of 70 cents down to 25 cents. (L. Gc.)

Floherty, *Make Way for the Mail* (1939); *Official Postal Guide*; Post Office Dept., *Navy Mail Service* (1937); *Hearings and Reports of the House of Representatives, Committee on Post Office and Post Roads*.

Great Britain.—The business of the post office grew very rapidly during the years 1937-46, in spite of the fact that World War II necessitated a number of restrictions on its services and put a stop to plans of development. Major G. C. Tryon (later Lord Tryon) was the postmaster general in 1937, and his successors were W. S. Morrison (1940-43), Captain H. F. C. Crookshank (1943-45) and, from 1945, Lord Lisio well.

The total of transactions with the public was £3,157,945,000 in 1945-46 (year ended March 31) or more than 3 times the total of £961,948,000 for 1936-37; the sharpest rise was in 1940-41, when transactions amounted to £1,672,088,000 or more than 40% over 1939-40. Improved facilities offered by the post office and the general expansion of trade and industry probably accounted for the increase between 1937 and 1940, but the largest items contributing to it after 1940 were the growth of post office savings bank business, and of that conducted on behalf of other government departments, especially those concerned with the payment of war pensions and allowances. Excluding the value of these agency services, as well as wireless licence revenue, accounts from 1937 to 1946 showed an excess of income over expenditure, though there was a decline from a surplus of £12,306,769 in 1936-37 to one of £7,426,841 in 1939-40. Postal and telecommunication tariff increases and surcharges introduced after the budget of 1940-41 contributed substantially to the revenue, and in 1941-45 they yielded £142,800,000 out of surpluses totaling £158,550,000.

Table I.—British Post Office Transactions, 1936-46.
(Thousand £)

1936-37	961,948	1941-42	2,000,973
1937-38	1,026,064	1942-43	2,138,221
1938-39	1,062,177	1943-44	2,477,883
1939-40	1,184,500	1944-45	2,566,107
1940-41	1,672,088	1945-46	3,157,945

The volume of postal traffic in general grew steadily from 1937 to 1940, but during World War II the number of letters delivered fell, mainly because of a reduction in circular advertising and football pool traffic, while the volume of parcel traffic showed a sharp increase. Overseas

Table II.—British Postal Traffic, 1938-46
(In thousands)

	1938-39	1943-44	1944-45	1945-46
Letters and packets delivered	8,150,000	6,270,000	6,250,000	6,230,000
Parcels handled	184,832	235,301	284,010	257,331

mails were necessarily less expeditious during World War II and in some cases normal air mail services were suspended. Included in the 1940-41 budget surcharges was the advance in the inland letter rate from 1½d. to 2½d. and in the post card rate from 1d. to 2d. (May 1, 1940).

Between 1937 and 1939 the net increase in the total number of telephones was about 8% yearly, but saturation point was still a long way off when war difficulties reduced the rate of installation. Development was resumed in 1945, by which date there was a long waiting list, and by 1946 there were nearly 4,000,000 telephones in Great Britain as against 2,600,000 in 1936. They were being installed, in the face of a shortage of labour and materials, at the rate of 70,000 a month or twice the prewar rate. This development was part of a program involving an expenditure of £10,000,000 in 1945-46 and £17,000,000 in 1946-47. The increase in the number of calls, which was 6% per year in 1934, had risen to 9% per year by 1938, when there were 2,236,000,000 originated effective calls. World War II arrested this rate of development and by 1943-44 traffic had fallen to 2,151,000,000. By 1946 it was in excess of the prewar figure and it was estimated that there were 8,000,000 calls a day. The rate of increase in the number of long-distance inland calls dropped in the first two years of the war, but there was a marked increase after 1941, and in May 1943 a system of rationing was introduced by the restriction of trunk calls to six minutes. In 1943-44 trunk calls totalled 180,689,000 compared with 99,776,000 in 1936-37. During the year 1938-39 the total number of inland telegrams handled was 50,395,000, and for 1944-45 the number was 62,953,000, an increase of 25% over the prewar figure. On May 1, 1943, greetings telegrams, which formerly totalled 160,000 weekly, were abolished as an economy.

The number of operative broadcast receiving licences in force on March 31, 1937, was 8,127,635, which had increased by the corresponding date in 1946 to 10,395,551 (on Dec. 31 of the same years the numbers were 8,479,835 and 10,740,350 respectively).

Remittance business increased 45% between 1939 and 1945. While government restrictions on football pool traffic by post caused a drop in postal order business after 1940, business in money orders and postal drafts doubled during World War II.

Table III.—British Postal Remittance Business.

	1936-37	1938-39	1944-45
Money orders	£65,246,000	70,984,000	147,418,000
Postal orders	£88,898,000	103,960,000	83,102,000
Postal drafts	£23,062,000	26,489,000	61,320,000

An important factor in the financing of the war was the work of the National Savings committee and the organization for small savings of the post office played a considerable part in the movement. Savings in the form of savings bank deposits, and purchases of savings stamps, savings certificates and defense bonds swelled enormously the transactions of the post office department. Deposits, which had amounted to £130,265,000 in 1936-37, reached £428,388,000 in 1944-45 and £647,588,000 in 1945-46 including £189,000,000 release benefits to service personnel; the amount due to depositors at the end of 1936 was £432,371,000, a figure which had grown to £1,776,622,000 by Dec. 31, 1945. There was an increase of 9,700,000 in the

number of depositors' accounts between 1939 and 1945. Savings certificates issued in 1936-37 totalled £25,851,000, but purchases in 1943-44 amounted to £310,404,000, and in 1944-45 to £288,988,000 falling to £204,211,000 in 1945-46. Savings certificates remaining invested at March 31, 1946, amounted to £1,603,724,000, as against £390,094,000 on March 31, 1937.

These figures indicate significant changes in the distribution of capital in Great Britain.

Excluding savings, agency business done on behalf of the ministries of health, pensions and national insurance and the service ministries contributed most to the sharp increase in business in 1940-46. By 1945 the post office was paying out in service pensions and allowances nearly £8,000,000 weekly. In Aug. 1946 the post office assumed the additional function of paying out family allowances.

Table IV.—Issue of Pensions and Allowances
(Numbers of Transactions)

	1938-39	1943-44	1944-45
War pensions and billeting allowances	46,285,000	315,075,000	341,094,000
Pension orders paid (old age, widows', etc.)	188,103,000	290,021,000	300,189,000

During World War II all post office services were harnessed to national defense needs, and work of telecommunication installation was largely restricted to that required for the provision of services for civil defense and the armed forces of Great Britain and the United States; the work done for the latter contributed to reverse lend-lease arrangements. The post office provided telecommunication services for the home defense forces, with alternative routes and circuits, and became fully responsible for all civil defense communications, including the conveyance of air raid warnings. It organized its own air-raid precautions services and provided a contingent of the home guard for the defense of the telecommunication system in the event of invasion. The demand of these and other wartime exigencies, such as release of staff for the forces, the reduction of railway services, evacuation and population movements, the black-out, etc., threw an immense strain on its organization, and it was necessary to reduce postal collections and deliveries, place restrictions on trunk telephone services between 1943 and 1945 and in the interests of economy discontinue certain facilities. These difficulties were multiplied by the onset of aerial warfare in Sept. 1940. Much damage to post office property was sustained, but in spite of dislocations vital services were never interrupted. Their maintenance involved a great deal of immediate repair work and rapid adaptation to changing conditions. The most destructive raid to post office property took place on the night of Dec. 29-30, 1940, when the central telegraph office in London, through which more than a quarter of the telegraph traffic of the country passed, and the Wood street building, which housed three automatic telephone exchanges, were destroyed.

During the years of World War II many foreign telegraph and telephone services had perforce to be suspended. In spite of the destruction of equipment in the occupied countries, services with these countries were rapidly restored as they were liberated and the development of new types of services, suspended during the war, was resumed.

Radio telephone services were also resumed with most parts of the world.

In addition to the maintenance of home postal services the post office handled very large mails for the navy, army and air force as well as for prisoners of war. Mails for the

army and air force were dealt with at Nottingham, the main centre of the army post office (A.P.O.), and more than 1,000,000 parcels, 2,750,000 newspaper packets and 9,000,000 letters were dispatched from there weekly. Various concessions, including free postage for surface letters up to 2 oz. in weight, were allowed to members of the forces serving overseas. With the entry of Italy into World War II in 1940, the Mediterranean was closed to shipping and mails for the middle east, India, etc., had to go via the cape. To provide speedier postal communications an air-graph service was instituted in April 1941 between the United Kingdom and the middle east; it was later extended to Canada, East and South Africa, India, Australia and New Zealand, and by the time the service was withdrawn in July 1945 more than 330,000,000 airgraphs had been sent from or received in Great Britain. Another facility was the air post card, which was superseded in Dec. 1942 by the air letter, of which 3,000,000 weekly were being dispatched by 1945.

The post office was the largest single employer of labour in Great Britain, and in June 1946 the number of men and women in its service totalled 338,000. Its wage bill for 1945-46 was £77,900,000. About 80,000 members of the post office staff went on active service during World War II, of whom more than 4,000 were killed. More than 400 civilian workers lost their lives in post office service and many more were injured. Nearly 900 military and civil awards were conferred on post office workers up to the end of 1946. Trade unionism continued to play a growing part in the organization of post office staff. The two largest unions covering the service were the Union of Post Office Workers, which had a membership of 124,909 in 1939, increasing to more than 150,000 by 1946, and the Post Office Engineering union, the membership of which increased from 34,360 in 1939 to 45,663 in 1946.

The post office was responsible for the introduction of a number of technical improvements, the most notable being in connection with long-distance telephony. A special type of cable containing four separate coaxial pairs of conductors was completed between London and Birmingham in 1938—the first of its kind, it is believed, to operate commercially. These four coaxial pairs enabled the cable to carry 1,200 simultaneous conversations. A great advance in overseas telephony was made possible by the British-invented submarine repeater, an amplifying device capable of working on the sea bed without attention for at least five years, which doubled the number of circuits a cable could carry. The first of these repeaters was connected to the Belfast cable in 1943. In 1945 the telegraph cable-laying ship "Monarch," with a gross tonnage of 8,200 tons and capable of laying a cable across the Atlantic in one voyage, was launched. Also in 1945 the post office provided for the war department the longest submarine telephone cable in the world, that between Lowestoft and Borkum (northwest Germany). In 1946 this cable was equipped with a submerged repeater which increased the circuit capacity of the cable from 1 speech circuit and 16 telegraph circuits to 3 speech circuits and 36 telegraph circuits. (See also PHILATELY; PHOTOGRAPHY.) (W. F. H.)

Potash

French and German mines kept output of potash at high levels until the closing stages of World War II. The Polish fields and much of the German producing area then passed under Russian control.

Potash production in the United States made a new record high in 1945, for the 12th successive year, with a total more than three times the 1937 level. In spite of

the almost complete disappearance of imports, which furnished nearly two-thirds of the supply in 1937, domestic production kept pace with increasing consumption. During 1939-42, sales were in excess of production and stocks declined almost to the vanishing point, but they improved somewhat in 1943-45. (See also FERTILIZERS.) (G. A. Ro.)

Potato Beetle

See ENTOMOLOGY.

Potatoes

World production of potatoes was estimated by the United States department of agriculture at an average of 8,124,000,000 bu. for 1935-39, larger than the average for the preceding five years. After 1940, world statistics were incomplete and estimates were less reliable. In the prewar period 1935-39, the soviet union was first in production with about 2,000,000,000 bu., and Germany second with 1,040,000,000 bu. North America produced about 428,000,000 bu., South America 88,000,000 bu. and the rest was grown in many countries of Europe and Africa. Asia and Africa had never been important potato producers. The United Kingdom produced 182,600,000 bu., Canada 62,300,000 bu. and Ireland 98,288,000 bu. When the war began, Germany increased her crop to more than 2,592,000,000 bu. by 1942; the extent of the subsequent sharp decline in 1944-46 was unknown. Polish and soviet production also declined as the war devastation spread over these countries, but was reported as recovering rapidly in 1946. The output was adequate for the producers in most European countries, but surplus supplies for shipment to cities were very scarce. The losses of stored stocks and seed held in the bombed cities of Germany were felt by the city populations. The drought in the Mediterranean in 1944 reduced the crops of Italy and Spain. The Italian crop in 1945 was estimated at only 60% of the prewar average. Lack of fertilizer, work animals and seed were the principal causes of the decline in the crop. The output in Denmark, the Netherlands, Belgium and Switzerland was well maintained, but transportation facilities were lacking to move surpluses to other countries with crop deficits during most of the war period and after 1944.

United States.—The U.S. potato crop returned a total production of record proportions during the decade 1937-46 because of the higher yields harvested, although the acreage was below the prewar level. This was another example of the increased efficiency of farm methods aided

by a series of years of favourable weather. The 1943 crop of 464,999,000 bu. was an all-time high record. The previous record was made in 1928, when 427,249,000 bu. was harvested. The average for 1934-39 was only 375,091,000 bu.

During the decade 1937-46, crops were grown upon a smaller acreage than the average for the period between the two world wars. After 1900 the total area devoted to potato-growing had been close to 3,250,000 ac., the highest being in 1922, when 3,901,000 ac. were harvested. In 1937 the crop was grown on 3,185,000 ac., whereas in 1941, the area was only 2,711,000 ac. The yield increase was slow up to 1937, when it averaged 123.2 bu. per ac.—exceeded only once before, in 1924. The next increase in yield was in 1940, with 132.1 bu. per ac., followed by 1942, with 136.9 bu., 1943 with 139.6 bu. and the bumper record of 1945, with 150.6 bu. per ac. These rapid increases in yield were due to the use of more fertilizer and better seed varieties, and to generally improved cultural practices and shifts to the best soils. The latter change was stimulated during World War II by higher prices and labour shortage. The acreage was increased in the highest yielding states—those in the northeastern and northwestern areas, where summer temperatures are not too high and the water supply is ample. The lowest yields were grown in the dry plains and hot south. In ten of the best potato producing states acreage was increasing. Several areas had become outstanding in specializing in the potato crop. Kern county, California, increased acreage from 2,000 ac. in 1929 to 55,000 ac. in 1945; this one county produced more potatoes in one year, 1944, than did all potato states except the leading six. In the Klamath basin of Oregon and northern California, the increase was from 6,000 ac. in 1929 to 20,000 ac. in 1944.

The marketing of potatoes is a year-round operation since the early southern crop matures in winter or early spring and the harvest of the late crop is not finished until frost comes. Winter potatoes were grown in south Texas and Florida on an average of about 10,000 ac., yielding more than 1,000,000 bu. during the decade. The average price of this crop in 1933-42 was \$1.18 per bu., with a top of \$2.80 in 1944. The acreage of winter potatoes was greatly increased in 1946 to 15,300 ac., which brought a crop of more than 2,000,000 bu. The early spring crop, also from Florida and Texas, was grown on more than 28,000 ac., and the crop was about 3,000,000 bu. in 1943-46. The late spring crop was more widely distributed in 11 states from California eastward through the south. This

German-grown potatoes from Brunswick were brought into Berlin in 1945 by British army trucks, each carrying eight tons, to feed the city's inhabitants

crop covered about 205,000 ac. in 1943-46 and returned about 34,000,000 bu. The summer group of the early commercial potato crop, grown in nine states on the Atlantic seaboard and through Kentucky, Missouri, Kansas and Nebraska, averaged about 132,000 ac. and produced approximately 20,000,000 bu. in 1943-46. The intermediate and surplus late potato states produced the bulk of the larger crops of the decade. Production declined in the intermediate states, although prices rose higher than for the potatoes from the 30 late potato states producing the bulk of the surplus crop.

The prices of different crops of potatoes varied after 1937, but all increased after 1941 with the increasing war demand. Early potatoes advanced steadily until 1946, but the main crop declined after 1944. The season's average price of all potatoes at the farm rose from 52.9 cents per bu. in 1937 to \$1.49 per bu. in 1944, then declined to about \$1.35 per bu. in 1945-46. The wholesale price at New York advanced from 75 cents per bu. to \$1.95 in the same period. Futures trading in potatoes was begun in the Chicago Mercantile exchange in 1939, and was similar to futures trading in grains and cotton. A surplus of potatoes in 1940 led the government to buy 1,500,000 bu. for relief distribution and also made payments of 14½ cents per bu. for potatoes delivered to starch factories. In 1942, large quantities were diverted to livestock feeding and

almost 2,000,000 bu. were purchased by the government. The government called for an increased acreage in 1942 for starch, lend-lease and other domestic needs. Price supports were continued at 90% of parity by grades and regions, by purchases in the market, loans and by payments to producers. Prices of potatoes were above 100% of parity through most of 1945 and 1946.

Export shipments, formerly small, amounted to 2,097,000 bu. in 1945 and increased to about 14,000,000 bu. in 1946. Late potatoes were shipped to Canada, Belgium, France and United Kingdom. The U.S. consumer had almost a normal supply of potatoes throughout World War II, although large quantities were taken for the military forces and lend-lease. The prewar average consumption was 130 lb. per capita, 133 lb. in 1942 and 130 in 1945 and 1946. Military supplies in 1942 amounted to 26,900,000 bu.; in 1943, 29,900,000 bu. and in 1944, 33,700,000 bu.; they dropped sharply in 1945 and 1946. A large quantity was dehydrated for foreign shipment, amounting to 17,000,000 bu. in 1943 and 18,000,000 bu. in 1944.

Sweet Potatoes.—The sweet potato crop responded only slightly to the stimulus of World War II. This crop has increased in volume steadily but slowly from 1900, reaching high outputs in 1932 and 1935. The record crop of 1932 was 86,436,000 bu.; it was 83,128,000 bu. in 1935, after which year the average (1935-39) was 67,500,000 bu. Production declined from 1937 to 1942, then increased slightly in 1943, only to decline again to near the average of the decade in 1945. The big crop of 1932 was because of a record acreage of 1,056,000 ac. and a fair yield of 81.9 bu. per ac. Acreage was 840,000 ac. in 1937 and declined to

*Preliminary estimate.

709,000 ac. by 1945. The top yield of 100.9 bu. per ac. had not been equalled after 1915; that of 1945 was 94.3 bu. per ac. Prices of sweet potatoes rose through the decade from a farm average of 82 cents per bu. in 1937 to about \$2.50 in 1946. The price was supported under the Steagall act at 90% of parity for two years after the war's end.

Only a small part of the sweet potato crop was used by the military forces—about 1,000,000 bu. in 1943-44, and about the same amount in 1944 and 1945. Another 1,000,000 bu. were dehydrated, and almost an equal amount was canned during the same three years. Per capita civilian consumption averaged 23.3 lb. in 1935-39 and during 1940-46 continued at about 20 lb. per capita. The leading sweet potato state was Louisiana, which grew 17% of the crop in 1945. The competition of other food and oilseed crops was considered the chief cause of the lack of expansion in total production during World War II. (See also VEGETABLES.)

Poultry

World production of poultry was reduced by World War II, particularly in Europe. North America and Europe produced about three-fourths of the world's poultry and eggs before the war. The increase in Canada and the United States nearly offset the losses in Europe, so that the 1946 world total was estimated to be only about 5% below the prewar 1934-39 average. The largest decreases were in the Netherlands, Norway and Finland where production of eggs was reduced to only 25% of pre-war, while in the United Kingdom the output was down about one-third. The heavy exports of Canadian and U.S. dried eggs helped to hold the consumption in the United Kingdom to near 200 eggs per capita. Australia increased poultry production during the war, but in China and other eastern areas there was a decided decline. Food was so scarce in many areas that all eggs were eaten, thus preventing an increase in flocks.

Although the poultry industry in the United States had been remarkably stable for a half century, it made many important changes during the decade 1937-46. World War II accelerated these changes, which were just beginning in the prewar period. The highly specialized commercial broiler business, improved egg production per hen, housing and control of diseases were each important factors. The number of chickens on farms, where most are raised, had increased slowly during the four preceding decades,

ranging between 350,000,000 and 475,000,000 head. A high point of production was reached in 1928, after which year there was a decline until 1935. In 1938, a total of 389,600,000 head was reported on farms on Jan. 1, which number increased steadily to a record of 576,000,000 head in 1944. This high record was followed by slight declines to 510,000,000 in 1945 and 525,000,000 head in 1946.

Table I.—Number of Chickens on Farms in United States 1937-46
(on Jan. 1)

1937	423,921,000	1942	474,910,000
1938	389,624,000	1943	540,788,000
1939	418,591,000	1944	576,441,000
1940	438,288,000	1945	510,939,000
1941	422,909,000	1946	525,536,000

A more accurate measure of poultry production was the number of chickens raised, because the chicken crop is hatched and marketed within the year and is not subject to count on Jan. 1 of each year. In 1937, poultry was at a low point; only 601,000,000 were reported as raised, the smallest number in 20 years. This low production was followed by a steady increase to the top of 934,000,000 head in 1943 and 821,000,000 head in 1945. Commercial broiler production had just begun to expand in 1937, when 67,915,000 were grown. This crop increased rapidly to over 312,000,000 birds raised and sold in 1945. These birds averaged 2½ to 3 lb. each; their total weight was a considerable addition to the nation's meat supply.

The increase in broiler chicks was one of the most outstanding gains of the decade. This industry began about 1925 in the "Delmarva" area of Delaware, Maryland and Virginia on the eastern shore to meet the growing demand for chicken meat in the eastern city markets. The egg farms had produced broilers as a side line, but the new demand called for more broilers than the egg farms could afford to produce; therefore specialized broiler farms were developed. About half the production was grown in the South Atlantic states in concentrated poultry areas. For example, Sussex county, Delaware, produced more than 73,000,000 broilers in 1945.

Total U.S. poultry production, (chickens and turkeys) averaged 2,675,000,000 lb. in 1935-39 and rose to a high of 4,380,000,000 lb. in 1945. The total for ducks, geese and other fowl, not reported annually, was small. This total for poultry meat compared with 22,891,000,000 lb. of all meats from animals in 1945.

Table II.—Poultry Meat Production in United States, 1937-46
(In Pounds)

1937	2,042,009,000	1942	2,807,355,000
1938	2,185,049,000	1943	3,410,150,000
1939	2,337,980,000	1944	2,665,112,000
1940	2,092,831,000	1945	3,700,000,000
1941	2,477,222,000	1946	3,150,000,000

The commercial hatching industry likewise made significant changes during the decade 1937-46. In 1937, the output of the hatcheries was about 687,595,000 chicks, approximately the same number as the average of the previous ten years. In 1939, the big increase began, and by 1943 the total output was 1,609,121,000 chicks. During this period the price of chicks had risen from \$8.80 per 100 to \$13.90 per 100 in 1943. The output of the commercial hatcheries had greatly reduced the "setting hen" and the small farm incubator, and in 1940 it was estimated that commercial hatcheries supplied 70% of the chicks raised on farms. The development of the hatcheries made a fine market for the eggs from well-bred flocks. The quantity of eggs needed was large, since only about 68% of the eggs set produced chicks. The broiler business made the de-

Duckling hatchery at Riverhead, N.Y.

mand for chicks more constant throughout the length of the year. By 1946, 20% of the hatchery output was in the last six months of the year, compared to only 5% in the 1930s. The development of a method of "sexing" chicks, to determine the sex before selling them, also brought new practices into action. Egg farms bought only pullets, and the males were sold to broiler plants. The development of broiler-raising centres led to the beginning of allied industries dealing in feed, dressing for shipment and special breeding and hatching farms. The specialized trades became so recognized as to be organized into labour unions.

The great increase in the rate of egg production per hen, from an average of less than 130 per year in 1937 to about 150 per year in 1946, led to less meat output in relation to eggs produced. The purchase of pullets from sexed flocks by farmers lessened their output of surplus males. A part of the increased demand for meat was made up by the increase in turkeys, which furnish a much larger output of meat per bird.

The marketing of poultry products underwent important changes in the decade. The improvements in dressing and freezing poultry fully prepared for the consumer required the development of a new type of dressing plant, many of which were operated as co-operatives owned by producers. The poultry-feeding plants near large cities were disappearing. The quality of the poultry meat output increased steadily as government standards for grading and inspection were introduced by the extensive buying for military and lend-lease uses. Since the government prices and OPA ceilings were based upon grade, the use of grades became necessary.

Egg production on farms increased more than 50% during the decade 1937-46, from 37,564,000,000 in 1937 to 57,874,000,000 in 1944, the high record of the period. About a third of this increase was due to the rise in rate of output per laying hen mentioned above. The latter increase in turn was due to better breeding and feeding; many individual farms adopted the methods which

had enabled commercial farms to reach higher production years before. The National Poultry Improvement plan, inaugurated by the U.S. department of agriculture, was in operation in 1936-47 in 41 states with 30,558 flocks participating in supplying 1,239 hatcheries. High records of performance were made by 22,322 hens. By 1944-45, 73,578 flocks supplying 3,181 hatcheries were listed, and records of high performance on nearly 50,000 hens showed an average production of about 175 eggs per year. The United States register of merit in 1943-44 listed 2,873 hens with daughters which averaged 208 eggs per year. The production of eggs per capita for the United States as a whole rose from 319 in 1937 to 458 in 1944, then declined to 431 in 1945.

Another great change in the poultry industry during the decade was the expansion of the egg-drying method of marketing the products. In 1937, the total output was 2,291,000 lb.; in 1944 it was 320,742,000 lb. This form of processing was well adapted to military and lend-lease purposes because of the relatively small amount of space needed for shipment. For the military forces the only feasible means of shipping eggs to many distant points was in the dried form. This form provided a nutritious substitute for whole eggs from the shell for most uses. The dried egg did not prove popular with consumers, however, and probably would find its greatest use in the prepared mixtures of flour and other foods for home and institutional use. The advent of the dried egg made the public less dependent upon storage shell eggs in the low egg-producing season. Egg production had also become more constant throughout 12 months of the year.

The value of the poultry industry more than doubled during the decade. The gross income from chickens in 1937 was estimated at \$353,971,000 and in 1943, the high year, \$797,470,000. During this period the turkey industry made rapid growth, adding materially to the poultry total. The turkey income rose from \$66,933,000 in 1937 to \$204-

396,000 in 1944. Prices of chickens and eggs were fairly stable on the average from 1930 to 1940. Chickens ranged from a farm price of 10 to 16 cents per lb. In 1941, the upturn in prices came, and the average paid farmers in 1945 rose to nearly 26 cents per lb. Eggs rose at the same time from 21.3 cents per dozen in 1937 to 37.5 cents in 1945.

Extensive price support programs were used for eggs, but the principal federal government action affecting poultry was the series of restrictions placed upon the use of grains in 1945 and 1946 to divert the latter to relief needs. Chicken prices were supported at 90% of parity by government purchases of dressed chickens. Commercial poultry feed production was reduced about 20% in 1946 below 1945 with more effect on broiler and turkey production than on egg output. Prices of grains and concentrated feeds were raised in early 1946.

Turkeys.—The U.S. turkey-raising industry began to expand in the early 1930s but made its greatest growth from 1941 to 1946. Total production ranged from 303,000,000 to 406,000,000 lb. before 1937, when it was 375,787,000 lb. After the outbreak of World War II, the output moved up to 508,788,000 lb. in 1940 and then to 601,690,000 lb. in 1944. Turkey raising had become a highly specialized business, most of the birds being raised on farms in large flocks of 5,000 to 10,000 birds each. The farm price of turkeys rose from about 17 cents per lb. in 1937 to 33.9 cents in 1944. Gross income during the same period increased from \$66,933,000 in 1937 to \$204,396,000 in 1944. Civilian consumption of turkeys increased from an average of 2.6 lb. per capita in 1935-39 to 4.4 lb. in 1945. Large numbers were taken by the U.S. military services in the war years, but a large cold-storage stock accumulated in 1945. The tight feed situation was expected to reduce the 1946 output. A price support program was operated in 1946 to keep prices at 90% of parity. (See AGRICULTURAL RESEARCH ADMINISTRATION; EGGS; MEAT.) (J. C. Ms.)

Pound, Sir (Alfred) Dudley (Pickman Rogers)

Sir Dudley Pound (1877-1943), British first sea lord, was born Aug. 29, 1877, and was educated at Fonthill, East Grinstead, and at The Limes, Greenwich. He was in command of H.M.S. "Colossus" at the battle of Jutland May 31, 1916, and was mentioned in dispatches for his part in the engagement. From 1922 to 1925 he was director of the admiralty's plans division, and from 1925 to 1927 chief of staff to Admiral Sir Roger Keyes, then commander in chief of the Mediterranean fleet. He was assistant chief of the naval staff (1927-29) and served two years as rear admiral in command of a battle cruiser squadron (1929-31); in 1932 he was appointed second sea lord and chief of naval personnel at the admiralty. He was advanced to admiral in 1935 and the next year he was named commander in chief of the Mediterranean fleet. On May 17, 1939, he was appointed first sea lord and chief of the British naval staff to succeed Admiral Sir Roger Backhouse. During World War II, he attended the principal conferences between Prime Minister Churchill and President Roosevelt and participated in the United Nations staff talks. Shortly after his return from the first Quebec conference in the summer of 1943, he took ill and on Oct. 4 resigned his naval post. He died in London, Oct. 21, 1943.

Pownall, Sir Henry Royds

Sir Henry Pownall (1887-), British army officer, was born Nov. 19, 1887, in Blackheath, England. Educated at Rugby and the Woolwich Royal Military academy, he won the distinguished service order and the military cross for his service during World War I as an artillery officer. He became chief of the general staff of the British expeditionary force in 1940. Later, as inspector general of the home guard, he swiftly reorganized British home units in preparation for possible German invasion. Named temporary lieutenant general in 1940, he was vice-chief of the imperial general staff, May 1941. On Dec. 27 of that year, he was designated commander of British forces in the far east, with the task of checking the Japanese invasion of Malaya and of co-ordinating British military activity in the Pacific with that of its allies.

In Jan. 1942, he was made chief of staff to Gen. Archibald Wavell, then supreme commander of the Pacific area, and two months later was given command of British imperial forces in Ceylon. In March 1943, he was shifted to the middle east as commander of British forces in Iran and Iraq and in the following Oct. he was returned to the southeast Asia theatre as chief of staff to Adm. Lord Louis Mountbatten. Sir Henry's resignation from the latter post because of ill health was announced Nov. 27, 1944.

Pragmatism

See PHILOSOPHY.

Prague

On March 15, 1939, Adolf Hitler, preceded by German troops, entered Praha (Prague), capital of Czechoslovakia. The next day he announced that Czechoslovakia had ceased to exist and appointed Konstantin von Neurath as protector of Bohemia-Moravia. After President Emil Hácha had been forced to sign documents ending the country's independence, the protector closed the university and ordered all students and school children in Prague to turn out to watch a parade in his honour. Few attended as directed, and many turned their backs. In Sept. 1941, Reinhard Heydrich succeeded Neurath as protector, and a reign of terror began in the city, with mass killings. On June 4, 1942, Heydrich died from bullets fired by assassins near Prague, after which many Czech hostages were killed in retaliation by the Germans, and the village of Lidice was razed. In 1945, shortly after Hitler's disappearance, Grand Admiral Karl Doenitz, acting head of the reich, declared Prague a "hospital city" as the populace rose to threaten the German rulers while Allied planes, supporting the partisans, bombed the city. Even after fighting had ceased on all fronts, Prague continued to be held by the Germans. There Field Marshal Ferdinand von Schoerner declared he would not recognize the armistice. In the ensuing battles for control of Prague, German artillery pounded the city and suburbs as two Russian armies converged on the capital. On May 9, 1945, Russian troops entered the city, and firing ceased shortly thereafter. Practically no damage had been done in the city except for the town hall and two other historical buildings on the Old Town Square (Staroměstské náměstí). (See also CZECHOSLOVAKIA.)

620 Precious Stones

*See GEMS AND PRECIOUS STONES.***Pregnancy***See GYNAECOLOGY AND OBSTETRICS.***Presbyterian Church**

The Reformed Churches holding the Presbyterian system, within the United States of America, numbering 12, made some notable progress in various fields of Christian endeavour during the decade 1937-46. A positive advance was made in the union of a number of the denominations within the Presbyterian family.

Although progress in the movements toward unity had been made before 1937, two meetings that gave an impetus to a closer relationship among the Reformed Churches and influenced some of the general trends toward union in the United States were the Oxford conference and the Edinburgh conference which met during 1937. The Oxford conference on "Church, Community and State" was attended by about 800 delegates belonging to all Christian churches except that of Rome. The Edinburgh conference on "Faith and Order" had 414 delegates from 122 Christian communions in 43 countries. In its final report on "The Church's Unity in Life and Worship," the conference set forth three different levels of unity as (1) co-operative action, (2) intercommunion, (3) corporate union. To obtain corporate union it was recognized that unity in faith was essential for organic union. The supreme standard of the faith was "the revelation of God contained in the Holy Scriptures and summed up in Jesus Christ." A movement for a "World Council of Churches" to unite the interests of both of these conferences in a single representative body was instituted. In 1938, the Presbyterian and Reformed Churches officially approved the organization of the World Council of Churches as proposed in the provisional conference held in Utrecht, the Netherlands.

In the United States in 1934, a movement in the direction of organic union between the Reformed Church in the United States and the Evangelical Synod of North America had been initiated. The first meeting of the general synod of "The Evangelical and Reformed Church," the name adopted for the united church, was held in June 1934. In 1938, the organic union was consummated, and in 1940 the new constitution was put into operation. The new church consisted of 34 synods, 2,478 ministers, 2,873 congregations with a total communicant membership of more than 650,000 and a Sunday school enrolment of almost 600,000.

During the decade 1937-46, the two branches of the Presbyterian Church which arose out of the conflict between the states in 1861-65 made definite progress in the direction of reunion. In 1941, the general assembly of the Presbyterian Church in the United States of America (Northern) directed its three boards of foreign missions, national missions and Christian education to appoint committees to confer with similar committees of the Presbyterian Church in the United States (Southern) on means to co-ordinate all the missionary and educational work of the two churches in the hope that "such a procedure would lead to a form of organic union which would be acceptable to both." By the interchange of fraternal delegates and the continued negotiations of the committees on co-operation and union, the two bodies forwarded the movement to such an extent that in 1946 a revised plan of reunion had been prepared for referral to the general

assemblies of both churches.

Both the northern and southern Presbyterian Churches through their committees maintained in the meantime relations with a view to union with the United Presbyterian Church. In 1946, a joint committee of the Reformed Church in America and of the United Presbyterian Church drafted a plan of union to be sent to the judicatories and ministers of both churches for their joint study and suggestions. The Evangelical and Reformed Church, after several years of negotiation with the Congregational Christian Church, adopted a basis of union to be submitted to the synods.

In 1938, the Protestant Episcopal Church presented an invitation to the general assembly of the Presbyterian Church in the United States of America "to achieve organic union between their respective churches." The Episcopal Church through its Commission on Approaches to Unity and the Presbyterian Church through its Department of Church Co-operation and Union prepared articles for a basis of union. The general assembly awaited the action of the convention of the Episcopal Church before acting on the basis of union. The recommendation of the commission to the Episcopal general convention in Sept. 1946 on this proposed basis of union was rejected by the convention, which then voted to continue negotiations toward a closer fellowship.

The western section of the Alliance of Reformed Churches holding the Presbyterian system in the United States and Canada met from year to year and promoted the close relationship between the Presbyterian and Reformed Churches. Delegates from Europe and from the far east were present on various occasions to continue the link with the churches across the seas.

In 1940, all churches of the Presbyterian family joined in the national preaching mission by which a series of evangelistic meetings and conferences over a period of 8 days was held in 22 leading cities of the United States. The central theme in these meetings was "Christ is the Answer" to disturbed world conditions. A deepening sense of oneness in faith was secured by the yearly observance of world-wide communion on the first Sunday in October.

With the entrance of the United States into World War II, the churches of the Presbyterian family, through their official bodies, co-operated with the government to provide for the spiritual life of the men in the service of their country. Through a general commission on army and navy chaplains, of which the churches were members, ministers were selected to serve as chaplains in the armed forces. By Dec. 31, 1943, 996 ordained ministers of the Presbyterian and Reformed Churches in the United States were in the service as chaplains, and in July 1945 the number was slightly more than 1,300. To keep a contact with the chaplains in the field, churchmen were sent on visits through the general commission and other interdenominational agencies, and on invitation of Pres. Franklin D. Roosevelt the church sent the chairman of the general commission, Dr. William Barrow Pugh, a Presbyterian clergyman, to visit the chaplains in the theatres of war operations in Europe, Africa, Asia, South America and later to the Pacific. The congregations put forth special efforts to support by contributions the demands to provide spiritual and material help to the chaplains.

Notable in this endeavour to aid restoration was the campaign launched by the Presbyterian Church (U.S.A.) to raise a restoration fund of \$27,000,000 to aid the Protestants of Europe, to rehabilitate Presbyterian interests and institutions in the far east and to strengthen some phases

of Presbyterian work in the United States that arose as a result of the war. The report of the wartime service commission to the general assembly as of May 1, 1946, showed that the returns had reached \$4,442,177. On Dec. 2, 1946, the report of the Restoration Fund commission revealed that the returns had reached \$18,191,271, or 67.4% of the goal.

Throughout the decade the response of the congregations for funds helped to undergird the work of the churches at home in a number of worthy causes. The Southern Presbyterian Church engaged in raising a \$3,000,000 "Accrued Liability Fund" to put its ministers' annuity fund in operation. The Reformed Church in America and the United Presbyterian Church of North America took steps to provide adequate pensions for their ministers. A \$10,000,000 sesquicentennial fund was raised by the Presbyterian Church (U.S.A.) for the support of the work of that church in its colleges and in certain universities.

In the closing year of the decade, the Reformed Churches holding the Presbyterian system, within the United States, numbered 12 and included 18,351 ministers, 18,569 churches and 4,126,878 communicant members, with approximately 8,000,000 adherents. After the war many missionaries returned to their former fields of labour to aid in the great task of restoration and to further the unity of the Christian Church throughout the world.

Europe.—As in the United States, so in Europe there was an active movement in the direction of union of the Reformed Churches before World War II. In 1933, the national synod of the Reformed Evangelical Church and that of the Reformed Church of France had initiated a movement "officially to undertake the common study of problems relating to the unity of Protestantism, its conditions, and the extent to which it has been realized in the ecclesiastical, doctrinal and disciplinary spheres." After a series of negotiations, a draft declaration of faith was unanimously adopted at a plenary meeting in which the synod of the Union of Free Churches and the Methodist Church of France took part. In 1938, a general assembly of representatives of all four churches approved a common declaration of faith, common liturgies and rules of order. When the synod of the united church met in May 1939, there were 448 parishes with 597 congregations and 513 other preaching points in the church. A minority group of Reformed Evangelical French Churches, representing from 45 to 65 congregations and numbering about 15,000 communicant members did not join in the union. With the outbreak of World War II, the religious life of France was seriously affected by the course of events.

The Reformed Church of France suffered immeasurably from the invasion by the Germans. At the very outset of the war many members of this church were among the 500,000 persons evacuated from the frontiers. With the invasion of France and the resultant displacement of many people, the Reformed Church made every effort to maintain its unity among the three zones into which it had been divided: the occupied, the unoccupied and the prisoners' camps in Germany. That some success in maintaining this unity was realized was apparent from the fact that in Aug. 1941, at the annual meeting of the national synod, all zones were represented. Although the church suffered by the arrest of many of its outstanding leaders, and by the general restrictions upon its freedom, it endeavoured to keep alive a sense of solidarity by occasional meetings.

In May 1943, the national synod sent a formal appeal to the church members for "faithful endurance in a land of measureless suffering." Congregations were without the

services of ministers in some areas because of forced labour, internment and imprisonment of the clergy and theological students. In 1944, the national synod reported that 595 pastoral posts were being served by 393 pastors. In June 1945, the national synod addressed a vigorous message to pastors and members to a life of "work and faith" in the performance of "heroic and outstanding duties" amid indifferent standards of social life and immorality in France. For the restoration of church life in France, the national synod in May 1946 emphasized the nature and responsibilities of the pastoral ministry.

In other sections of Europe, war, conquest and mass evacuation laid tremendous burdens on the Reformed Churches of Europe. The progress that had been made before the war in movements toward unity helped to maintain faith, vitality and hope. Churches contributed money for the care of their own members and to the work of churches in other lands. In general the churches were crippled by loss of personnel to the army and navy, destruction of churches, hospitals and other property and by the presence of many refugees from other parts of their own land or from other countries. The partition of some areas broke up church organizations. In central Europe, the Vienna arbitration divided the Transylvania Reformed Church in two—two-thirds of the parishes went to Hungary, and the rest, comprising 251 parishes with about 238,000 persons, remained in Rumania.

The miseries of the war produced a certain lethargy which affected both ministers and congregations. To overcome this state, emphasis was placed upon evangelization for the whole church. Although some congregations were reported as being larger than before the war, the outlook for training ministers was depressing because of the lack of funds for maintaining theological institutions and the poverty of the students. Capital and the value of contributions decreased markedly as a result of inflation, and land was lost under agrarian reforms. Such general chaotic conditions prompted the synodical council of the Hungarian Reformed Church at its first meeting in May 1946 to acknowledge its failures and to confess its faith in an exemplary Christian life. It condemned the measures against the Jews, and expressed the conviction that true reconstruction was possible only on the basis of humanity and in the spirit of the Gospel. A free council of Protestants was formed in 1946 to voice the church's position in matters of national significance and church co-operation.

In Czechoslovakia the Protestant and Free Churches had grievous restrictions placed upon them when overrun by the invading forces. Censorships were placed upon sermons. Hymns that were prayers for the fatherland and for God's protection, in the hymn book of the Czechoslovak Church, were forbidden. The central authorities of all the churches received directions and orders either directly from the reich protector's office or through the intermediary of the Czech ministry of education. In 1946, reports from Czechoslovakia indicated that religious freedom there was greater than for many years. Religious instruction was given in the public schools, the Theological Faculty was reopened after six years and reconstruction was being carried out under moral and spiritual influences.

In Italy, the Waldensian Church carried on its services in the face of dictatorship and war. The occupation of Italy by the Germans added to the hardships of this church. Since the war relations between the church and state had not been clearly defined and materials for rebuilding were

granted only to churches of the state religion, restoration was delayed. At a meeting of the synod of the Waldensian Church in Sept. 1946, a group was commissioned to launch a campaign for evangelism that was facilitated by the grant to broadcast religious services from stations in some of the chief cities.

In many of the smaller countries where the Reformed Church continued to exist, the experiences of the congregations were as harrowing and cruel as those in the larger countries. Congregations were scattered, church buildings destroyed and many members imprisoned and persecuted. In the Netherlands during the German occupation, young members of the underground suffered death by torture in Germany, and many ministers were imprisoned and some shot. In Poland, Lithuania and the Ukraine, the existence of the Reformed Churches as organized bodies practically ended during the war. But reports indicated that the work did not cease. In the Ukraine, it was reported in 1944 that 4 Reformed preachers served 30 congregations. After the war, the Protestant Churches in Poland created an official council of Protestant Churches recognized by the Polish government as the official organ of the Protestant Churches. The outlook for the Reformed Church in Greece, which suffered severely during the war, was brighter. In Sept. 1946 the general assembly of the Greek Evangelical Church met for the first time after 1939. In resolutions it emphasized the need of evangelization and the importance of having the scriptures available in the vernacular for the spiritual growth of the people. (W. B. Pu.)

Presidents, Sovereigns and Rulers

For the names of all heads of state during the decade 1937–46, see articles on the individual nations concerned.

Preysing, Conrad von

Cardinal von Preysing (1880–), German prelate, was born at the Castle Kronwinkel, in the archdiocese of Munich on Aug. 30, 1880, of royal parentage. He attended Munich and Wuerzburg universities but abandoned a diplomatic career in 1908 for the priesthood. Educated by Jesuits at Innsbruck, Austria, he was ordained in 1912 and was elevated to the bishopric in 1932. Three years later he was transferred from the see of Eichstaett to the see of Berlin.

An outspoken foe of nazism, Preysing denounced nazi treatment of the Catholic Church in a pastoral letter read from the pulpits of all Berlin's Catholic churches on Dec. 5, 1937. He risked possible imprisonment in Dec. 1942 with issuance of a Christmas letter, addressed to Catholics in Berlin, denouncing nazi oppression of racial minorities, execution of hostages and enslaved peoples and application of the doctrine of mercy deaths. He urged the Germans to disavow their nazism and change "their mode of thinking."

He was proclaimed cardinal by Pope Pius XII Feb. 18, 1946.

Price, Byron

Price (1891–), U.S. journalist and government official, was born March 25, 1891, in Topeka, Ind. He was graduated from Wabash college, Crawfordsville, Ind., in 1912 with a B.A. degree and went into newspaper work. Joining the Associated Press in 1912, he was later transferred to the Washington bureau. He enlisted in the army after the U.S. entry into World War I and returned to the Associated Press after the Armistice. He was news editor of the agency's Washington bureau (1922–27) and was appointed executive editor of the entire organization in 1937.

On Dec. 16, 1941, he was appointed director of the Office of Censorship. Although Price co-operated with other government agencies and departmental heads in fulfillment of his duties, he was given a great deal of latitude in deciding what was or was not censorable.

After the defeat of Germany in May 1945 the Office of Censorship relaxed many restrictions on information concerning movement and identity of troops in the European theatre; censorship restrictions concerning troop movements in the Pacific-Asiatic area, however, were retained until the end of the war. After liquidation of the Office of Censorship, Price was named by President Truman, Aug. 30, 1945, as an adviser on public relations in the U.S. occupation zone in Germany. After leaving government service, Price was appointed, on Dec. 5, 1945, vice-president of the Motion Picture Producers and Distributors of America.

Price Administration, Office of

The Office of Price Administration, a U.S. government agency, was empowered by act of congress in Jan. 1942 to stabilize prices of goods and services, as well as residential rentals. OPA was also empowered by presidential directive to ration goods made scarce by U.S. participation in World War II.

The U.S. rearmament program launched in May 1940 and the commitments arising out of the Lend-Lease act of March 1941 brought acute pressures to bear upon the nation's price structure. Rapid expansion of governmental military outlays increased national income at an unprecedented rate and at the same time levelled off the volume of goods available for civilian use. The resulting gap between enhanced consumer purchasing power and lowered civilian supplies resulted in a situation which, if unchecked, could have worked severe hardship on the population and seriously impeded the defense program.

The Advisory commission to the Council of National Defense, appointed in May 1940 to direct the nation's armament program, undertook the functions of price stabilization and consumer protection. Under presidential executive order these functions were taken over in April 1941 by the Office of Price Administration and Civilian Supply. Through a system of selective controls, OPACS had endeavored to stabilize about one-half the price structure prior to the retail level. Having no legislative authority and therefore no power to enforce formal orders, OPACS had to rely chiefly on informal controls. Four such types of control were used: suggestions to the industry; fair price requests, which made public a list of prices deemed to be fair and requesting industry adherence; "freeze" letters, directed to members of an entire industry whose prices were out of line, calling upon them to hold their prices to the level of a specified date; and voluntary agreements, by which an industry volunteered not to exceed the price level of a specified date, or not to raise its prices without prior notification to OPACS. In

addition, formal price schedules had been issued on a number of basic industrial materials.

“General Max.”—Existing price schedules, covering a number of commodities at producing and wholesale levels, were at once reissued as “regulations” within the meaning of the law, and a general order (General Maximum Price regulation) was promulgated covering retailers as well as producers and wholesalers, by freezing prices at March 1942 levels for virtually everything the U.S. family wore or used, and for about 60% of all foods.

cost of living and consequent cutting into the purchasing power of wage income was making it impossible to stem inflationary wage increases. An accelerated rise in wages and in farm prices would have breached the controls over industrial prices. To remedy this situation, President Roosevelt called upon congress to amend the price control act, and in Oct. 1942 the Stabilization act of 1942 was passed, giving OPA power to extend control over food prices, and simultaneously providing a statutory basis for stabilization of wages.

OPA was thus enabled to set ceilings on about 90% of retail food prices. To strengthen controls further, pricing of many commodities was transferred from the General Maximum Price regulation to specific maximum price regulations designed to meet the needs of the particular industry or commodity, thus correcting the disruptions in normal flow of goods which had in some cases followed the general freeze of prices. At the same time, OPA began to set specific dollar-and-cent ceilings, replacing the general freeze prices on a number of items. The accumulation of pressures resulting from the increases which had occurred prior to passage of the act was so great, however, that the cost of living continued to rise alarmingly. From Oct. to May 1943, consumer prices as a whole had increased by 5.1%, chiefly because food prices alone had advanced 10.3%. In recognition of this situation, President Roosevelt issued an order directing the price administrator "to take immediate steps to place ceiling prices on all commodities affecting the cost of living . . . to authorize no further increases in ceiling prices except to the minimum extent required by law . . . to prevent further price increases direct or indirect, to prevent profiteering, and to reduce prices which were excessively high, unfair, or inequitable."

Following this "hold-the-line" order, the price administrator announced a four-point program providing for the extension of price control to important commodities, pre-

viously exempt, the extension of specific dollar-and-cent prices for food and setting up of a retail community food price program throughout the country, the reduction of certain food prices which had risen unduly before control could be imposed and more vigorous enforcement. In rolling back some food prices, payment of governmental subsidies to processors was authorized to enable them to continue paying legal farm prices for raw products despite reductions in retail prices. Payment of subsidies for cost-of-living items was chosen as a means of lowering consumer prices because of their effectiveness in preventing unnecessary price increases in war goods purchased by the government, as well as their success in the stabilization programs of Britain and Canada. Under this broad program, food prices were steadily reduced and by Sept. had fallen nearly 4% below the May peak. The cost of living, as indicated by official indices, held fairly steadily until the war's end, consumer prices in Aug. 1945 having advanced only 3% beyond those prevailing in May 1943. Primarily responsible for the rise that did occur were clothing and textile prices, and to a somewhat lesser extent, prices of miscellaneous items, including personal services and theatre admissions which OPA was not authorized to control. Clothing prices from May 1943 to Aug. 1945 had risen 14.5% and house furnishings 16.7%, largely because of the disappearance of low-priced articles from the market as manufacturers channelled production into higher-priced goods.

In an effort to combat the continued increases in prices for clothing and textiles, OPA early in 1945 had issued maximum average price orders for garment manufacturers and woollen and rayon mills which required each producer, by balancing deliveries of higher-priced lines with lower-priced goods, to maintain an average price for his deliveries during each quarter at or below his average price during the specified base period. Adjustments were made from time to time to fit the program to existing supply conditions. A companion program by the Civilian Production Administration channelled production of textiles to manufacturers of certain popular-priced essential garments. For most low-priced cotton apparel, OPA established dollar-and-cent prices and required manufacturers to affix the retail ceiling price to each garment. While these measures did not succeed in rolling back the average of clothing and textile prices, they were on the whole successful in again making some lower-priced garments available for consumers.

Reconversion Pricing.—As early as the summer of 1944, OPA had begun planning for the postwar reconversion period. The problem was threefold: first to establish prices for consumer goods which had been entirely or largely off the market because of wartime restrictions; second, to provide adjustments in ceiling prices for manufacturers of other goods who were finding it difficult to continue production at existing price levels; and third, to provide for orderly decontrol of commodities as soon as it appeared probable that balanced supply and demand would keep prices from rising unduly.

The arrival of V-J day found the agency ready to launch its program for the critical transition period, determined that the pricing process would not hamper expansion of production for peacetime use. The OPA record to that time was impressive. Production during the war broke all records and in both industry and agriculture expanded approximately five times as much as during World War I. Price increases were far less than during the

first war, and after the spring of 1943 a high degree of stabilization was attained.

Measuring in each case from the last month of peace, the official indices showed consumer prices up only 31% by V-J day, exactly one-half the 62% rise that took place by the Armistice in 1918. Wholesale prices had increased only 41%, as compared with a rise of 102% by the Armistice. From May 1943 to Aug. 1945 the rise in consumer prices had been held to 3% and that of wholesale prices to less than 2%.

The special pricing formula finally worked out for reconversion goods adjusted maximum prices for reconverting industries to reflect cost during the last period of normal production, adjusted for subsequent lawful changes in materials prices and in basic wage rate schedules of factory workers, plus the industry's peacetime profit margin over costs. This formula did not attempt to take into account all the factors which had affected production costs since 1941. It ignored some factors which temporarily increased costs, such as dislocation of supply, less efficient labour and payment of overtime rates and shift differentials; but it similarly ignored factors which had decreased costs, such as the ease of selling and the effect of technological progress achieved in many industries during the war period.

This reconversion formula was also applied to some industries which had continued to sell on the civilian market throughout the war at prewar prices, offsetting losses incurred on these products by highly profitable military sales to the government. The levelling off of sales to the military after V-J day, however, made price adjustment necessary on civilian sales.

Pending issuance of industry-wide price increases for reconverting industries after review of price ceilings, an adjustment mechanism was set up for individual reconverting producers who needed immediate adjustments. This adjustment procedure was also used for cases in which the industry-wide price increase was inadequate for an individual producer, and for cases in which there had been no request for industry-wide review of price ceilings. Virtually automatic pricing was thus provided for about two-thirds of all reconverting firms. Authority was delegated to OPA field offices to act upon more than 90% of such applications for adjustments.

The first of the industry-wide reconversion increases was issued just a month after the Japanese capitulation, and by the following spring initial increase factors had been issued for virtually all of the reconversion industries. A good many of these factors had to be revised, however, in view of subsequent changes in price policy which are discussed below.

Another price adjustment policy adopted after the cessation of hostilities was to permit price increases wherever existing ceilings would prevent expansion of production for peacetime needs. In addition, a general adjustment program was established to keep individual manufacturers from remaining in a loss position.

In the months immediately following V-J day, OPA endeavoured to prevent consumer prices from rising by requiring wholesale and retail sellers to absorb a substantial part of the increases granted manufacturers. Under OPA standards, however, no trade was required to absorb cost increases if its earnings would thereby be reduced below base-period levels. Where the base-period earnings standard was not impaired, a distributor could be required to absorb a manufacturer increase to the point where his ceiling price covered his total cost of handling the product. In the case of reconversion products

which in normal times constituted the bulk of the distributive trade's normal business (such as automobiles or electrical appliances), however, the distributive trade was permitted to maintain its average peacetime realized margin on the product or group of products.

Because of the relatively moderate producer increases which implemented reconversion pricing policy and because of the "absorption" of manufacturer price increases required at intermediate distributor levels, consumer prices held at Aug. levels in the six months following. A change in the government's wage-price policy, announced in Feb. 1946, however, caused a dent in the cost-of-living line, which had held firmly since May 1943. Under the new policy, the basis upon which wage increases could be granted was greatly broadened, and OPA was directed to permit ceiling prices to reflect higher labour and materials costs for those industries which otherwise would not earn their base-period return in the ensuing 12 months. During the war, OPA had frequently acted to adjust price ceilings in order to maintain generally fair and equitable prices, according to the intent of congress, or to offer incentive for the production of scarce items needed in the war economy.

Adjustments had also been made when found "necessary to a swift and orderly transition to a peacetime economy." OPA allowed an average of 65 industry-wide price increases per month in the period between V-J day and the enunciation of the new wage-price policy. In the ensuing 4 months, however, an average of 130 industry-wide increases was allowed each month. At the same time, OPA relaxed somewhat its rules regarding absorption of rises in producer ceilings, and an increasing number of these was passed through to consumers. The effect of the new policy was immediately seen in the official indices. Wholesale prices in June 1946 were almost 5% over those of the preceding Feb. and consumer prices rose almost 3%. These increases were small, however, compared to those that occurred during the remaining months of 1946.

Amendments by Congress.—From the beginning of its

statutory life OPA had been reviewed by congress each year after extensive hearings as to the need for and the efficacy of the act. After the initial passage of the Emergency Price Control act and the Stabilization act in 1942, the annual extension or appropriation acts for the most part curbed some specific phases rather than broadened the legal powers of the agency. Thus, in 1943, congress severely limited use of grade labelling or standards in establishment of ceiling prices. It also stipulated that any person who directed the formulation of any price policy, maximum price or price ceiling had to be qualified by experience in business, industry or commerce; this was the so-called "anti-college-professor amendment."

In the Stabilization Extension act of 1944, congress required that prices for each of the major products made from cotton or yarn, including at least 80% of all cotton textiles by volume, should separately reflect the parity price to growers, whether or not such a price was actually paid. (Parity prices were determined and published by the secretary of agriculture and reflected a price which, if paid to farmers, would currently give the commodity a purchasing power, with respect to the articles farmers buy, equivalent to the purchasing power of the commodity during a base period—in most cases 1909-14.) Other amendments passed at this time which led to higher prices directed OPA to make adjustments in ceilings for fresh fruits and vegetables whenever weather or some unforeseen disaster substantially reduced the crop yield, and to keep prices for any fishery commodity at levels not below the 1942 average for the commodity.

In 1945, with the war in Europe already over and the capitulation of the Japanese in sight, congress further liberalized price control, providing that prices on meat products should permit the meat-packing industry as a whole to earn a profit on the processing of each species of meat, and that cattle and calves, lambs and sheep, and hogs were to be separately considered.

The elimination of virtually all wartime controls except those over price, shortly after V-J day, led to a great deal of pressure upon the government to remove these controls also. However, the huge reservoir of unsatisfied consumer demand and the accumulation of liquid savings together with the abnormal volume of currency in circulation and the continued large government expenditures did not permit rapid and indiscriminate removal of price controls. Under the law OPA was to expire June 30, 1946, and congress was confronted with the problem of weighing the inflationary situation to determine the need for again extending price control. Congressional committees began hearings on extension early in Feb. and touched off a powerful drive on the part of nearly all industrial business and farm organizations to abolish OPA or severely limit its powers.

After months of acrimonious debate in committee and in congress itself, a much weakened price control extension bill was presented to the president for signature just a few days before the law was to expire. This bill President Truman vetoed on June 29, 1946, as a "choice between inflation with a statute and inflation without one," declaring his most fundamental objection being to the numerous amendments which would raise the price of essential cost-of-living commodities.

Decontrol.—All price controls therefore lapsed at midnight on June 30, 1946, and a free market prevailed until July 25, when a new extension act became valid. In continuing OPA until June 30, 1947, congress seriously modi-

"Waiter Trouble." A *Chicago Tribune* cartoon by Parrish, on the nature and causes of U.S. food shortages during World War II

fied its authority and shifted the emphasis of the law from general control of prices to decontrol. Specific restrictions were placed on the methods used by the agency in fixing maximum prices assuring a higher price level for some commodities, control of agricultural prices was transferred to the secretary of agriculture and an independent Price Decontrol board was created. Payment of government subsidies to producers, moreover, was greatly circumscribed, extension of payments to new commodities and increases over previous rates being prohibited (sugar exempted), as well as all payments on commodities freed from price control, except for petroleum from stripper wells. Termination of most subsidy payments by April 1, 1947, was directed.

Price ceilings in effect June 30, 1946, were immediately restored on all goods and services not explicitly decontrolled in the act. Residential rents, consumer and industrial goods and about 40% of food products were thus recontrolled. Uncontrolled pricing was continued until Aug. 21, 1946, for poultry, eggs, tobacco, grains, livestock, milk, cottonseed, soybeans and petroleum. Feeds made from grains and food or feed products made in whole or substantial part from these listed commodities also remained free of control. Final responsibility for recontrol of these commodities was placed upon the Price Decontrol board. Cotton was permanently exempted from control. The Price Decontrol board on Aug. 20 unanimously decided upon the recontrol of livestock and meat, edible fats and oils, soybeans, flaxseed, mixed feeds and by-product feeds. The other listed commodities were continued on the free market.

Criteria for bringing any product back under control were: (1) that the price had risen unreasonably above the maximum price on June 30, 1946, plus subsidies payable as of June 29; (2) that the commodity was in short supply; (3) that regulation was practicable and enforceable; (4) that the public interest was served by restoring ceilings.

The law also provided for decontrol of all items "not important in relation to business or living costs." This policy had already been pursued by OPA since V-J day, but the act stipulated decontrol of all such nonessentials by Dec. 31, 1946. In addition, decontrol was ordered whenever supply of a nonagricultural commodity equalled or exceeded demand, a policy also previously followed by the agency. Explicit provision was made, however, for industries to petition OPA for removal of ceilings from nonagricultural commodities and the secretary of agriculture for removal of ceilings from agricultural commodities, with final authority for review resting with the Price Decontrol board.

The immediate effect of the new price control law was a flood of OPA orders removing minor items from price control and raising prices for products still under control. In the first month following the effecting date of the new act, more than 300 industry-wide price increases were allowed, at least half of which were specifically required under the new act. A good many of the other increases, while not required under the law, originated to a large extent in the new law since price rises were allowed on secondary products, passing on required increases on component materials in order to maintain production of needed commodities. Virtually all of these increases were passed through to the consumer since the new act prevented OPA from requiring distributors, where possible, partially to absorb rises in producer prices.

The result of these actions, together with the effect of

releasing thousands of items from control and of the 25 days of free markets, was at once apparent on price levels. In the four weeks following suspension of price controls at the end of June, the wholesale price index rose 10%, the largest advance being in food prices, which rose 24%, while the over-all increase in the consumer price index from mid-June to mid-July was almost 6%, with food alone rising 14%. Both wholesale prices and consumer prices continued to rise, and by the fourth week in Nov. wholesale prices were 23% above levels prevailing before the June 30 temporary suspension of control. The all-over wholesale index was almost 32% above the V-J day level, with food prices up 54%. The total consumer price index in mid-October was 11% higher than in June, 15% higher than in Aug. 1945; and 51% above Aug. 1939; consumer food prices in Oct. 1946 were 24% higher than in June, 28% higher than on V-J day and 93% over Aug. 1939.

On Oct. 15, the president directed the removal of price control on meat and livestock and on food and feed products manufactured therefrom. Congress had temporarily decontrolled these products and the Price Decontrol board had reinstituted control as of Sept. 1, after extensive hearings. In the six-week period that they had been recontrolled, however, the meat supply had dropped off so drastically that the meat shortage became a burning political question for which OPA served as the national whipping boy. The process of releasing commodities from price control was also greatly accelerated in accordance with the president's direction. Within a week, price controls were lifted from all foods except rice and sugar and some sugar syrups. Decontrol of other commodities followed rapidly and on Nov. 9 the president directed "the immediate abandonment of . . . all control over prices except that necessary to implement the rationing and allocation programs of sugar and rice." He reached his decision, he said, because so much of the economy had been freed from price controls that distortions in production and diversion of goods were far outweighing any benefits.

Rent Control.—The reasons impelling the lifting of price controls, however, were not applicable to controls over residential rents, and these continued throughout 1946. Under authority of the Emergency Price Control act, OPA began to regulate residential rents in 1942. In so doing, the country was initially divided into 459 defense rental areas with rents in each area frozen at the level prevailing on a specific date, in most cases March 1, 1942. By the close of 1946, rent control regulations covered more than 20,000,000 nonfarm dwelling units (houses, apartments, hotels, boarding houses, etc.) in 650 defense rental areas where more than three-fourths of the U.S. population resided. Upward pressure on residential rental ceilings became even sharper after V-J day, permitting decontrol in relatively few areas where war activities, such as military training camps, had ceased, and necessitating extension of control to many new areas where return of ex-service men and defense workers and their families to their former homes or to schools and universities sharply increased the housing shortage. During the debate on the price control act extension in 1946, congress twice rejected moves for a general increase in rental ceilings. The rent control program was one of the most successful undertaken by OPA, having been highly effective in holding residential rentals virtually stable throughout the war and keeping the total rise from Aug. 1939 to Sept. 1946 to a little more than 4%.

Rationing.—Rationing of sugar continued throughout 1946, the sole commodity under rationing control since the close of 1945. Throughout the war years OPA was

authorized by presidential order to ration items made scarce by the war. The delegation of this authority to OPA was first made experimentally on Dec. 27, 1941, when hostilities in the Pacific choked off rubber imports from the far east, and it became clear that automobile tires would have to be equitably distributed to essential users. Tires, automobiles and typewriters were among the first commodities upon which the impact of war was felt. They were rationed by certificate, as were bicycles. But by the end of 1942, the use of coupon books in rationing was well established. The first war ration book, put in use in 1942, provided coupons for sugar, then also for coffee. A separate coupon book was issued for gasoline, and coupon sheets were issued for fuel oil. Point rationing was started early in 1943 for meats, fats, and oils, butter and cheese and processed foods. Also brought under nation-wide rationing in 1943 were coal and oil heating and cooking stoves and shoes. At its peak, OPA administered 13 rationing programs.

Reduced military demand, releasing large stores of supplies to the civilian population, made it possible for OPA to end its rationing programs for all but sugar and rubber tires before the close of Nov. 1945. Rationing of processed foods, gasoline, fuel oil and stoves was terminated immediately after the Japanese surrender, and rubber footwear, canned milk, cheese, automobiles, shoes, and meats, fats and oils in the following two months. Rationing of rubber tires was ended at midnight Dec. 31, 1945.

Administration and Administrators.—Price controls and rationing were administered through a national office in Washington, D.C., responsible for the development of regulations and policies, but a major part of the activities were carried on in the field through 9 regional offices, 93 district offices and 5,661 local war price and rationing boards at the peak of activities, when 63,426 paid workers were employed, supplemented by services of as many as 235,000 volunteers at local board levels. The number of boards was reduced drastically following the ending of all rationing programs but sugar, and the remaining 1,642 boards, which had been chiefly responsible for supervision of prices in retail stores, were finally closed on Nov. 4, 1946. Likewise, the number of paid employees, which had dropped to 35,000 by the autumn of 1946, was down to 16,000 by the close of the year.

Leon Henderson was appointed to the National Defense Advisory commission in May 1940 as commissioner in charge of the Price Stabilization division. He was named administrator of OPACs (subsequently OPA) in April 1941. Prentiss M. Brown succeeded him in Jan. 1943. Chester Bowles, who had been appointed general manager of OPA in July 1943, became administrator in Oct. 1943. Bowles served until Feb. 1946, when he became director of stabilization. He was succeeded by Paul A. Porter, who remained as administrator until Dec. 1946, when Max McCullough became acting administrator during the interim when a merger of government war agencies was being completed.

On Dec. 12, 1946, the president issued an executive order creating the Office of Temporary Controls under which the continuing responsibilities of OPA were consolidated with certain other government war agencies. Major General Philip B. Fleming, Federal Works administrator, was named by the president to head the new agency. (See also

Prices

In April 1937, U.S. wholesale prices reached 88.0 (as measured by the United States department of labour, bureau of labour statistics, using the average of 1926 as equal to 100) after averaging 64.8 for the depression year of 1932. During this upward climb of prices, the Roosevelt administration had sponsored minimum prices, minimum wages, the National Recovery administration's industrial codes frequently forbidding sale below cost in an effort to stifle competition, the destruction and restriction of farm production in an effort to raise prices, and "pump priming" (a term applied to the government's policy of deficit spending in an effort to raise the level of business activity). By 1937, the United States was enjoying a level of business activity considerably higher than that of the early '30s. However, the part played by the federal government in bringing about this rise in prices was uncertain and was still being debated ten years later. The wholesale price movement turned down after March 1937 and was followed by a downturn in business activity in the late summer. Although business activity dropped rapidly through the spring of 1938 and then recovered, wholesale prices declined gradually and continued to decline through Aug. 1939, at which time the combined index rested at 75.0.

The price decline during this period was not uniform for all classes of products. The overall index declined 15%, but raw materials prices declined 25% while finished goods declined less than 10%; farm products dropped 34%, food products 21%, and "all others" only 7%.

When the war in Europe broke out in Sept. 1939, there was a temporary flare-up of inflationary trends. In many commodities the immediate price rise amounted to 30% or 40%, principally in raw materials and commodities which had experienced large price rises in World War I. Farm and food prices recovered a substantial part of the position they had lost during the decline from 1937. The rise in the combined index from 75.0 in August to 79.4 in October was much less sharp than that in many individual prices, because of the inclusion of a number of different articles and many manufactured goods normally more stable in price. During these months retail prices and the cost of living increased, but, customarily, the movement was not as great as in wholesale prices and lagged slightly.

The rise was only temporary, and by Feb. 1940 wholesale prices had started down again. The decline was in part because of a slackening of forward buying in the dis-

Table I.—Wholesale Price Index in United States
1937-1946

rupted commodity markets, to ample supplies of goods aided by a relaxing of import restrictions on sugar, rubber and tin, and to large unused productive capacity. By the end of the summer, wholesale prices started to rise from their low of 77.4. Although the rise which started at this time was considerably dampened by wartime controls, it continued through Dec. 1946, when the combined wholesale price index stood at 140.9.

The rise in the late months of 1940 was attributable mainly to the impact of World War II on the economy of the United States and its attendant effect upon industrial production. Speculation during this price rise at the end of 1940 was much less pronounced than it was a year earlier at the beginning of the war. Except in isolated instances there were no speculative rises produced by forward buying. This fact was notable, since the volume of new orders to manufacturers was even greater than a year earlier. The situation prevailed because of a lingering depression psychology, because of a realization that such price rises were unwarranted in view of the unused productive capacity, and because of the government's determination to prevent price maladjustments. The Price Stabilization division of the Defense Commission took direct action against certain excessive price rises. Even the threat of such action in other cases prevented prices from getting out of hand. A system of priorities was also established whereby a manufacturer of war materials would receive the necessary quantity in preference to civilian production without the necessity of bidding up the price to assure himself of adequate materials to fill the contracts.

Spectre of Inflation.—By the end of 1940, the possibility of inflation was generally realized, but it was not generally feared. The labour supply was ample and raw materials were abundant. There was general confidence in the ability of peacetime industry to convert to defense production and in private and governmental efforts to hold back inflation. Governmental action on priorities and in assuring adequate supplies was believed to be very helpful. One example was the lifting of the requirement that all army uniforms be made from wool raised in the United States. Another was the willingness to sell surplus foodstuffs that had been purchased during the 1930s in the programs to raise farm prices. The American Federation of Labor also went on record with a statement that it was unfair to ask for a pay increase if it would raise prices.

In Dec. 1940, the combined wholesale price index stood at 80.0 as contrasted to 79.2 a year earlier. By the end of 1941, it stood at 93.6, 16% higher. During this period the cost of living index, usually a sluggish mover as compared to wholesale prices, increased 10%. The rise in the combined wholesale index was brought about by the magnitude of the defense effort, and by its direct and indirect effects. Enlarged payrolls increased the amount that consumers had to spend. All prices moved ahead under such circumstances, for though the government increased taxes markedly, more than a fifth of its expenditures were financed by bank credit. Much of the private expansion was financed through the same source. In 1940, these factors had not combined to raise prices. In 1941, however, the extent of the activities was greater; many plants were operating at capacity and a shortage of skilled labour was developing. Transportation was proving a bottleneck particularly for imported commodities. Wage rates were advancing and the government's farm support program, a carryover from the days of the New Deal, was increasing the amount of money in the hands of the farmers. With

all of these factors threatening to bring on inflation, the government's demand for war materials continued to grow and intensify each factor. The major factors which restrained the inflationary tendencies at this time were the desire of the people to avoid it and the government's efforts to combat it. Widespread ceilings were imposed, plant capacity was expanded where possible, scarce raw materials were rationed, taxes were increased and sales of defense bonds to individuals were promoted.

By June 1941, the ocean shipping situation was becoming serious. Available tonnage was shrinking because of sinkings and less efficient utilization caused by round-about routing and convoying. Rates for freight and insurance were both advancing, and in many instances there were priorities and preferences as to the allocation of available space. All of this tended to increase the cost of imports and to restrict their amount. The greatest difficulties were experienced in shipments from India and the East Indies. South American rates and shipping had not become as difficult.

The Bankhead-Fulmer act, passed in May 1941, continued the New Deal program with respect to agriculture. This act required the Commodity Credit corporation to offer crop loans to growers of wheat, corn, cotton, rice and tobacco amounting to 85% of "parity." Previously, the loan rate had been 56% on cotton and wheat and 75% on corn and tobacco. These loans were at a substantially higher percentage than those granted under the Agricultural Adjustment acts of the 1930s, and, as other prices had risen, parity had been raised. Because of the terms of these loans they amounted virtually to sale to the government at guaranteed minimum prices. This action, in addition to raising prices on the five commodities specified, also tended to raise the price of livestock, poultry and dairy products. In 1942, these crop loans were raised to 90% of parity and by 1944 the loans on cotton were raised to 95% of parity. In 1944, farm prices were given an additional boost through assuring the farmers the higher of parity or the highest price received between Jan. 1 and Sept. 15, 1942.

A substantial inflationary pressure was placed on prices because the total pay rolls of the country were increased tremendously at the same time that the supply of civilian goods was declining. The workers were being paid on the basis of total production and could buy only a fraction of that production. The difference was the so-called inflationary gap; to close this gap was one of the government's objectives in the attempt to control prices. Attempts were made to close it from both sides—to increase the amount of goods available to consumers and to decrease the amount of money they could spend for goods and services.

Table II.—The U. S. Inflationary Gap, 1942–44
(in billions of dollars)

	1942	1943	1944
Income payments to individuals	\$115.5	\$142	\$152
Available goods and services	78.2	88	89
Gross inflationary gap	37.3	54	63
Absorbed by personal taxes	6.6	16	21
Remainder to be closed by savings, paying higher prices, or paying higher taxes or some combination of these	30.7	38	42

Early in the defense period an attempt was made to increase the volume of available goods through encouraging an increase of production facilities. This device for closing the gap was not successful at the time because of the intense demands of the war effort and did not come into important use until after the end of the war in 1945. The reduction in the amount of excess purchasing power proceeded along several different paths. Increased income and excise taxes were levied, and defense (later war) bond campaigns were widely used. Through educational cam-

paigns, the consumer was shown the wisdom of paying off debts and building up a fund for the purchase of durable goods at the end of the war. Through the federal reserve system the extension of credit to consumers was substantially curtailed, and steps were taken to limit the potential bank credit expansion based on their large excess reserves.

Necessity for Control.—These devices were not completely successful in closing the inflationary gap, and as a result direct price controls were instituted. Controls began in 1941 and became almost complete in 1942. The first price ceiling was placed on used machine tools in March 1941. Aluminum scrap and zinc scrap followed in the same month. By the end of the year there were 54 commodities under stipulated price schedules. These early price controls achieved only limited success, as they were incomplete and based merely on executive order without provisions for enforcement through the courts.

The continued price rise under these stop-gap provisions led to the introduction in congress of the General Price Control act in the last part of 1941. Its major objectives were to avert and restrain the inflationary rise in prices which, if continued, would add to the monetary cost of the war, cause disorder in business and contractual relationships, and raise the general price level with all of its calamitous consequences. The new bill became law in Jan. 1942. It established the Office of Price Administration, gave added power to the price administrator and made his action legally enforceable through civil and criminal court action. He was given power to establish ceilings for any commodity and for housing rents in defense areas. Wages and salaries were wholly exempt from control under this bill, and certain limitations were placed on ceilings for agricultural products in line with the government's program for increasing agricultural production.

Ceilings on farm products were not allowed to fall below the highest of the four following items: (1) 110% of parity (parity being the relationship that existed between 1909 and 1914 between farm prices and the prices of things the farmers buy), (2) Oct. 1, 1941 price, (3) Dec. 15, 1941 price, (4) the 1919-29 average. The National City Bank of New York estimated that under this provision farm prices could increase from 10% on cotton to as much as 40% on corn. In addition to this limitation, no ceiling could be established on agricultural products without the approval of the secretary of agriculture. These provisions could have been enough to nullify the act, for as the farm prices rose to the specified ceiling, factory workers would have asked for a rise in pay to compensate for the rising cost of living. This in turn would have had to be reflected in price rises, which in turn would have raised parity and the farm price ceilings. But this did not happen, for both the price administrator and the secretary of agriculture were aware of the danger and acted to prevent excessive rises in farm prices in spite of any limitations in the act. They planned to sell government stocks of farm products acquired under the surplus buying programs of former years and to call farm loans if necessary. They also planned to set ceilings on hogs and cattle.

Operations under this new price control act continued approximately in the same form as under earlier executive orders with specific ceilings on individual commodities. Prices of staples advanced little during the first quarter of 1942, but finished goods, wage rates and the cost of living continued upward. Further limitations placed on the production of durable goods by the War Production board gave the inflationary tendencies new power.

When Canada adopted blanket ceilings on Dec. 1, 1941, authorities in the United States felt that such action would

be inappropriate for them to follow because of the greater population, the greater complexities of distribution and trade, and the attendant difficulties of enforcement. On the entry of the United States into World War II, however, the increased rise in the cost of living and the greater restrictions on the production of consumers goods led to the promulgation of the General Maximum Price regulation in May 1942. This placed ceilings on prices of most goods and on many services. The ceiling was the highest price charged in March 1942. This froze a rapidly changing economy to a rigid schedule of prices which were not in adjustment. Many inequalities were bound to arise from such a sweeping regulation, the only alternative to which would have been an astronomical number of price determinations. Retail prices normally lag behind wholesale prices during periods of change. At the time of the freeze many retail prices were not sufficiently higher than the replacement price to allow a normal margin for operating overhead. These maladjustments had to be ironed out over the succeeding months, and several devices were used to absorb the burden. In some instances where the line was an unimportant part of the retailer's business, he was forced to absorb the loss. In the majority of cases the prices of the wholesaler and of the manufacturer were "rolled back" to a point which made it possible for near normal margins to prevail at the various stages of distribution. Usually each level of the distribution system was forced to absorb a small part of the roll-back, but the manufacturer was forced to absorb the greatest part. Direct subsidies were not authorized at this time, possibly because they would only increase inflationary pressure by placing more money in circulation while holding prices back. In all adjustments one basic principle was kept in mind: the cost of living was to be held constant if at all possible. But when a roll-back was called for, some one firm or several individual firms had to bear the burden of the squeeze, go out of business or produce a different product. A difficult situation thus arose, in that lower-cost, lower-profit lines of products were dropped in favour of higher-margin items. This forced an unseen rise in the cost of living through enforcing a higher standard of living on the consumers of low-cost lines of products. Attempts to correct this situation through forcing production of low-cost lines met with little success.

With the blanket price control in effect, price could no longer be the regulator between demand and supply. Consumers had more money than ever before but little on which to spend it in the legitimate markets. In order to ensure a fair share for all, it was necessary to establish rationing of many commodities in May 1942. Foods, gasoline and fuel oil were the major commodities rationed at the consumer level; shoes, tires and many durable goods were also placed on the ration list. Many illegal operations, carrying on trade above price ceilings or without the use of ration currency, arose. The Office of Price Administration thus found itself with a sizable and difficult enforcement job. The effectiveness of the overall price control program could be measured approximately by the combined wholesale price index, which rose 20% in the year preceding price control and only 6% in the first year under such control.

In the first quarter of 1942, the two major labour unions of the United States began campaigning for wage increases. Their claim was based on the fact that the cost of living had risen, but that wages had not. They asked the president not to place ceilings on wages unless the nation

as a whole was completely controlled with special reference to drastic retail price controls, rationing, and higher taxes on profits. These demands conformed in general with the government's price stabilization program and, as seen above, price controls and rationing came along within a few months and higher corporate taxes followed soon. Nevertheless, in July 1942, these demands led to a general wage increase of 15% in the "little steel companies" to compensate for a 15% rise in the cost of living from Jan. 1, 1941, to May 1, 1942.

Since the total of available goods and services for civilian consumption was no larger, and possibly smaller, than it had been before the war, it was not possible for one group of the total population to have an increased standard of living without reducing that of others. In the labour unions' effort to maintain the same standard of living for their members they overlooked the fact that the total labour force had been increased, that many labourers were holding jobs in higher wage brackets than formerly, that most were now at steady work and that many were working overtime at premium rates. Thus a large proportion of individual labourers were receiving larger annual incomes (without any general rise in wage rates) and labour as a class was receiving a much larger money income than before the war.

The general raise in wage rates increased labour's purchasing power further.

If labour could establish its right to a peacetime standard of living, the price spiral would continue upward. Wage and salary stabilization was therefore adopted in Oct. 1942. Under these regulations, general wage increases could not be granted beyond the 15% established by the Little Steel formula. Individual increases were allowed for merit, to raise substandard wages, and if given in accord with an established pay raise scheme. Penalties on employers for violation were severe, extending as far as the disallowance for tax purposes not only of the illegal wage increment, but of the total paid to any worker receiving an illegal increment.

Gradual Rise.—The year 1942, with all its inflation pressures and controls, showed a rise in the combined wholesale price index from 93.6 in Dec. 1941 to 101.0 in Dec. 1942—a rise of 8% as compared with the rise of 16% in 1941. Farm prices at wholesale rose 20% from an index of 94.7 to 113.8. Food products increased in price almost as much, but all other commodities increased only 2%. The *Survey of Current Business* in Jan. 1943 summarized the 1942 price situation as follows: "In simplest terms it was a case of effective demand outrunning supply at previous lower price levels, forcing prices to move progressively higher throughout the year. The prime factors on the demand side were the record-breaking volume of government and industrial buying and the resultant heavy flow of purchasing power into consumers' hands. . . . The prime factor on the supply side was the growing relative scarcity of goods and services available to consumers. . . . Had consumers been free to dip into their record-breaking savings and bid prices up, and had sellers been free to hold goods for sale to the highest bidders, the cost of living might well have risen more nearly twice as much as it actually did during the year."

In 1943, the price structure held very well; the combined wholesale price index increased only 2% from 101 to 103.2, using December figures in each case. Farm products were up 10%, food products only 2%, and other products only 2%. During that year, prices crept up grad-

ually until about May—a climb which prompted President Roosevelt to issue his "hold-the-line" order on April 8. In this order he directed the appropriate authorities to fix price ceilings on all unceilinged commodities affecting the cost of living, to halt all increases in wages and salaries not provided for in the wage stabilization policy of Oct. 1942, and to prevent workers from shifting employment for higher pay. The price indexes held fairly steady throughout the rest of the year.

Toward the end of 1943, the official indexes, particularly the cost of living index, were challenged by numerous organizations as not being representative of the price increases. It was charged that they did not cover black market prices, quality deterioration and the necessity of buying better quality merchandise because low-cost lines had been discontinued. A group of independent statisticians reviewed the index at the request of the government and found that the index was fairly trustworthy with certain reservations. It was really an index of prices of things normally bought by consumers rather than an index of the cost of living and did not cover the increased standard of living forced upon consumers through the lack of low-cost merchandise. The reviewers also reserved their comment to apply only to moderate incomes in large cities. This reservation implied that, because of the limited number of observations used as a basis for the statistical procedure, the price index was not representative of conditions in smaller cities and for those with low or high incomes. Later the name of the index was changed from cost of living to consumers' price index.

One of the major developments in price control during 1943 was the substitution of dollar and cents ceilings on individual commodities instead of the maximums charged in March 1942. This eased the enforcement problem to a considerable degree in that it made the same ceiling on the same article at all stores of the same general type in the same city. Of course, differences had to be made for chain stores as against small independent stores, for large cities as distinguished from small communities, for places distant from the source of supply as compared with those near at hand. Thus the complexity of making price schedules fair to all was increased.

In order to bring adequate supplies into the market at existing ceiling prices, the subsidy payments begun in 1942 were extended during 1943. By October, payments were being made at the rate of over \$1,000,000,000 per annum. Seventy-three per cent of these were for foods and livestock feeds. Metals received 12% of the total, 9% was paid for transportation of petroleum products, and the rest was paid on several miscellaneous items. Several different agencies were responsible for determining policy and handling subsidy payments. They included the War Food administration, Office of Price Administration, Commodity Credit corporation, and Reconstruction Finance corporation—all government agencies. In addition, the War Labor board was in control of wage rate stabilization.

During 1944, the rise in the combined wholesale price index was very slight, only 1½%. Farm products rose 3%, but food products were held almost constant. The inflationary potential of earlier years was present in ever increasing force, but it was restrained both by government regulations and by the desire of most people to avoid a price rise. The main reason for the great stability during the year was the control over food prices; there was actually a slight decline late in the year caused by increasing supplies, improved functioning of price control, and the continuation of subsidies. Subsidies amounted to about \$1,300,000,000 during the year, and three-quarters of the

amount was spent on the butter, meat, wheat and dairy products sections of the industry.

In contrast to food prices, prices of household furnishings and clothing increased during 1943. The increase was more than was apparent in the published indexes because of the increased scarcity of low-cost items. Men's work clothes and children's wear were the most hard hit by this shortage. Attempts were made to correct the difficulty by allocating certain raw materials for the manufacture of these low-cost items only. The program was not comprehensive enough to be of much benefit.

During 1944, the productive machinery of the country was adequate to supply civilians with a comfortable standard of living (not allowing for depreciation and depletion of durable goods such as automobiles and washing machines) and to provide the materials of war. This made it possible for the price control and rationing programs to be effective. Nevertheless, the inflationary gap still existed, because money was being paid out to civilians for production of war materials, which were not available for their use. The total civilian income was greater than the value—at a stable price level—of the available goods and services. As a result (1) of the adequacy of civilian goods to meet needs (but not desires) and (2) of the effectiveness of price control, all of the consumer income was not spent; a substantial portion was saved.

Price controls continued, and the number of items transferred from the general maximum price regulation to dollars and cents ceilings increased, thus making easier the task of enforcement. Rationing also continued to relieve pressure on prices and to distribute scarce supplies more equitably than would have been possible otherwise. Easing of supplies made it possible to remove rationing controls from some meats and from canned vegetables for part of the year, but it was later necessary to restore them.

Victory in Europe and Asia in 1945 did not bring an end

Skeptical consumers feared "Cutting Loose" from price restrictions in 1946, despite the theory advanced that open competition was an adequate safety valve against inflation. Shoemaker's cartoon appeared in the *Chicago Daily News*

to the inflationary pressures on prices. Several years earlier it had appeared that at the end of the war all productive facilities would be turned to the production of civilian goods and that with a matching of pay rolls and available consumers' goods, the inflationary gap would be closed and the upward pressure would drop. This was not the case. With final victory there were many large cancellations in war production. It was necessary to maintain some in order to provide food and other necessities for the troops in the demobilization period and for those required for occupation of axis territory. There was also need for large shipments of supplies to the devastated countries. These were mostly in the form of food, but considerable quantities of machinery were sent in an effort to restore the countries to a basis of self-sufficiency as soon as possible. The magnitude of these requirements was, of course, nowhere near the requirements of total war. Another factor retarding the production of civilian goods was the necessity of reconverting the war plants into efficient machines for the production of consumers' goods. Though individual companies converted more rapidly than expected, the resulting overall production machine was not in balance. Production in many factories was curtailed because of the shortage of component parts and the unfavourable labour situation. This set a lower level on the supply side of the equation than had been expected. On the demand side there was the normal demand plus the deferred demand for the durable goods not produced during the war. The deferred demand was not merely desire, but desire backed up by willingness and ability to pay from the accumulated savings of wartime.

Postwar Controls.—In view of these circumstances, it was decided not to drop wartime price control upon the surrender of Germany and Japan. Prices of a few of the uncontrolled commodities such as cotton and rye advanced markedly after victory and indicated the temper of the underlying situation. Farm and residential urban real estate also rose markedly in price. Prices received by farmers rose gradually during the war months of the year and then weakened slightly, but the gain in November and December left the wholesale price index of farm products at 131.5 or 4% above the level prevailing in Dec. 1944. Foods rose 3% and all other commodities 1%. This combination of rises resulted in a net increase of 2% in the combined wholesale index, leaving it at a level of 107.1 in Dec. 1945, as compared to 75.0 in Aug. 1939, the month before the start of the war in Europe, and 98.7 in April 1942, the month before the promulgation of the general maximum price regulation.

The various subsidies were, in general, continued throughout the year. Some subsidies were removed, such as that on butter, and the ceiling price was raised by the amount of the cancelled subsidy. Gradually, during the latter part of 1945 and the early part of 1946, ceilings were removed from various products if they were not essential to the cost of living and if supply was becoming adequate to answer demand at but a small increase in price. Some of the more important commodities decontrolled were fish, white potatoes and automobile parts.

In addition to the ceiling and subsidy removals, there were also substantial upward revisions of ceilings in the postwar months of 1945 and in the first half of 1946. Under these revisions, the combined wholesale price index increased from 105.2 in Sept. 1945 to 112.9 in June 1946, about 7%. The prices of goods other than farm and food products had held fairly constant during the war with the

index showing a rise of only about five points. It stood at 99.8 in Sept. 1945 and was up to 105.6 in June 1946; this rise in a period of ten months was greater than the rise during the whole time the United States was at war. It was almost entirely accounted for by ceiling revisions made in an effort to stimulate production of strategic materials in short supply and to compensate for wage increases given in settlement of the large wave of strikes called in this ten-month period. Increases of \$5 a ton were granted for steel and 75 cents a ton for pig iron. The prices of finished products in this industry rose 11%, whereas the increase to this time had amounted to about 4% from Aug. 1939, just before war started in Europe. Similar increases were granted for copper, lead, brass and bronze products in May. The next month increases were granted for products made from these materials. Prices of building materials also advanced about 10% in these first postwar months. This was, in part, an effect of increases in metal prices. Lumber prices rose markedly as shown by the index of these products which rose from 155.0 to 176—14%. This placed the price of lumber in June 1946 about 90% above the Aug. 1939 level. Many of the increases in these industrial products were allowed in the hope that they would bring out materials needed to start the large new housing program.

Prices of cotton goods and clothing increased 16% from the end of the war to June 1946. The increase appeared at all levels in the cotton goods industry and was required by terms of the Stabilization Extension act of 1944, which specified that all cotton ceilings were to reflect parity to the grower. Prices of household furnishings, according to the official indexes, rose about 5%. Prices of household furnishings purchased by the consumer, however, rose much more rapidly because of the disappearance of low-cost goods and the substitution of new and better-grade products.

Farm and food products prices were far less stable in this immediate postwar period than were the prices of industrial products. They took a sharp dip at about the end of the war, partly because of a bountiful harvest. Later they rose about 10% into June 1946. Again, most of this increase represented ceiling adjustments and subsidy cessations. In meats a large part of the ceiling increase was permitted in order to cover the rise in labour costs of meat packers which resulted from the settlement of the strike early in 1946.

An important problem that had to be solved by the Office of Price Administration was the establishment of ceilings for products the manufacture of which had stopped during the war. A considerable group of manufacturers and businessmen contended that the abandonment of price controls on these products and on products which had been available in short supply would result in greater production, now stifled by distorted price relationships, and that prices would decline as adequate supplies became available. But this point of view was not accepted. As these products came back onto the market, the prices were subject to control and, in general, were set on the basis of the 1941 prices plus amounts to cover increases in basic material costs and wage rates that had occurred since that time. Profit was to be allowed equal to the percentage of profit on sales which had been earned in the 1936–39 base period.

Labour's Pressure.—With the end of the war there was a cessation of overtime and night shifts and a reduction in working hours for labour. Though not reducing the

straight time wage rates, it did reduce the amount of take-home pay. Downgrading of labour classifications was also important. In addition, the series of price rises discussed above increased the cost of living. This combination of factors brought about a period of labour demands for higher wages in the spring of 1946, supported in many cases by serious strikes. During the period a general pattern of settlement emerged. The previous policy of holding the price line and allowing only such wage increases as could be absorbed by the manufacturer did not meet labour's demands, and a new policy began to emerge in Oct. 1945. Conformity to a set pattern of wage increases was encouraged by requiring prior approval of the new wage rate by the National Wage Stabilization board if the wage increase was to be used as a basis for price relief. The criteria for wage increases were broadened to allow for correction of gross inequities both within an industry and between industries. Basic wage and salary rates were also used, in place of straight-time hourly earnings which did not include the effects of upgrading and premiums for overtime and night shift work. Under the new policy, wage increases of approximately 17% were granted in certain prominent cases such as steel and automobile production. The increases ran between 5% and 15% in the furniture, clothing and building material industries.

The pressure for price increases during the ten months from the end of the war to the end of June 1946 thus came from three sources: increases granted in prices of basic commodities, gradual elimination of subsidies, and the further time required to achieve balance in the demand-supply relationship. During this period the inflationary gap of the war years had been reduced to a considerable extent, but consumers' disposable income was running 70% above 1941, whereas production of consumers' goods was only about 40% higher. In addition to this inflationary factor there was less willingness on the part of individuals to save from current income and to maintain the large savings balances built up during the war period. It was difficult to continue to resist the purchase of the small supply of long unseen goods when it was generally feared that there would be more price advances. Consumers were being urged to exercise caution on the ground that soon the supply of goods reaching them would increase tremendously (1) as the inventories of merchants reached a normal level in relation to sales and (2) as reconversion problems including labour and parts shortages were resolved.

The price control act was scheduled to expire on June 30, 1946. For several months congress had been considering legislation to extend controls, but marked differences in philosophy were emerging. One school of thought felt that controls with the attendant unwise pricing, unrealistic regulation, and long delays in obtaining relief were hindering reconversion and fostering the black markets. Another felt that the tight controls of wartime should be continued. A compromise bill was passed and sent to President Truman for his signature late in June. In his opinion the bill was not sufficiently strong and in vetoing it just before the expiration of the existing act, he asked congress to extend the existing bill a few days until new legislation could be passed. Congress did not oblige, and price control in the United States expired June 30, 1946. It was not until July 25 that a new bill became law, extending price control until June 30, 1947.

During the four-week period of price decontrol, prices of foods and many industrial materials advanced, but certain stabilizing influences were felt at once. One factor was the unwillingness or inability of consumers to pay the inflated

prices. A second factor was the restraint of manufacturers and distributors, who feared a buyers' strike, and a strengthening demand for a strong price control bill; the manufacturers also desired to maintain good will and competitive positions, especially if price controls were reinstituted with the consequent reductions in price. Also important was a feeling of individual responsibility for helping maintain the economic system intact. The increased supplies brought to market by the prospect of better prices would ordinarily have been a stabilizing influence, but with the prospect of reconrol, the market was demoralized by an effort to reap the reward of high prices while possible and by an attempt on the part of consumers to buy while possible, regardless of prices.

During the first two weeks of this period the bureau of labour statistics index of 28 basic commodities compiled daily from spot quotations showed a 25% rise. After that, however, the index leveled off. The 25% rise was not as disastrous as it first appeared. The cessation of all subsidy payments at once had to be reflected by an increase in price. The end of the black markets, which some observers said were patronized by a substantial percent of the people, made an effective price reduction even though the official figures showed a rise. The *New York Journal of Commerce* made a survey and concluded that more than 60% of the increase in the 28 basic commodity prices was attributable to the elimination of subsidies and the ending of black markets. The bureau of labour statistics figure showing a 25% rise was also questioned because of its inclusion of a figure for raw silk, for which a normal market had not been maintained throughout the war. Because of the construction of this index, single isolated transactions in this commodity had a disproportionate effect.

Final Attempt at Control.—The passage of the new price control act was reluctantly received by many. It was generally felt that the cessation of price control inevitably would bring a marked adjustment in the economic situation. Now that the adjustment had been partially completed, two more adjustments were necessary: back to controls and eventually an adjustment to a free market. The new bill set up machinery for and expressed the intent that all price controls were to end with the expiration of the act June 30, 1947. The plan was for orderly decontrol throughout the year according to a schedule written into the law. The Price Decontrol board had authority to accelerate this program when the demand-supply relationship warranted. The decision to control prices on grains and animal products, cotton seed and soybeans, tobacco and petroleum and their products was deferred by law until Aug. 20.

Under the new act a three-man Price Decontrol board was established. This board had review powers in cases of dispute about specific ceilings and was responsible for deciding whether any decontrolled commodities should be placed under ceilings and what action should be taken with respect to subsidy payments. It was also given control over the decision to control or not to control various farm prices, which by terms of the act became eligible for reconrol on Aug. 20. The criteria for the decision to reconrol these or any other products were threefold: that the price had risen unreasonably since the expiration of the former act after making allowances for cessation of subsidies, that the supply was short and that regulation was practical and enforceable, and that such reconrol was in the public interest. The first major decision of this board was that livestock, meat and oilseeds were to be reconrolled but that grains, dairy products and other farm products were to remain free. The board had power to

order the reconrol of these products at any time such action was deemed necessary.

Another provision of the act required that all subsidies (reduced by the act to a level approximately half that of the preceding year) be eliminated by April 1, 1947, except subsidies on copper, lead and zinc, which might extend until June 30, 1947. In addition, the act specifically directed the president to recommend to congress legislation along monetary and fiscal lines which would aid in the control of prices before and after the termination of the price control act, in order to minimize the danger of inflation during and after the decontrol period.

Immediately after the act went into effect the ceilings of June 30, 1946, were reimposed in most cases not prohibited by law. Many were revised promptly. Some were in process of revision at the time of the expiration of the former act, and other revisions were made necessary by developments during the free period. New rules for ceilings on manufactured products were made in the act, presumably directed to the stimulation of production. One of the most important was the provision requiring ceilings on manufactured products to be equal to the base period price for the product plus a percentage adjustment based on average cost increase on the product to the industry as a whole. The base period was also changed from the 1936-39 average to 1940, thus providing larger profits and a greater stimulation to produce. Relief was likewise provided for distributors by allowing increases in their ceiling prices to compensate for increased prices from manufacturers instead of requiring distributors to absorb these increases as they were required to do under the regulations of the previous act. Wage stabilization controls were also maintained through the provision that price increases need not be allowed to compensate for unauthorized wage increases.

In the first three months after passage of the act it appeared that manufactured goods prices were rising to compensate for the increased costs and that production was continuing more smoothly. Labour, of course, had the opportunity to make new wage demands to compensate for the increased cost of living. Most of the strikes, serious though they were, were local in character. The only ones of broader proportions affected ocean shipping by tying up United States ports. These strikes did not directly affect the price of manufactured products.

With respect to food prices, the situation was quite different. Prices of certain farm products did not rise greatly. These were products in which bumper crops were expected. The reconrol of meat prices on Aug. 20, 1946, was accompanied by a drying up of the huge meat supplies brought to market in the "free" period. The shortage of these products diverted demand to dairy and other products with prices not subject to control. The latter price rises, in addition to a general public demand for dropping meat controls, led to a presidential directive on Oct. 14, decontrolling meat prices and accelerating the decontrol time schedule.

On Nov. 9, 1946, President Truman removed practically all remaining controls over prices and wages. He pointed out that a large proportion of the economy had already been freed of controls under the decontrol provisions of the new act, and that continuance of price control regulations would bring with it disadvantages of lack of balance in the economy more serious than any price increases likely if prices were free from controls. Since most farm products had already been freed, price changes in these as

a result of the presidential order were minor. The major changes occurred among certain basic industrial commodities and manufactured products. Many of the industrial raw materials showed marked increases in prices, but the price quotations were not wholly accurate because of the partial elimination of the practice of upgrading which had been carried on under OPA regulations. These price increases were expected to work their way through to manufactured products, but for the remaining two months of 1946 manufacturers were trying to maintain their former prices. There were some notable exceptions, especially when in one day General Motors corporation announced a flat \$100 increase in the price of their automobiles and General Electric company announced an increase in the price of their products averaging 30%.

The work stoppage in the bituminous coal mines from Nov. 20 to Dec. 7, 1946, added to the inflationary tendencies by retarding the availability of still scarce goods. However, the remaining three weeks of the year did not allow sufficient time to show clearly the effects of this strike on prices.

At the end of the year only residential rents, rice, sugar and sugar syrups remained under price ceilings. Sugar and rice controls were expected to be removed later, but the need for continued, but possibly revised, ceilings on rents was generally recognized. Transfer of the rent controls to state administration was under consideration.

Great Britain and the Commonwealth.—The ten years ending in 1946 witnessed a marked rise in prices throughout the countries of the British commonwealth. The financing of World War II, as that of World War I, was bound to produce an all-round upswing which was strongly accentuated by the scarcity of the supply of goods and of labour. The degree to which these factors affected the price levels in various countries varied widely, according to the circumstances of the countries concerned.

The last two prewar years showed remarkably conflicting trends. The business recession which developed in 1937 caused wholesale prices to fall, in spite of the growing demand for rearmament requirements. On the other hand, the cost of living in many countries continued to rise; at best, it remained more or less stationary. The explanation lay in the time-lag usually elapsing between changes in the trend of wholesale prices and of the cost of living.

Before the cost of living could begin to reflect receding wholesale prices, the latter resumed their upward movement, as a result of the war. Practically everywhere, there was a constant rise in wholesale prices and in the cost of living. Even after the termination of the hostilities, prices within the countries of the British commonwealth continued to move upward.

The fairly marked drop in wholesale prices in the United Kingdom before the war was followed by a rise which, by 1946, had lifted them about 74% above prewar level. Of this rise, the first 20% may be accounted for by the devaluation of the pound at the beginning of the war, so that the rise in terms of gold or dollars was only slightly

Index of wholesale prices for France, the Netherlands and Czechoslovakia, 1939-46. (Jan.-June 1939=100)

over 50%. The cost of living was kept down with the aid of price control and subsidies, so that in 1946 it was only 32% above its prewar level. Allowing for the devaluation, the rise in real terms was only 12%.

Some of the countries of the British commonwealth were even more successful in keeping their prices down after 1939. In Canada, wholesale prices rose only by 41%, and the cost of living by 19%. The rise was 39% and 23% respectively for Australia and 58% and 32% respectively for South Africa. The currencies of the last two countries had been devalued by 20% in line with the pound sterling, so that in terms of dollars the rise in their price levels was very moderate indeed.

In India, on the other hand, the increase in price levels was far more pronounced. Considerable inflation of purchasing power developed on account of difficulties in raising adequate amounts for war finance.

Continental Europe.—On the European continent the rise in prices was much more extensive than in Great Britain. Some countries, even though neutral, were less successful in checking this upward trend. In Switzerland, for instance, wholesale prices more than doubled, and the cost of living rose by 58%. The rise was even more pronounced in Spain, but was more moderate in Sweden. Wholesale prices in Portugal rose by about 150%.

Some of the countries that came under German occupation succeeded reasonably well in keeping down prices. In this category were Denmark, Norway and the Netherlands, where the rise was not more pronounced than in neutral countries despite the heavy occupation costs imposed on them and the inflationary effect of various German methods of economic exploitation. On the other hand, they had very little military expenditure, while in neutral countries the necessity of maintaining substantial defense forces combined with purchases by belligerent countries had a cumulative effect on the price level. The rise in wholesale prices was 72% in Holland, 82% in Norway and 94% in Denmark.

France, on the other hand, experienced a much greater price inflation during the war, and especially after the war. While the Low Countries and the Scandinavian countries succeeded in bringing their prices under control soon after liberation, internal political and social conditions in France made it difficult for the government to check the rise. The necessity of devaluing the franc, and the anticipation of a further devaluation acted as contributory factors. The official price index could not adequately reflect the full extent of the rise, as a very large proportion of commodity and other commercial transactions took place in the black markets (*q.v.*), where prices were much higher.

Among the liberated countries, Greece suffered worst. A runaway inflation developed which sent prices to astronomical figures, surpassing even those of the German inflation of 1923. Although the currency was drastically devalued in 1944, an attempt at stabilizing prices was not very successful. The following two years were marked by further considerable inflation.

The axis countries also experienced substantial price increases, especially after their defeat. In Germany prices had been kept well under control during the war, but with discipline relaxing after the collapse, a sharp upward movement occurred, the extent of which varied in the different zones of occupation. In any case, officially quoted prices ceased to have any meaning. Trade in articles other than rationed goods was confined to the black market and to barter transactions. In Italy, the rise in prices was relatively moderate until 1943, but after the surrender, under the combined effect of Allied and German occupation and of the defeat, a very sharp rise occurred which continued even after the Italian authorities had taken full charge and had checked the issue of paper money. Among the satellite states, Hungary experienced wild inflation similar to that of Greece. Thus, in June 1946, the cost of living index had reached 166,000,000,000,000,000% of the average of Jan.-June 1939. In Rumania, too, prices rose very sharply. On the other hand, Finland and Bulgaria succeeded in keeping their prices in check to a reasonable degree. (See also AGRICULTURE; BUSINESS REVIEW; CONSUMER CREDIT;

Prince Edward Island

Nestling in the Gulf of St. Lawrence in the curve provided by the eastern shore of New Brunswick and the northern shore of Nova Scotia, and separated from them by Northumberland strait, Prince Edward Island is the smallest Canadian province, with an area of only 2,184 sq.mi. It entered the confederation in 1873.

The 137-mi.-long island is the most densely populated province, though it has the fewest people. In 1941 there were 43.5 persons to the sq.mi., and since 71% were on the land it was Canada's most compact farming community. However, wartime enlistments and the lure of high-paying industrial jobs in Ontario caused a sharp population decline after 1941. In 1946, with 4,000 uninhabited homes, mostly rural, it was the only province not suffering from a housing shortage. The population figures were: (1931) 88,040; (1941) 95,047; (1946 estimate of dominion bureau of statistics) 92,000. Centres of population in 1941 were: Charlottetown, the capital, 14,821; Summerside, 5,034; Souris, 1,114.

There were no other towns with populations of more than 1,000.

Racially, 80% of the 1941 population was British and 16% was French. Persons of Dutch ancestry were the next largest group. About 42% of the people were Roman Catholics, 28% belonged to the United Church of Canada, 18% were Presbyterians, 6% Anglican.

Lieutenant governors for the 1937-46 decade were G. des Brisay DeBlois (Dec. 28, 1933-Oct. 1, 1939) and Bradford W. LePage (after Oct. 2, 1939). Premiers were Thane A. Campbell (Jan. 14, 1936-May 11, 1943) and J. Walter Jones (after May 11, 1943).

Except for the drop in population, and the large increase in productivity—from \$19,000,000 in 1935 to \$32,000,000 in 1944—because of World War II, little of a spectacular nature occurred on the island during the 1937-46 decade. The Liberals remained in power, winning all the 30 legislative seats in 1935, 27 of them in 1939 and 20 in 1943.

Like other governments, the Prince Edward Island administration took steps towards the end of the war to secure the provincial economy for the postwar period. To promote and co-ordinate plans for employment, a Department of Reconstruction was established in 1944. In the same year an agricultural survey was

undertaken, and an Advisory Reconstruction committee was appointed to organize work projects on education, tourist and transportation, rural electrification, housing, finance and revenue, fisheries, agriculture, public health and welfare and forestry. In 1945 the government enacted measures relating to town planning and electric power supply. During 1946 the per capita rate of return-to-the-land veterans was so high that the island government's technique was studied by the other Canadian provinces.

The most dramatic incident of World War II on the island was the torpedoing by a nazi submarine of one of its railway car ferries, chief link to the mainland. Only one ferry was left in operation, and it was inadequate for handling export-import freight. New and more powerful ferries were designed, one of which was put in operation in 1946; but its engineers made an error and the boat was unable to use the island terminal at low tide. Another ice-breaking ferry was nearly ready for service by the end of 1946, and that year the federal government spent \$5,000,000 to extend the Cape Tormentine and the Borden terminal piers, to reduce ice hazards further. There was much talk of a causeway or tunnel to the island, in order to give it the transportation services promised when it entered the confederation, but nothing was done. Air service, however, was established during the early part of the decade, and was of prime importance by 1946.

By 1946, also, tourism was considered the island's third great industry; an increasing number of vacationers appreciated the cool summer climate and the almost unbroken fringe of excellent bathing beaches that circle the island. The government's program to maintain and increase this tourist interest included widespread publicity.

In 1945 the island was used as the test province for the federal government's family allowances, and the experience gained through the advance registration of children on the island enabled the registration elsewhere to go smoothly.

During the decade, Prince Edward Island was much embarrassed by lack of provincial revenues. Unlike other provinces, the island did not have large blocks of public

lands, rich natural resources in mine or forest nor taxable big corporations. Thus, many of the social services common to other parts of Canada were not available to islanders. The government was active in trying to increase the provincial subsidy received from the dominion government.

Despite the increase in per capita national income from \$185 in 1939 to \$385 in 1944, the province was still at the bottom of the list in this regard. It was also at the bottom of the list in the number of radios and telephones per hundred persons. (C. Cy.)

Printing

Aside from the invention of such important machines as the linotype and monotype and the basic principle of offset printing, the decade 1937–46 saw more new developments than in the preceding five decades. Methods improved and standard machines were speeded up. Furthermore, there were indications of a trend toward a quite different technique with science, including chemistry and electronics, playing a progressively larger part.

Paper, rollers and ink are as essential to printing as presses, and despite the years of World War II when paper and ink quality—the former, particularly—deteriorated for lack of essential materials, there were advances in development of improved finish, better surfacing methods, waterproofing, scuff-proofing, receptivity to ink, writing quality, and so on.

Developments in the quick drying of ink to keep pace with increases in press speeds marked the era. Following heat-set and cold-set inks, so-called water-set inks were developed during 1941. Applied as a vapour, either as a spray or in the form of steam, water causes ink to set quickly and prevents excess penetration, the latter making the method especially adapted to containers and cartons. Most widely employed was the heat-set method, which permits practically instantaneous drying of inks, the ink vehicle being vapourized by the application of heat, leaving a relatively dry ink film on the surface of the paper.

Another contribution of a scientific nature was the use of several rubber-like materials to supplement composition and rubber press-inking rollers. These possess strong wearing qualities as well as resistance to vehicles used in inks and solutions for washing rollers.

Letterpress advanced during 1941 through the development of facilities for making original etched plates curved to fit the press. For rotary relief printing it had been necessary to make flat original plates and from these cast electrotypes or stereotypes (duplicates) in the required curved form. The new invention obviated the need for the duplicate plates in many instances.

In the step and repeat process, offset had long had an individual efficient method of putting down on one press plate—to micrometer exactness for position and register—the number of pages or designs required for capacity of press or sheet to be printed. In the time required for preparation before starting a press, relief printing was at a distinct disadvantage since forms had to be made up from separate units, register being finally achieved by trial and error. Equipment providing the single plate of multiple pages or items exactly spaced as in offset also came to letterpress in 1941.

Several highly advantageous applications of plastics were

made to printing; the most extensive was in producing duplicate plates from moulds of photoengraved line and halftone engravings. Such plates were not only made of plastic but moulded from mats of that material, modified. Big advantages were simplicity of making, comparative low cost and light weight (one-eighth that of an electrotpe). Moulds of plastic were increasingly used for making standard duplicate plates by electrodeposition of copper. Silver, rather than black lead used for customary moulds, was the conductor. The silver, incidentally, eliminated dirt accompanying black lead. A lead mould permitted of but one face shell for electrotypes whereas plastic moulds could be used repeatedly.

A pioneer manufacturer of plastic material announced that single types had been cast for setting large display lines from nylon. A slug (line of type in one piece) was cast from plastic material with a standard line-casting machine. While the experimenter admitted the job was difficult and time-consuming, and the printing surface was imperfect, the cast was made. Use of the material for etching original plates and for moulding curved duplicates had not as yet been accomplished.

An important development of the decade was a composition plastic and processed paper press plate for offset printing. Flexible, it was composed of equal parts of paper and plastic, the latter forming the printing surface, the paper flexibility. Cost was materially less than that of zinc and aluminum, heretofore used for offset plates. A government printing office executive reported a run of 100,000 from such a plate.

The industry harnessed the science of electronics for important uses. One application was to drives on large newspaper and magazine presses. Use of the electronic Luxometer eliminated inaccurate measurement of exposure time. It automatically measured time required in lumens, units of light intensity. It not only gauged and supplied the correct amount of light required for the subject but insured correct tone and colour values.

A press functioning upon an entirely new principle—and the invention of a respected technician—was being built in Chicago, Ill. It was not only adaptable to all major printing methods—relief, planographic and intaglio (letterpress, offset and gravure)—but, to mention the new principle which suggested the term “pressureless” printing, printing without contact between the plate and paper, ink with a metallic content “jumping” from inked plates to paper through electromatic or electrostatic forces exerted by the electronic tube. Because presses could be built lighter in relation to form and run more freely since cylinders do not grind against each other, speed seemed limited only by the speed at which the cylinders could be made to revolve.

Photoelectric colour register control was applied in a number of plants. A pioneering step in colour gravure printing was undertaken in the application of photoelectric equipment to register automatically three colours on one side of a web of paper and four on the opposite side, with the paper running through the press at the rate of approximately 1,200 ft. a minute.

One of the most dramatic graphic arts development of the decade was that of the *Chicago Tribune* in publishing a full-page, full colour illustration of “The Big Three” (Truman, Attlee and Stalin) meeting at Potsdam, Germany. Colour separations for making the plates were sent by radio. The manner of transmission was equivalent to that of sending black and white pictures (or other copy)

638 by facsimile. The colour photograph, placed on a revolving cylindrical drum, was scanned by the magic photo-electric eye in connection with red, green and yellow filters. Filtering was made possible by the ratio between the speed of the drum and colour wheel. The picture came to the receiver as three different negatives to be combined for three-colour prints or employed as separation negatives for process colour plates.

Automatic production of photoengravings was forecast at the end of the decade. One of the developments was a device for mechano-scientific "tooling" rather than etching so-called halftone plates. Essentially the mechanism had two parts, (1) the electric eye (scanner) and (2) a v-shaped cutting tool. Where a photograph was light as scanned, more power was applied to the cutting tool and ridges of the parallel grooves became thin. Conversely, where copy was dark proportionately, less power was applied and the ridge was thicker. When finally the whole picture was covered, the combination of the printing ridges (80 to an inch) produced the varying tone values of the photograph in a printing plate.

Infra-red, another magic of science, was also applied to printing. The first use was for drying printed sheets coming off a press. Extensive uses of the infra-red rays were burning in top enamel on photoengraved plates and baking albumin on offset plates. The infra-red oven supplanted hand methods, and did the work both better and faster.

The rapid growth of offset led many to believe that photography would play a much greater part in printing.

Development in colour photography proceeded at a rapid rate, and colour film permitting studio—even home—development was marketed. The Kodak Fluorescent process, developed in 1942, improved on the method of reproducing full-colour illustrations and speeded up the making of plates. Pictures are painted with water colours which fluoresce in ultra-violet light. This fluorescence so improves the red and yellow that colour correction is practically perfect. Although invisible in ordinary light, the bright fluorescence, which fully effects red and yellow colour correction, makes a striking display in a darkened place under strong ultra-violet rays. Photography for blue and black plates is accomplished, however, with white light only falling on copy. Another outstanding contribution to the betterment of printing (lithography) was a contact screen of Eastman Kodak company. For fidelity it was said to be the nearest approach to continuous tone reproduction—that is, most like a real photograph.

The remarkable Iriscope translates black and white photoprints taken with an uncorrected lens back to the original colours. This is possible because each ray of colour forms a pattern at precisely the same depth in the film every time. When a positive is made, using the filter, the picture appears in the original colours.

Further development of microprinting was in progress. Microprinting held the possibility of a profound influence upon the industry, and a reduction in the volume of regulation book printing. Through it the text of a book may require only the back of a library file card or a 6- by 9-inch sheet attached to it on which, with face and back micro-printed, as many as 200 pages may be provided. The method saves binding, labelling, shelving and storage space. It was said to be superior to film which must be projected for reading.

Brought into use just prior to World War II were cameras providing lettering for display printing which previously required the services of expert artists. The so-called

photo-lettering machine composes photographic images of individual letters and designs into words or patterns upon the film, paper or dry plates. It permits condensing, expanding, reducing or enlarging the lettering (or other copy) in one direction only. Lettering with a back slant as well as the usual slant to the right is accomplished.

What was believed to be the first machine for photo-composition of type matter in actual production was being tested in the government printing office. The basis is the standard line-casting machine. Mats are assembled and sent along as if to cast a line in metal. Then the operation becomes quite different. Instead of being engraved and on the narrow side of the mat, the character is in transparent form set into the mat on the wide flat side. When the row of mats is brought in front of the camera section, the mats, one at a time, are caused to move to aperture and are photographed. The row of mats is justified in the first place with usual spacebands between words. There is mechanical provision for allotting to single letters the exact space each individual letter requires in the line, when finally complete on the film, as in the row of mats. After exposure of one line, the spool of film is caused to move whatever space is desired for the following line, et cetera. In the end, a negative for the type matter of book page or newspaper column is obtained. Photocomposition would be a boon to offset and gravure printers, obtaining negatives at one operation, instead of setting the type and taking most careful proofs to be used as copy for making negatives with a camera.

Great Britain.—During World War II the printing industry in Great Britain was not able to consolidate the steady technical progress of the immediately preceding years. Nearly half of the industry's labour force, male and female, entered the armed forces or were transferred to munitions, aircraft or other war production. All paper supplies were strictly controlled, and the industry suffered

from the acute shortage of both manpower and materials. Readability of printed matter was reduced by the use of smaller sizes of type on inferior paper stocks, and artistic presentation suffered further by restriction of paper margins. The use of colour was also limited as sheets were allowed to pass only twice through the machine, and printing inks seriously deteriorated as a result of lack of suitable raw materials.

Practically all supplies became short and inferior in quality; repairs to machinery were carried out with very great difficulty and as priority work. Extensive destruction was caused to machinery of the printing and allied industries in the air attacks on the large cities of the country. Many printing factories were destroyed or severely damaged in London, Liverpool, Manchester, Birmingham, Bristol, Coventry and many other cities and towns. Book production was unable to keep pace with an increasing demand from the public, and 1946 found book printers, and especially binders, seriously in arrears with orders. Owing to shortage of paper, poster production was limited commercially, although some excellent work was done for the government, almost exclusively lithographic.

The most spectacular development during the war was the adoption of mobile and semimobile printing units for the military services. Letterpress printing units were used on a small scale, having both hand and mechanical typesetting, but far wider use was made of lithographic units, chiefly for the printing of maps. Compact equipment of the most up-to-date type was used and transported in special trucks to the vicinity of military operations. The units were self-contained and were able to prepare copy, make photographic plates, produce printing plates and print on automatically fed lithographic offset machines. In Britain the most up-to-date gravure plants did work which was notable rather for speed of production than for the higher quality of production for which they were designed. Work was primarily for direct war purposes; magazines were produced for the forces, and huge outputs of propaganda literature were produced and released from planes or projected over axis territory almost before the ink was dry. Wide development was noted in autolithography both for children's books and for coloured book illustration.

France.—During the German occupation of France, paper was extremely scarce and of low grade. With the return to settled conditions there was hope of great progress in metal decoration by lithography. The success of the Letouzey process for the reduction or elimination of makeready on the letterpress machine for bookwork caused universal interest.

Germany.—In the years before World War II much printing was exported from Germany, not because of its excellence but because of subsidies. On the other hand, there was a fairly regular flow of reproduction work which reached a very high standard of quality. Notable in this class were the exquisite collotype reproductions of master artists, distributed throughout the world. The best photogravure productions in two, three and four printings set a standard difficult to equal. Much photolithographic reproduction in four, five and six printings was particularly well done, and the type of copy most widely used was the natural colour photograph of the Duxochrom variety. These colour photographs were produced on a generous scale throughout the war and their reproduction continued during the occupation, particularly in the Russian zone. In all these cases the best work was produced by a small number of specialist firms. Four-colour litho reproduction for books was also well done. Another technique was the

use of multicolour reel-fed gravure machines for full colour insets, magazines and advertising matter, both sides of the web being printed simultaneously in some cases. At the end of 1946 much of this specialized machinery lay buried among demolished buildings, and its salvage depended on permission from the occupying powers. Mobile printing units for use with the German military forces were used on a negligible scale, a remarkable exception being a train fully equipped for the production of newspapers.

Netherlands.—Dutch printing reached a standard not generally appreciated outside the country's own borders. The three main processes were used progressively. Although subjected to German domination during the greater part of the war, the Dutch printing industry quickly rehabilitated itself after liberation, and as a result of war dislocation of the printing industry in England and postwar labour difficulties, a fair amount of book printing for British publishers was being produced in the Netherlands toward the end of 1946.

Switzerland.—Although Switzerland was not directly engaged in World War II, it suffered considerably from lack of trade; its usual imports of supplies and raw materials were seriously restricted. The quality of printing was generally high in Switzerland, and magazine production was developed with wide use of colour both by letterpress and gravure processes. Before 1937 Switzerland had introduced more intensive study of the graphic arts into technical schools, and this later had a healthy effect on book production and illustration. After 1940 a progressive and considerable rise took place in book production in German, French, Italian and English. Many cultural books were printed for France during the war. The progress of lithography was well represented by a 356-page book published in 1944 entitled *Die Lithographie in der Schweiz und die verwandten Techniken, 1894-1944*. In no other country in the world was the screenless lithographic photochrome process used to the same extent or developed to the same excellence as in Switzerland. (See also BOOK PUBLISHING.) (A. Kk.)

Printing Office, U.S. Government

The U.S. government printing office, located in Washington, D.C., is generally recognized as the largest and most complete printing plant in the world. In 1946 it occupied three eight-story office buildings and a four-story warehouse, aggregating 33 ac. of floor space. It contained complete typesetting, proofreading, press and bindery divisions; a foundry for casting stereotype plates; a platemaking division for half tones and line cuts, as well as plastic and rubber printing plates; machine shop, carpenter shop, paint shop, etc.; a maintenance division for the care and upkeep of buildings and equipment; and its own guard force, trusted with protection of the \$16,233,117 plant and its product.

The printing office is administered by the public printer, appointed by the president of the United States by and with the advice and consent of the senate. According to law, the public printer "must be a practical printer and versed in the art of bookbinding," and must be required to give bond in the sum of \$25,000 "for the faithful performance of the duties of his office." His salary was fixed at \$10,000 a year.

The Public Printing and Documents law required: "All printing, binding, and blank-book work for Congress, the Executive Office, the judiciary, and every executive depart-

ment, independent office, and establishment of the Government shall be done at the Government Printing Office, except such classes of work as shall be deemed by the Joint Committee on Printing to be urgent or necessary to have done elsewhere. . . ." It also stated that printing, binding and blankbook work which the public printer is not able or equipped to do may be procured elsewhere under contracts made by him.

The government printing office was authorized by act of congress on June 23, 1860, and opened for business on March 23, 1861. The original building and equipment were purchased intact from a private printer who had established a large plant in 1856 in the hope of being commissioned to perform the public printing. As the printer to each house of congress was elected annually by the members of that house, no printer could depend on the work from year to year. In 1861, the new government printing office employed 300 men and women as compositors, pressmen, bookbinders and labourers, with wages for craftsmen set at \$14 a week. In 1867, the government's total printing bill was \$1,631,000, divided as follows: executive departments, \$757,000; house of representatives, \$455,000; senate, \$186,000; miscellaneous, \$233,000.

As the government grew and became more complex, the volume of public printing increased and the printing office expanded to carry the load. Printing became more than ever an essential element of national legislation. The information furnished in printed documents was indispensable to legislators framing bills and drawing up reports. On June 30, 1937, 5,594 employees were on the payroll of the office, and the total dollar value of their product was \$18,163,977.24.

Although additional buildings, one in 1900 and one in 1928, had been added to the original office (which was built in 1856), lack of floor and storage space was a severe handicap in handling the ever-increasing volume of work. In 1936, congress authorized the erection of a warehouse building and a new office to replace the original structure. The warehouse was completed in 1938 and the office building in 1941 (though parts of it were occupied late in 1940). Obsolete and worn-out equipment was replaced by efficient, modern machines, some of which were built to order to handle types of work peculiar to the government.

* * *

THE ONSET of the emergency of World War II made itself felt in government printing in the 1940 fiscal year. It found the printing office in better condition to meet additional demands than it had ever been before. During the 1941 fiscal year, however, it became evident that it would be impossible to produce all necessary public printing in the office, with the plant, equipment and personnel then available. The public printer decided that it would be to the long-term interest of the government to procure surplus printing, under contract, from commercial publishers rather than to expand the government plant beyond reasonable peacetime needs. By 1942, procedure for commercial purchase of surplus government printing was well established, and for the first time since 1860 private printers were producing general government printing office work under contract.

Demands for printed matter continued to increase as the United States rapidly swung into its all-out war effort. In the five years 1941-45, inclusive, the total value of public printing showed an increase of 223.8% over the period

of World War I (1916-20, inclusive). From \$18,000,000 in 1937 the total grew to \$78,000,000 in 1943. Machinery for commercial purchase established early in the war proved inadequate for the volume which had to be bought. Paper and other printing supplies became increasingly scarce and difficult to procure. Transportation facilities were jammed and near the point of collapse. It was essential to bring more and more printers in all parts of the country into the government program in order to obtain the needed volume. It was also necessary to produce printed matter near its distribution point to relieve overburdened transportation systems. At the same time, it was obligatory that all printing be produced under close supervision of the government printing office in order to protect the public interest. To accomplish these ends, the public printer established warehouses in New York city, Chicago, San Francisco, Dallas and Atlanta, and offices in Philadelphia and St. Louis. These warehouses were staffed with qualified printing technicians, under whose supervision contracts were let, paper was stocked and delivered as needed and delivery of finished work was made. Operation of the warehouses marked the first decentralization of government printing in history. Without these branch offices it would have been impossible for the public printer to furnish the huge quantities of books, pamphlets, forms, etc. needed to carry on the war. The warehouses, however, had been merely a temporary expedient to assist in doing a job that had to be done. They were closed as soon as the emergency was over.

On July 1, 1946, the government printing office was further expanded when it absorbed 15 field reproduction (offset) plants, previously operated by the procurement division of the treasury department, in Philadelphia, New York city, Boston, Chicago, Cincinnati, Cleveland, Kansas City, Denver, Seattle, San Francisco, Los Angeles, Fort Worth, Dallas, Atlanta and Washington, D.C. Employees of these government plants, engaged exclusively in producing public printing, were appointed under the civil service system, like the employees in the government printing office in Washington. Even after the successful conclusion of World War II, printing demands remained so heavy that it appeared in the best interest of the government to retain the field establishments but to consolidate them with the Washington printing office for greater efficiency and economy of management.

During the 10-year period 1937-46 inclusive, the government printing office produced 108,078,053,121 copies of finished work, ranging from simple forms to large bound volumes, valued at \$376,534,249.16. Appropriations in the amount of \$37,365,000 were made to the office to cover the cost of work for congress. All printing except congressional documents was sold to governmental departments and agencies and paid for out of funds appropriated to them specifically and exclusively for printing and binding. Work was billed to the departments at cost, including overhead. If any surplus remained at the end of the year through sales receipts in excess of actual production costs of the publications, it was turned in to the treasury.

In addition to manufacturing public documents, the government printing office also sells and distributes them. The superintendent of documents, an official of the office, is authorized by law to sell at cost to the public any document whose distribution is not otherwise specifically directed. He may order to be printed a quantity of any official publication which may, in his opinion, have a sales value. As the ordering department has already met the preparatory charges, the superintendent of documents pays only for presswork, paper and binding. His sales price rep-

resents this cost, plus 50% for handling. Under this arrangement he carried on a public sale business of \$2,180,476 in the 1945 fiscal year, selling 37,085,361 copies of documents. This business provided a profit of \$1,300,483, which was returned to the treasury. The documents division is also designated by law as the distributing officer for both departmental and congressional publications.

Prisoners of War

World War II provided the first test of an internationally-agreed-upon code for the treatment of prisoners of war. In 1929, 47 governments assembled at Geneva, Switzerland, at the call of the Swiss government, signed an agreement entitled, "Convention of July 27, 1929, Relative to the Treatment of Prisoners of War," the first codification of international law concerned solely with the treatment of prisoners of war. The necessity for such a convention had been demonstrated during World War I, when bilateral and multilateral agreements had to be worked out among the belligerents in the course of hostilities. So difficult and time-consuming were negotiations under such conditions that the agreement between Germany and the United States for the treatment of prisoners of war during World War I was not ratified until a few hours before the Armistice.

In general, the 1929 convention provided minimum standards for the treatment of prisoners of war. Food was to be equal to that of troops of the detaining power at base camps. Sanitary and medical facilities were to be provided. Prisoners might be held in compounds but not individually confined except under unusual circumstances. Officers received pay, generally on the same scale as officers of corresponding rank in the army of the detaining power. Prisoners other than officers might be required to work with pay at an agreed-upon rate, but the work could have no direct relation with war operations. Representatives of the protecting power might visit camps. Facilities for the exchange of correspondence with relatives at home were to be provided, and prisoners were allowed to receive parcels. Such correspondence and parcels were exempt from all postage and customs duties. The convention further provided for the exchange of information about prisoners through bureaus in each of the belligerent countries and a central information bureau.

The 1929 convention was subsequently ratified by 36 of the signatory nations, among them the following major belligerents in World War II: China, France, Germany, Great Britain and the United States. Although representatives of Japan had signed the convention, the Japanese government failed to ratify it. In Jan. 1942, Japan agreed to abide by the terms of the 1929 convention, qualifying that statement by the expression, *mutatis mutandis*, but this action was not formal ratification. The nations not signatory to the convention were given an opportunity to adhere to it, and six of them subsequently announced their adherence. The U.S.S.R. did not participate in the 1929 meeting at which the convention was signed and did not subsequently adhere to it. Following the outbreak of hostilities with Germany in 1941, the soviet union stated that it would apply the terms of the Hague convention of 1907, which had no provision for neutral observation of prison camps, the current exchange of names of prisoners or for correspondence with prisoners.

Treatment of Prisoners in World War II.—In general,

the treatment accorded to recognized prisoners of war in permanent camps during World War II was considered to have been superior to the treatment of prisoners in World War I. In some cases they were reported to have fared better than the civilian population of the holding nation. Reports of neutral delegates of the protecting powers and of the International Red Cross committee which visited such recognized camps in nearly all belligerent countries indicated that the detaining powers were endeavouring to observe the terms of the prisoners of war convention.

There were incidents of abuse of prisoners of war and of failure to provide the facilities required by the convention, usually occurring in the period immediately following capture and while in the custody of combat troops. Facilities for adequately handling large numbers of prisoners were usually nonexistent in forward areas. In general, however, after establishment in regular prisoners of war camps remote from the front, prisoners held by countries bound by the convention were not mistreated. Standards of care varied with the customs of the detaining powers, local conditions and supply shortages in the country of detention.

Lack of transportation from the fighting areas to permanent camps was a cause of occasional brutality. The "death march" to the camp at Tarlac of U.S. prisoners captured at Bataan and Corregidor in April 1942 was one of the worst examples of mistreatment during the war. In weakened condition after the long fight, without adequate food or medicine, the men were marched 80 mi. without food, water or medical attention. Forced marches also occurred in Europe as the Allied forces advanced into Germany from both the east and the west. In an effort to retain the prisoners, camps were hurriedly moved by the Germans. Because of lack of transport, the men made the moves on foot. Many of the transfers were made in winter weather with scanty food supplies. One group from Stalag 64 in Poland marched westward 400 mi. before liberation. The marching columns were, however, frequently met by trucks operated by the International Red Cross committee, and food parcels and other supplies were distributed to the men en route.

British and U.S. prisoners held by Germany fared better than did those of other Allied nations in German camps. The terms of the convention were more strictly observed in their behalf, and in addition they received regularly food parcels, clothing, medical supplies and recreational, educational and religious articles from home. Evidence of satisfactory treatment was confirmed in 1945 after the liberation of U.S. prisoners in Germany when, aside from normal mortality, 98% of the captured U.S. military personnel were taken home.

No information was available from the soviet union regarding axis prisoners held by that country, but axis prisoners held by the other Allies were satisfactorily treated. Most of those captured by the various forces of the British empire were held in Canada. The United States transferred to its continental territory the majority of the prisoners taken by U.S. forces. Neutral observers reported excellent conditions for these prisoners. Such supplementary relief supplies as were directed to them from home were distributed to the prisoners under the supervision of delegates of the International Red Cross committee. Civilian groups in both Canada and the United States occasionally objected to the high standard of treatment given the prisoners. Similar objections by civilian

groups were reported to have occurred in Germany and Japan.

Numbers.—Over-all statistics on the number of prisoners held during World War II were difficult to obtain or verify. The U.S.S.R. did not report its captives. In retaliation, Germany furnished no information concerning soviet prisoners. Japan reported only a small number of those known to be held. Persons originally classified as prisoners of war were later given some other status; for example, Germany was originally reported to have 1,800,000 French prisoners of war but in time many of them were classified as civilian labourers. Yugoslavs and Poles taken by Germany as prisoners of war were similarly reclassified following the flight of their governments after the defeat of their armies. The large numbers of Germans and Japanese who capitulated to the Allies at the end of the war were not usually counted as prisoners of war but rather as "disarmed military personnel."

The number of members of the armed forces of the belligerent countries held as prisoners of war during World War II was estimated at approximately 8,000,000. The two largest groups were not officially reported; they consisted of approximately 2,000,000 soviet prisoners taken by Germany and a similar number of axis troops taken by the U.S.S.R. Of the remaining groups, the largest was the French held by Germany, ranging downward from 1,800,000 in 1940 to 750,000 in 1945. Italians were held by both axis and Allied powers during the war; in 1945 the Germans held 550,000 while the Allies had 428,000.

Substantial numbers of British and U.S. men were held in Europe and the far east. Of the total of 308,000 British (United Kingdom and empire) prisoners in 1945, 200,000 were in camps in Germany and 108,000 were in the hands of the Japanese. At the same time, Germany held 95,000 U.S. military personnel and Japan had 15,000 U.S. prisoners of war in scattered camps in the far east.

Repatriation.—During the course of hostilities, only prisoners of war certified as seriously ill or seriously wounded were eligible for repatriation under the conditions of the prisoners of war convention. Mixed medical commissions accepted by the belligerent governments certified men eligible for repatriation. Repatriates were not to resume active military service. For the most part those repatriated were amputees.

Arrangements for the exchange of prisoners were extremely difficult to complete. The first exchange of U.S. prisoners of war took place at Lisbon, Portugal, in March 1944, when 35 former U.S. prisoners boarded the exchange ship "Gripsholm" en route to the United States. Although the "Gripsholm," under charter by the U.S. government, made a number of exchange trips to the far east and Europe, its passengers consisted principally of diplomatic representatives, or persons accorded diplomatic status, and civilians for whom special arrangements were made by the governments concerned. Only occasionally did the ship carry repatriated prisoners of war on its exchange voyages.

Very few Allied prisoners were liberated in the campaigns in North Africa and Italy. It was not until Rumania was forced to surrender in Sept. 1944 that any substantial number of Allied prisoners were freed by conquest. Consisting principally of U.S. fliers forced down in raids over eastern Europe, the group included 1,200 U.S. prisoners who were quickly repatriated by air.

The invasion of Luzon in the Philippine campaign early in 1945 brought dramatic liberation to 1,150 U.S. prison-

ers of war as well as to 6,600 civilian internees of various nationalities, mostly U.S. Swift thrusts by tank units deep into Japanese territory liberated prisoners at Cabanatuan and at Santo Tomas in Manila, and an amphibious operation at Los Banos rescued 2,200 internees.

Not until the surrender of Japan in Aug. 1945 were any large groups of Allied prisoners liberated in the far east. Remote camps were reached by air and relief supplies, comfort articles, medicines and messages from home delivered. Repatriation was rapidly arranged for all Allied prisoners in Japanese hands, some coming out through the Philippines and Okinawa; others were transported through China and India. This followed the pattern of speedy repatriation carried out in May and June 1945 for Allied prisoners liberated by the surrender in Germany.

The repatriation of axis prisoners in Allied hands at the end of the war proceeded slowly. By July 1946 all German and Italian prisoners had been transferred from the United States to Europe; the Italians had been released in Italy, some of the Germans released in Germany, others retained in labour battalions under Allied control. All of the Japanese military personnel taken by the U.S. forces were scheduled for repatriation by the end of 1946. No information was available regarding the release or transfer of axis prisoners in the custody of the U.S.S.R.

Repatriation was not required by the prisoners of war convention until the signing of peace treaties, but these treaties were still in negotiation at the close of 1946, more than a year after the cessation of hostilities. Discussions among the Allied powers were in process regarding the retention of prisoners for labour and reparation payments for specified periods beyond the signing of peace treaties but no formal agreement had been reached. During 1946, the Vatican and the Red Cross appealed to the Allied authorities to speed the repatriation of axis prisoners, but near the end of 1946 it was estimated that approximately 1,500,000 axis military personnel were still in captivity, not including an unknown number of prisoners still held by the soviet union.

The Red Cross.—In Sept. 1939 the International Red Cross committee—a self-perpetuating group of 25 Swiss citizens originally organized in 1863 and accorded special privileges as a benevolent intermediary—offered its services to the warring nations and subsequently to other nations as they were drawn into the conflict. With respect to prisoners of war, these facilities included: (1) the services of the central agency for prisoners of war; (2) the maintenance of International Red Cross committee delegations in belligerent countries; (3) the services of the relief bureau for the handling of relief shipments.

The central agency for prisoners of war was established at Geneva by the international committee as provided in the prisoners of war convention. In co-operation with information bureaus in the belligerent states, lists of prisoners were transmitted through the central agency at Geneva on behalf of most of the belligerents. They were handled both by mail and by cable. A card index was maintained of all reported prisoners and civilian internees who were accorded the status of prisoners of war. The agency recorded all changes in the status of prisoners as reported by governments, the committee's delegates in belligerent areas or by the prisoners themselves. The agency also handled inquiries about the location, health and welfare of

Some of the thousands of German soldiers taken prisoner following the collapse of German resistance in the Saar and Palatinate areas early in 1945

prisoners and arranged for the transmission of messages and documents for prisoners. At the end of the war the central agency's master file of cards of information about prisoners of war and civilian internees contained 35,000,000 cards.

The committee maintained delegations in all the belligerent countries (except the U.S.S.R.) and in certain neutral countries, such as Portugal and Sweden, through which goods for prisoners were shipped. The delegates in belligerent countries made regular inspections of prison camps, reported on conditions in the camps, endeavoured to meet the requests of the prisoners, made representations to the detaining powers, purchased locally necessary supplies, arranged for the distribution of food, clothing, medical supplies and other items sent from home for the prisoners, handled inquiries about and messages to and from prisoners, assisted in arrangements for exchanges and generally served as protectors of the interests of prisoners. Their reports were transmitted through the committee to the governments of the prisoners. No delegates were maintained in the U.S.S.R. Japan permitted delegations in Japan proper, in Shanghai and Hong Kong, although they were more limited in their activities than were delegations in other parts of the world. In spite of many representations by the committee, Allied governments and Red Cross societies, Japan refused to permit a delegate to function in the Philippines.

The relief bureau of the International Red Cross committee during the war handled over 300,000 tons of relief supplies for prisoners of war, the major part of which consisted of supplies furnished through the British Empire Red Cross organizations and the American Red Cross for Allied prisoners of war in Europe.

Supplementary Relief Supplies.—The prisoners of war convention permitted prisoners to receive parcels by mail, but these facilities proved inadequate to assure sufficient and equitable supplementation of materials furnished by the detaining powers. The British Red Cross, in co-operation with the Red Cross societies of the British empire, inaugurated in 1941 the system of standard food parcels and clothing sent in bulk for distribution to their prisoners in Germany. In contrast to the earlier system of addressing parcels to specified individuals, these supplies

were shipped undesignated by name. This pattern was followed by the American Red Cross in serving as the agent of the U.S. government to supply extra food and clothing to U.S. prisoners and as the agent of Allied governments and relief societies in supplying relief to other Allied prisoners. Parcels addressed to individual prisoners as contemplated by the convention were also permitted, but their dispatch was limited in number by government regulations permitting only the prisoner's officially listed next of kin to send parcels at specified periods. These parcels were forwarded through normal postal facilities.

Bulk shipments of relief supplies destined for prisoners in Europe were usually received at Marseilles during World War II. They were transported free over French and Swiss railroads to Switzerland and were then dispatched, again by free transport over German railroads, to specified camps. In the last year of the war, when the route through Marseilles became uncertain because of military activities in that area, Goeteborg, Sweden, became a transfer point for large quantities of relief supplies. Up to the very last days of the war, neutral vessels carried supplies into the German port of Lubeck, where representatives of the international committee received the goods and arranged for shipment to camps in the northern part of the German-controlled territory.

Anticipating the collapse of German rail transport in the final months of the war, the Allied Red Cross societies in co-operation with their governments supplied more than 450 large trucks and trailers to carry relief supplies to prison camps in Germany. These vehicles, painted white and bearing large Red Cross and Swiss emblems, criss-crossed Germany in the last days of the war, reaching camps isolated by the breakdown of normal transport, meeting columns of marching prisoners as they were moved before the advancing armies and bringing necessary food and medicines to prisoners of war.

Delivery in the camps was made to one of the prisoners known as the "man of confidence" or "spokesman." In enlisted men's camps he was chosen by the men; in officers' camps he was the senior officer. A general receipt signed by him was returned to the international committee, and the distribution to the prisoners was subsequently confirmed by individual receipts signed by the prisoners receiving the goods. The American Red Cross reported that in 1943 the record of delivery of goods consigned to Americans in prison camps in Europe showed receipt of 99.93% of the goods shipped. Delivery in 1944 and 1945 was somewhat less effective, occasioned in part by losses resulting from Allied air attacks on transportation points in Germany and general disruption in a country approaching military defeat.

Shipments to the far east were much more irregular and difficult. The Japanese refused to permit Allied or neutral vessels to enter the waters controlled by them in spite of many proposals of governments and Red Cross organizations. Cargo space on diplomatic exchange ships was used but only relatively small quantities could be transported in that way, since there were only two exchanges, one at Lourenço Marques in 1942 and one at Goa, in 1943.

Supplies from the British, Canadian, South African and American Red Cross organizations carried on the vessels engaged in these transfers were delivered to Allied prisoners in the far east through delegates of the International Red Cross committee, except in the Philippines, where delivery to prisoners of war and civilian internees was carried out by the Japanese army.

In 1943 the Japanese indicated that they would consider accepting relief supplies delivered through the ter-

Japanese prisoners of war at a camp on Guam listened silently to the announcement of Japan's unconditional surrender in Aug. 1945

German prisoners captured by the Red army, bearing out by their appearance of deadly fatigue their dread of the Russian front

ritory of the U.S.S.R. Soviet vessels carried to Vladivostok more than 3,000 tons of relief supplies furnished through the American and Canadian Red Cross societies. The Japanese arranged to pick up half of these supplies. The remainder was still in Vladivostok when the war in the Pacific ended.

Occasional shipments of food, clothing and comfort articles were made from Germany to German prisoners held in the United States and Canada. Although the Japanese in 1942 sent some tea for distribution to their civilian internees in the United States and Canada, they sent no relief supplies for their captured military personnel and did not inquire about their welfare.

The bulk of supplies delivered to prisoners was in the form of food and clothing, but books, games, sports, theatrical equipment and religious articles were also delivered. The Young Men's Christian association and the National Catholic Welfare conference were particularly active in furnishing such supplies from the United States. Delegates of the Y.M.C.A. were permitted to visit prison camps in many of the belligerent countries and arrange for assistance in educational, recreational and religious activities. Correspondence courses organized by the Y.M.C.A. and other organizations permitted prisoners to continue their education while in confinement. Extensive libraries were built up in many prison camps. In a number of camps the prisoners were permitted to publish camp newspapers.

In Aug. 1946 the International Red Cross committee took the first step toward applying the lessons of World War II to the revision of the prisoners of war convention. A meeting of representatives of national Red Cross societies convoked in Geneva reviewed the experience of the war and prepared and discussed recommended changes. This was to be followed in early 1947 by a meeting of government representatives to consider revisions. (See also DISPLACED PERSONS; FEDERAL BUREAU OF INVESTIGATION; INTERNATIONAL LAW; RED CROSS.)

Prisons

There were few innovations in prisons throughout the United States between 1937 and 1946. Nevertheless, it was

a progressive era because effective techniques for rehabilitating offenders were more widely utilized, and ineffective ones were discarded.

Georgia eliminated the chain gang and striped suit, and Rhode Island the dungeon used to discipline intractable inmates in the state prison. The dungeon consisted of an ordinary cell, with a solid wooden door covering the usual grill door. Prisoners confined there were fed entirely on bread and water and given a regular meal only once every five days.

At the Wisconsin state prison, the silent system, a relic of antiquated penal practices, was at last abolished and inmates were permitted to converse with one another. They were also permitted to smoke cigarettes. (Previously they could smoke only pipes.) For years, any outsider had the right to be taken through the prison upon payment of a 25-cent admission fee. That practice was discontinued in 1940 and visits were restricted.

In a number of prisons, ear phones were placed in each cell so that inmates could hear the radio programs transmitted from a master unit within the walls. Motion pictures also began to be exhibited, and outside lecturers were allowed to address inmates. The value of all this could not be overestimated. Allowing inmates to keep pace with world events through broadcasts and other media prevented them from deteriorating mentally and losing contact with the community to which most of them would eventually return.

At least ten states, following the example set by others in previous years, started to classify and segregate various types of offenders. The opening of farms and road camps allowed for the transfer of prisoners most likely to reform to places where they could live a more normal existence than within prison walls. In the classification, inmates were thoroughly examined upon their arrival at an institution and then subjected to the type of correctional treatment which could best effect their rehabilitation.

In 1938 the United States government adopted the most extensive prison-construction program ever undertaken. By 1940 new institutions were opened in Indiana, Colorado, Connecticut and Texas, and road camps were established in other sections of the country. This program was necessary to relieve the congestion resulting from the enactment of new federal statutes, the imposition of longer sentences and the sharp reduction of parole releases, all of which had added substantially to the inmate population. Similar conditions likewise forced some states, like Missouri and Tennessee, to build new penal institutions. The bulk of the construction was completed before 1940, when building materials were available. However, in 1941, and during the period of World War II, there was a sharp reduction

in crime. Many of the institutions were not filled to the extent that officials expected they would be.

In 1941 Maryland opened a new prison and farm for women, thereby eliminating the practice, long condemned, of incarcerating female offenders in separate wings of male institutions.

Prior to 1941 idleness was rampant in many prisons. But in that year, inmates began to manufacture matériel for the armed forces. As a result, idleness, the most deteriorating aspect of penal life, was practically eliminated. In fact, in some prisons, the inmates worked on two to four shifts, and in all instances patriotism rather than compulsion was the motivating factor. All told, inmates of state and federal prisons produced a total of almost \$125,000,000 worth of matériel during the period of World War II, including steel navy pontoons, submarine and cargo nets, uniforms, blankets, mattress covers, parachute cords, packing boxes for ammunition, rifles, stretchers, shirts, barrage balloons, camouflage netting and ropes of all kind. Penal farms also contributed a considerable amount of food (meats, vegetables and fruits). In recognition of these services, which also included laundry work and salvage and repair service for near-by army camps, many prisons received national service certificates, comparable with the army and navy "E" awards. Furthermore, thousands of inmates gave blood to the Red Cross blood banks and some acted as "guinea pigs" for the cause of science (e.g., at the New Jersey state prison, 201 inmates were used to develop a vaccine for sandfly fever; at the Atlanta federal penitentiary, about 200 inmates participated in a malaria control experiment). Prisoners also purchased more than \$3,000,000 worth of war bonds from their paltry earnings in prison industries.

With the termination of World War II, the matter of penal industries became an important problem for penal administrators. With war matériel no longer required, the question arose: "What can inmates now produce?" The improvement in institutional morale when inmates were kept busy demonstrated conclusively that idleness could not be tolerated if those confined were to be rehabilitated. Consequently, efforts were redoubled to place penal industries on a firm peacetime foundation. The most practical

Alcatraz prison in San Francisco bay, where 16 convicts attempted a jailbreak on May 2, 1946. San Francisco police and coast guard patrol boats are shown nearing the "fortress" after the warden's call for help to suppress rioting

way to create inmate jobs was to have institutions produce food, clothing and other articles for state institutions (e.g., hospitals, asylums, etc.) under what became known as the state-use system. An exchange of products between states was also advocated.

During the period 1937-46, many prisons also inaugurated sound educational programs. There were increased budgets for teachers, libraries and, particularly, vocational instruction, so essential to equip inmates with some means of earning a livelihood upon their release. Of particular interest was the discarding, in some institutions, of the old formal method of teaching and the adoption of the project method used in modern schools. This meant giving the student a graded series of tasks and promoting him as rapidly as he finished each one.

The federal government, as well as some states, opened training schools for guards. Usually the course lasted about four weeks; during that period they were given instruction in criminology and taught how to deal with inmates, with a view toward effecting the reclamation of the latter.

The problem of obtaining employment for prisoners upon their release had always been a vexing one. Private enterprise was reluctant to give them jobs, and even the state governments placed various barriers in their paths. For instance, it was often impossible for released offenders to obtain chauffeur's or plumber's licences. And prior to World War II, they were not permitted to join the armed forces. However, after Pearl Harbor, the army rescinded its previous ruling. To facilitate the induction of inmates who had completed their sentences, Selective Service boards were set up in all federal and state prisons. But not all released felons were inducted. Those convicted of the more serious crimes, as well as alcoholics, sex perverts, drug addicts and habitual offenders, were barred. Some states (e.g., Kentucky, Oklahoma, Texas, New Jersey and Michigan) enacted legislation permitting the parole of worthy inmates, prior to the expiration of their sentences, if the army would accept them. Many of those allowed to "join the colours" distinguished themselves. Some were

decorated for bravery; others were killed in action. But, most important, only a handful of former inmates reverted to crime. Because of this excellent record, it was hoped that both industry and government would be more liberal in giving jobs to former offenders.

Typical cell-block tier in the prison opened at Green Haven, N.Y., Oct. 1, 1941, to relieve overcrowding at Sing Sing and other "maximum security" prisons of New York state

Great Britain.—The years 1937–39 saw no significant changes in the development of the prison system of Great Britain, *i.e.*, the systems of England and Wales, and that of Scotland, separately administered. Seen in retrospect they marked the close of the second phase of the modern system, deriving from the directive of the Gladstone committee of 1895 that the treatment of prisoners "should be effectually designed to . . . turn them out of prison better men and women, both physically and morally, than when they came in."

The years before World War I had been spent mainly in clearing the ground, by legislation designed to keep out of prison all who could and should be treated by other means; *e.g.*, those who would respond to probation, mental defectives and children; and especially by the provision of the Borstal system of educative training for young people under 21. A striking reduction in the prison population followed the provision of 1914 requiring courts to allow time for the payment of fines. In the three years before World War I, the daily average population in the prisons and Borstals of England, Scotland and Wales was more than 20,000; in the three years 1937–39 it was under 12,000.

In the years between the wars the framework of the new structure became clear. All prisoners were employed in association on useful work for not less than seven hours a day. An evening educational program was provided, mainly by volunteer teachers from the outside community, with lectures and concerts of good music, and the community was also brought into touch with the prisoners through unofficial visitors, who came for friendly talks with the prisoners in their cells about matters of general and personal interest. Methods of classification were carefully studied and applied, and a significant advance was made by the opening of Wakefield prison as a training centre for selected prisoners: there the conditions were more open, the prisoners more trusted, the employments more skilled, the educational facilities wider: finally, the men might complete their training in an open farm-camp.

By 1937 these methods were proved: the time had come for further progress. For this, the Criminal Justice bill of 1938 was to prepare the way: its main provisions affecting the prison and Borstal systems were designed to restrict and eventually abolish the imprisonment of persons under 21 and to provide other methods of dealing with them; to improve the Borstal system; to provide more effective treatment for habitual criminals and to remove such out-of-date forms of sentence as "penal servitude" and "imprisonment with hard labour." World War II suspended this bill and also, for some years, further progress in prison and Borstal development.

On Sept. 1, 1939, war plans were put into force: to clear establishments in vulnerable areas more than 5,000 prisoners and Borstal inmates were at once discharged, and more than 2,000 transferred. In the course of World War II, 17 establishments sustained major damage, and 9 minor damage, from air attack. Fortunately, because of the strength of the buildings, the fine conduct of the staff and the excellent response of the prisoners, casualties were slight except at two establishments, and only one prison had to be temporarily evacuated. Other unfortunate effects of war were the serious loss of staff for national service, the virtual suspension of the educational program and the loss of many unofficial visitors.

On the other hand, the effect on the employment of prisoners was wholly beneficial. A wide range of skilled and semiskilled work was undertaken for the government,

often by novel methods; e.g., articles were made for government contractors under the technical supervision of the contractors' staff, and ordnance stores were packed for D-day under the supervision of the royal army ordnance corps. Shops were tooled and geared for high production. Prisoners worked outside the prisons, on farms or in timberyards, with only token supervision: in 1944 a daily average of more than 900 were so employed. Much work was also done for the forces in preparing trenches, roads, gun sites, etc. In all, the prisons of Great Britain made full contribution to national production and defense.

The trends of prison population during the war years were unexpected. In 1914-18 this population had fallen sharply to about 10,000, climbing slowly again to about 11,500 in 1938; but during World War II it rose quickly to more than 13,000 in 1942, more than 15,000 in 1944 and in 1946 passed 17,000. In the absence of the *Criminal Statistics* these figures cannot be related to the incidence of crime, but certain factors are interesting. In England and Wales the female prison population increased from about 700 in 1938 to about 1,460 in 1944, and that of courts martial prisoners from about 100 in 1938 to nearly 1,000 in 1944: both these factors, explicable by war conditions, were already decreasing in 1946. Available evidence suggests that the increase in the male criminal population was rather the result of longer sentences than of larger numbers of prisoners received.

From 1944 a steep increase in Borstal committals began, raising the population, which had been about 2,500 in 1938, to about 3,500 in 1946. These increases led to much overcrowding, which, combined with understaffing, created difficult conditions for both administration and staff. The end of hostilities, with the return of staff from the forces and the reopening of recruitment, made it possible to plan for taking over additional accommodation, and in England and Wales during 1946 three closed prisons were reopened, and a former U.S. hospital was taken over as an open prison for long-sentence prisoners of "first-timer" type. Various camps and country houses were also acquired for boys' Borstals, of which 6 new ones were opened, together with an additional Borstal reception centre, while 2 country houses were taken as Borstals for 50-60 girls, to be run as small homelike units on new principles.

In Scotland, a new Borstal of the open type was set up in 1946 for 30-40 selected boys working mainly at market gardening and arrangements were in hand for a similar institution with forestry as the main occupation. In both countries, the existing tendency was to concentrate, in the training of young people, on close personal contact in small units with a highly selected staff. At the girls' Borstal in Scotland selected girls were sent out to local employment before release, and the extension of this practice, with the acquisition of a hostel for the girls, was under consideration.

In England and Wales plans for extending the training system for adults were prepared in 1945, the intention being to open three more training centres so as to cover the whole country on a regional basis, but to admit not only first-timers but also men with two or even more convictions who still offered hope of reform. In the impossibility of building suitable premises for some years, Maidstone prison in Kent was converted as one centre, and camps or country houses were being sought for two others. A country house was also acquired, and another was being sought, to enable the application of the principle to women.

Significant developments of detail in the training of prisoners during the period under review included permission to converse at exercise, taking of meals in association, the general introduction of small cash earnings for satisfactory work and, at many establishments, the taking over of management of education and the library by the county or city authorities.

These administrative steps, with the announcement by the home secretary of his intention to reintroduce as soon as possible an amended version of the Criminal Justice bill, may be said to have opened the way to the third stage of the progressive development of the penal system of Great Britain. France.—In 1944 the provisional government of France sent a special commission to Guiana to supervise the liquidation of the penitentiaries there. It was ascertained that there were about 14,000 inmates confined in the institutions and about 600 *relégués* (men who had completed their terms and were living in Guiana). The commission obtained pardons for inmates who had served 15 years, and exoneration for the *relégués* who were later granted permission to return to France. By 1946, 899 prisoners were liberated, and the penitentiaries in Cayenne and the Island of Salut were closed. The penitentiary in Saint Laurent was still used to house some inmates, because lack of transportation facilities prevented their being returned to France for incarceration in institutions there. Some of the *relégués* would remain because they were too ill to leave, although the French government was providing excellent medical care for them. (See also CHILD WELFARE; CRIME.) (L. E. L.)

Progressive Party, U. S.

The Wisconsin Progressive party was organized at Fond du Lac, Wis., on May 19, 1934. The name of the new party, its political principles and its leadership were derived from the "progressive" or liberal faction of the Wisconsin Republican party (as opposed to the "stalwart" wing). The party had no connection with the national third parties of 1912 and 1924, which bore the same name, except that it was an offshoot of the same political movement in which the elder Robert M. La Follette exerted

leadership both in Wisconsin and nationally.

On a platform emphasizing the obligations of the government to afford basic economic and social rights to the people with respect to employment, education and social security, the new party had phenomenal success in Wisconsin in 1934 and 1936. Under its banner, Robert M. La Follette Jr. won re-election to the U.S. senate (in the seat to which he had been elected as a Republican in 1925 and 1928, initially to fill the unexpired term of his father). Philip F. La Follette, the younger son of the elder La Follette, was elected as governor of Wisconsin under the same banner in both 1934 and 1936. The Progressive party captured seven out of ten Wisconsin seats in the national house of representatives, in addition to the La Follette senatorship, but never obtained a clear majority over the Republicans and Democrats in the state legislature.

Early in 1938 an attempt was made to organize the party on a national scale, state by state. The N.P.A. (National Progressives of America) was launched at a rally in Madison, Wis., on April 19, 1938, with a program laying stress on public control of money and credit, the right to work, expansion of social security, protection for individual opportunity and safeguards against dictatorship. The efforts were doomed to failure a few months later in the 1938 elections, when a coalition wrested control of the Wisconsin state government from the Progressive party.

Party fortunes continued to ebb when international issues and the war blotted out domestic issues. The Progressives re-elected Sen. La Follette in 1940 and the gubernatorial candidate Orland S. Loomis (who died shortly thereafter before taking office) won his race on the Progressive ticket in 1942, while the rest of the ticket ran far behind. In 1944, the party obtained only 76,000 votes as against more than 600,000 it had polled in Wisconsin in previous years.

At a state-wide conference at Portage, Wis., on March 17, 1946, party delegates voted overwhelmingly to return to the Republican party. Sen. La Follette thereupon ran for the Republican nomination for senator on Aug. 13, 1946, but failed in his bid by 5,600 votes. (See also ELECTIONS; WISCONSIN.)

Protestant Episcopal Church

For the Episcopal Church, the decade 1937-46 was a period of sustained work and growth in the midst of adverse conditions and events including a long continued financial depression, World War II, and the vast problems and issues of the postwar world. These world conditions deeply affected the thought and life and work of all churches and, overshadowing all other events, the release of atomic power opened a new age and confronted mankind with a choice between world-wide devastation or the establishment of just and lasting peace.

In the midst of this eventful and troubled decade, in 1943, the Episcopal Church reached the highest membership in its history. In that year, the numbers reached 2,188,573 baptized persons, of whom 1,520,394 were communicants. That growth was sustained in later years.

For a number of years previously, up to about 1930, the

growth of the Episcopal Church relative to the total population of the United States had been unfavourably affected by the immense flood of immigrants from continental Europe, none of whom had any Anglican background. When this immigration ceased, however, about 1930, the Episcopal Church at once showed remarkable growth relative to the population. In the decade 1930-40 the increase in the total population was 7.24% and the communicants of the Episcopal Church increased 14%, a growth almost twice the growth of the population.

The United States in the postwar period offered a vast field for Christian evangelization; some 50% of its people still acknowledged no affiliation with any church. For this home missionary work the Episcopal Church was well situated, because it was organized on a national basis, and although still weak in some parts of the United States it was planted and at work in every state and territory. The striking growth of the Episcopal Church was shown by the fact that in 1840 the church had only 19 bishops; in 1940 it had 151 bishops and in 1946 the number was 159. Whereas in 1830 the Episcopal Church had only one communicant to 415 of the total population, in 1941 the ratio had grown to one communicant in every 92 persons in the population.

But the work of the Episcopal Church was not confined to the United States. In the decade 1937-46, in spite of World War II and the conditions resulting from it, there was a remarkable growth in a number of the extra-continental missionary districts of the Episcopal Church—Alaska, Honolulu, the Panama Canal Zone and Puerto Rico. In foreign missions the developments were still more striking, although the war had brought destruction and suffering beyond description in these areas.

In the Philippines, the opportunity for the work of the church was greater and more hopeful than ever before.

In China, in spite of the tragic conditions still continuing, the opportunity was beyond estimate. The anti-foreign feeling which once existed against Americans and Christians had disappeared. This vast field now stood open to the church, as one of the most important of all missionary fields. In prewar Japan, the work of the Episcopal Church, and of all churches, had been seriously hindered and curtailed by the government and seemed, during the war, to have been almost destroyed. After the end of the war, however, the situation was so changed, and the attitude of the people was such, that the outlook for the work of the church in that land seemed to be one of great hope and promise. Both in China and Japan the missionary churches which the Episcopal Church planted and fostered were now entirely independent and self-governing while continuing in full communion and fellowship with the Episcopal Church and the Anglican communion. The epochal events and experiences of the decade 1937-46 and the stupendous postwar problems brought a new and great call to the whole Christian church throughout the world. In the Episcopal Church, this urgent call had three chief effects. It brought a marked stirring of the church's own faith and spiritual earnestness; it deepened and strengthened the sacred spiritual relationship between the Episcopal church and the other churches of the Anglican communion; and it aroused in the Episcopal Church a deepening realization of the need of world-wide Christian reunion, a union not only of Protestants on the one hand or of Catholics on the other but a union of all Christians. Psychiatry

Partly stimulated by World War II, psychiatry moved forward rapidly during the decade from 1937 to 1946. New avenues of approach in psychiatric investigations by means of biochemistry, physiology and pharmacology were opened up in the study of the construction of the individual integrals of all living organisms. Research into biology of the growth and organization responses of the body was contemplated, eventually aimed at detecting defects and disorders at an early stage of development. The study of twins, for instance, furnished many new research problems in heredity, with a direct bearing on psychopathologic conditions. In general, psychiatry attempted to take advantage of the great attainments of research in other fields of medicine. The same problems, however, which held back biologic research in general also eluded the psychiatrist. Although it had been long accepted that the body is composed of cellular units, the actual forces controlling their development and multiplication remained unknown. Only when these processes were understood could the part played by constitution in disease or in behaviour disorders be elucidated.

The chief advances in clinical psychiatry were the development of various "shock" methods of treatment, particularly electric convulsion methods, the growth of electroencephalography, the expansion of studies on the subconscious by means of drugs (narcoanalysis), the integration of the material disclosed by narcosis and the expansion of the field of psychosomatic medicine, bringing out the far-reaching effects of the emotions on bodily function. The gains in psychiatric knowledge were greater in the decade 1937-46 than in any other equal period of time.

Shock Treatments.—When an appropriate amount of insulin was injected intramuscularly, and carbohydrates were restricted in the diet, patients rapidly passed into a state of coma. This condition, called "insulin shock," could be quickly terminated if glucose, a form of sugar, was given by stomach tube or intravenously. During the state of shock, convulsions occurred. Although the effect of the hyperinsulinism on the blood sugar could be measured, the actual cause of the brain changes, leading to coma and convulsions, were undetermined.

It was this grave, and somewhat dangerous, form of therapy that was used in the treatment of the most serious form of mental disease, schizophrenia (dementia praecox). The procedure, introduced in Vienna by Manfred Sakel in 1933, became widely used after that time throughout the

world in the treatment of this disease.

Other methods of creating a condition of shock soon followed the initial efforts of Sakel. Metrazol was the principal drug used, but shock by electric methods was later introduced and made relatively safe. Electric shock, largely because of the ease of administration and control, almost supplanted other forms in the treatment of mental disease, except in the case of schizophrenia.

The results with insulin shock therapy in schizophrenia were evaluated after a period of seven to ten years' trial with this drug. Practically all reports indicated that the percentage of remissions in cases of schizophrenia following insulin treatment was definitely increased. Many patients, previously confined to a hospital, were maintained at home, in greatly improved health. The insulin method appeared to give the best results with schizophrenia. There were, however, a number of contraindications noted to its use, particularly heart disease, tuberculosis and organic diseases of the body. The method was not, moreover, without danger. Prolonged coma was the most serious complication.

The other forms of convulsive therapy were less favourable in the treatment of schizophrenia, but were of use in the therapy of the involutional states, manic depressive psychoses and other depressive reactions. Many organic diseases of the body, however, precluded their use. Fractures, or dislocations, resulting from the often violent convulsions occurred, but the sudden seizures resulting from shock were somewhat controlled by the drug, curare. As electroshock caused a greater and more prolonged memory loss than did metrazol, it was favoured by most psychiatrists. The shocks by electric methods, moreover, were easy to administer and the convulsions were not severe, thus lessening the danger of damage to the body. There was no memory of the treatment by the patients.

The exact nature of the response to all forms of convulsive treatment was not clearly determined. A convulsion appeared to be necessary for effective treatment. About 8 to 20 shocks were given for depressions; 20 to 50 for schizophrenia. In general, psychiatrists were convinced that shock treatments, when properly given by qualified physicians, had become a definite part of therapy. It was possible, however, that only the secondary, presenting features at the periphery of the personality, and not the matrix of the psychosis, were changed by shock therapy.

Psychosurgery.—In the affective forms of mental disease, particularly in the simple depressions, where the symptoms are of an emotional character, with changes in mood, the value of the original work of Egas Moniz on surgical destruction of the association pathways to and from the frontal lobes of the brain was confirmed by many psychiatrists. This radical procedure, called prefrontal lobotomy, requires a bilateral trephine of the skull, followed by a deep cutting of the brain substance, a destructive process without possibility of restoration of function by healing of the wound. The operation was not widely recommended, but in selected individuals, particularly those showing fear, physical and mental agitation, aggressive violence and acute mental suffering, lobotomy was accepted as a valuable method of treatment.

The technique of lobotomy following Moniz was further developed by Walter Freeman and J. W. Watts. The general subject of psychosurgery became widened and the results, after periods of observations lasting years, were evaluated in considerable detail. Most patients showed a relief from anxiety after the operation, and many previously institutionalized were able to live at home.

The psychological changes most frequently noted fol-

lowing lobotomy were a change in personality, with indolence, outspokenness, and a hasty, undiplomatic and often tactless form of speech. Many patients were apologetic when their actions or words were uncontrolled. In general, emotional outbursts were brisk, shallow and short-lived. Brooding, melancholy, hurt feelings and grim silences, frequently the main characteristics of the pre-operative state, tended to disappear. Grudges were no longer harboured. The intellect always remained intact. The operation was found useful, in addition to its value in agitated depressions, in chronic, long-standing cases, especially in patients with a poor prognosis.

The results of prefrontal lobotomy varied considerably with the types of mental disease suffered by the patients. Some selected schizophrenics did well. Those with criminal antisocial tendencies failed to improve. About one-third of all patients operated upon were considered as significantly recovered. The whole subject of psychosurgery was not fully evaluated, for a resurvey of the condition of these patients after a longer period of observation was felt to be needed. The durability of the reported ameliorations and the reaction types most likely to be benefited could only be estimated eight to ten years after operation.

Epilepsy and Electroencephalography.—The convulsive states, particularly the epileptics, were extensively investigated by electroencephalography. Hans Berger of Jena, by the application of electrodes to the scalp, observed electric waves originating in the cerebral cortex. The brain was found to "beat" in a definite rhythm, a fact previously unknown before electronics made possible the detection of minute changes in electric potentials. That these could be recorded from the surface of the head was an observation of prime importance leading to a new evaluation of brain function, both normal and abnormal. The recording apparatus was termed an electroencephalograph and the record an electroencephalogram. The instrument was analogous to the previously developed electrocardiograph, used to detect changes in the electric potentials of the heart.

Electroencephalography was found to be limited in scope, for only the potentials between two points could be recorded by a pair of electrodes. The modern record, however, consisted of a series of waves, usually taken from 8 or 16 areas of brain simultaneously. As millions of nerve cells in the brain "beat" rhythmically, the electroencephalogram made a record of only a few areas at any one time, thus providing a restricted experimental study of cerebral physiological activity. Nevertheless, electroencephalography

greatly advanced the knowledge of brain disease, for characteristic patterns of electric changes were soon observed in epilepsy and in tumours of the brain.

In the cerebral cortex there was found a summation of the action potentials from thousands of cells which build up a rhythm with an average frequency of 8 to 12 per second. These waves were observed to have voltages of 20 to 60 microvolts each. Potentials were amplified a million or more times by the encephalographic apparatus before being recorded by means of an ink-writing oscillographic pen or moving paper. The most frequent wave seen, with a rate of about 10 per second and found in the parieto-occipital cortical areas, was called the "alpha rhythm." A "beta rhythm" of 13 to 32 per second and of lower amplitude was observed in the frontal areas of the brain. Less frequent was the "gamma rhythm," also found in the frontal lobes, of 33 to 35 waves per second. A "delta rhythm" was also disclosed, with waves of 1 to 8 per second. These regular patterns were discovered not to develop in man until the eighth or tenth year of life. Closing the eyes brought out slower and more uniform waves, and even slower waves were observed in sleep. Cerebral rhythmia, however, was remarkably constant in man.

Epileptic seizures of all types were always associated with marked disturbance of the normal rhythm. So pronounced were these changes that the name "paroxysmal cerebral dysrhythmia" was suggested as a synonym for epilepsy. The term was widely accepted, although a few "normal" persons showed some of the changes, possibly resulting from subclinical, but potential, epilepsy in such individuals.

In epilepsy of the grand mal type, it was found that dysrhythmia was most marked, with increased frequency of the waves and a change in their shape. Petit mal showed waves of greatly increased amplitude and variations in shape, with spike and sinusoidal waves alternating. Patients with psychomotor attacks, another variety of epilepsy, had waves in their electroencephalograms of still another pattern. Thus the three types of seizures were found to have distinct cerebral rhythms.

In addition to diagnosis and prognosis in epilepsy, the electroencephalogram proved helpful in determining the value of various methods of treatment, even in some cases when given before the onset of clinical seizures. It was noted that most anticonvulsant drugs slowed the cortical rhythm and they were therefore more effective in grand mal than in other types of epilepsy.

Brain tumours were also found to cause alterations in the electric potentials of the cerebral cortex. When electrodes were placed near the site of a tumour, slow waves of the delta type were observed. When tumours produced localized convulsions, the waves were sharp, with a tendency towards spike formation. The electroencephalogram proved to be an aid, therefore, in localizing tumours before operation.

Psychiatry in the Selection of Army Recruits.—Keeping in mind the heavy toll of psychiatric casualties in World War I and the costly care of the veteran with nervous and mental diseases in all countries following that conflict, there was an attempt in World War II to select men and women for service with the armed forces with greater vigilance than at any time in the history of psychiatry. The problem was quickly recognized both by doctors and line officers, for men mentally unfit for war were a burden to commanders in training camps as well as in the field. An effort therefore was made to "screen out" all recruits with unstable nervous systems, particularly those who had failed

Sample patterns of brain waves in various conditions of mental health and illness, from Gibbs, Gibbs and Lennox in *The American Journal of Psychiatry*

to meet adequately the problems requiring adjustment in ordinary civilian life. The severe alcoholic, the feeble-minded, the frankly psychotic or those individuals with hereditary taints were automatically rejected. Epilepsy and migraine were harder to detect, but they too were considered reasons for elimination when found.

The psychoneurotics presented the greatest problem. Although it had been clearly shown that from one-half to two-thirds of the men who developed neuroses of an incapacitating nature in World War I showed signs of such a disability before induction and that the armed forces had no place for the so-called "problem" boy, many such were not rejected in World War II. Examinations were often hastily conducted, and trained psychiatrists were too few to cope adequately with the rush of recruits at induction centres. There was an attempt made to eliminate the unfit during the training period, but in places where there was official apathy many men were retained in service, only to break down under the great strain of modern mechanized warfare. The decisions, moreover, were not easily made. Some psychiatrists tended to overexaggerate the importance of the unstable man, but, in general, line officers expressed a willingness to acknowledge functional and mental disorders. It was widely recognized that the public and the military officials had learned a good deal about mental illness between 1917 and 1939. Psychiatrists with actual battle experience tended to reject a larger percentage of recruits on neuropsychiatric grounds than did those who had never seen mental casualties under fire.

If unfit men were missed at the induction stage, many were identified at the training camps, provided psychiatric advice was available and an understanding commanding officer was in charge. The sudden change of environment and the strict discipline soon uncovered psychopathic tendencies in the new men, particularly at the time of life, the adolescent period, when character, habits and personality were being moulded. The unstable soldiers tended to become discouraged, showed defense reactions and even resorted to malingering. The chief complaints were the most simple ones—enuresis, hysterical seizures, painful feet and inability to swim. Few showed marked antagonism or engaged in misdemeanours requiring punitive action. These traits were not acquired, but were simply brought out in men with psychopathic constitutions. If such individuals were not promptly eliminated at the training centre a large percentage of them broke down under the stress of war.

Screening was not entirely successful in the U.S. or in other countries. The chief factor in the failure was the urgency in developing great armies quickly. Good psychiatry was found, as in the past, to be based on slow, careful analysis of character, traits and moods. When speed was essential and psychiatric surveys were curtailed, the percentage of unfit men passed was augmented.

Although the technique of war was considerably modified by mechanization in World War II and the reaction pattern of men under stress was in many cases changed in form, the same fundamental conception of faulty emotional stabilization was held as the underlying cause of the psychoneuroses of war, as in civilian life. World War II produced less hysteria and hysterical reactions than did World War I, with more anxiety tension states, but this made little difference in the selection of recruits.

In the U.S. the rejection rate at induction centres in World War II was about 7 to 8 men per 100 examined, a figure that comprised nearly one-third of all rejections for

all causes. A somewhat similar service rendered by psychiatrists during the induction of soldiers for World War I, found about 2 men per 100 with mental unfitness. The final success or failure of the screening method was approximately estimated, by measuring the rejection figures with the discharge rate in the U.S. army for neuropsychiatric disorders. In World War I the total rate was about 0.7 men per 100; in World War II the rate was reduced to approximately 0.4 men per 100. Psychiatrists felt that these results indicated that something was accomplished by the more intensive screening carried out in World War II. Many officers expressed an opinion, however, that if the examinations had been more fully conducted, a larger percentage of nervous breakdowns in the army under battle conditions could have been avoided.

War Neuroses.—Although many types of neuroses were observed in World War II, the separation-anxiety type of depression was the outstanding reaction. The world-wide nature of the conflict, the isolation of many military posts and the long periods of inaction were factors in the development of this special form of neurosis. When group spirit failed, morale became low and the phenomenon of panic in a military unit sometimes affected all members of the group simultaneously. High morale always exercised a profound influence in counteracting the ill effects of dependence on home and family and was a striking aid in supporting emotional stability in soldiers.

On analysis, the anxiety complex of war disclosed the same causes as activated the peacetime emotional disturbances. When a study of complete social histories was made, broken homes, psychosis in the family, faulty education, occupational maladjustment, antisocial behaviour and alcoholism were found. A history of broken homes occurred in nearly one-half of the cases investigated.

The war environment, however, tended to colour the neurosis. During occupation of Guadalcanal by the U.S. marine corps, for instance, sleeping and eating were almost impossible. Rain, heat, insects and malaria contributed to the disordered thinking and living. The strain lasted for many months, and the men lost weight rapidly. Although the hardened soldiers were intellectually normal, some became emotionally unstable and showed marked neuromuscular tension. Fear of cowardice was almost universal. Few such cases, with headaches, lowered thresholds to sharp noises, periods of amnesia and of panic, sensory somatic complaints, muscular loss of tone, tremors and palsies, could be returned to full or combat duty. In spite of such emotional disturbances, most of these men were able after discharge to enter civilian life and take their usual places in society.

In other areas of active combat, similar situations developed. The British found many cases of anxiety neurosis in the attack on Norway. The rapid action of the Libyan campaign, on the other hand, with a better-trained army, caused few nervous breakdowns. The incidence rose in the Tunisian battle and at one time comprised 10% to 15% of all casualties. It was observed, as in other fields of battle, that when the morale of a unit was high and the officer-man relationship was good, there was less tendency for individuals to break down under combat.

Although frank psychoses were rarely encountered in the armed forces, some severe hysterical episodes presented schizophrenic symptoms. The onset was usually explosive, the patients showing panic states with aggressive tendencies, acute depressions with suicidal drives and other marked symptoms. The reactions were often brief and there was a large percentage of recoveries, more frequent than in civil life.

Seasickness was a type of emotional disturbance found particularly in the navies, but not uncommon on troop transports. Two rather definite types were disclosed on examination. One was constitutional, with a uniform history of nausea and vomiting on all moving vehicles such as cars, trains or roller coasters. The senses of smell or of taste, or the sight of blood was sufficient to initiate the attack. Similar symptoms occurred during combat from anxiety and other emotional disturbances. Most patients in this group were neurotic or unstable individuals and efficiency at sea in naval officers was extremely low. No amount of effort towards keeping the officers or men at sea overcame this type of seasickness.

The second type of seasickness was characterized by a lack of nausea and vomiting from emotional situations. Although the symptoms occurred with considerable frequency and often were not entirely curable, most men did well on larger ships or on land duty. In both groups a large percentage of gastrointestinal abnormalities was found, in many cases relieved by surgical operation or medical treatment.

The most valuable prophylactic against nervous breakdown in combat conditions was found to be adequate training in the ground schools and navy establishments and the certainty that all men were fully drilled in the technical skills needed to use the complicated weapons of modern warfare. In well-trained units, only about 2% of the men who broke down had to be evacuated to a base; after a period of rest many returned to some kind of full duty within a few weeks. Medical officers, too, were trained to watch for signs of stress, such as changes in mood or personality, loss of attention, amnesia and restlessness. When men were quickly removed from danger spots under these conditions, many recovered rapidly and completely. Treatment was most efficient when given near the front lines. In general, less than 5% of the mental casualties were discharged from the services because of prolonged or permanent symptoms.

All military psychiatric statistics were evaluated in the light of the military situation. A line was drawn between sickness and well-being, different from that of civil life. Inadequacy, in a military sense, was found to be an all-inclusive term and not, therefore, a fair peacetime estimate of a person's capacities and capabilities. On account of this many men, discharged from the services for reasons of emotional instability or personal inadequacy, adjusted themselves well when back in civilian life.

The use of drugs, given intravenously, to induce a state of narcosis as a means of treating the acute mental reactions in combat troops was used extensively in World War II. When British soldiers were evacuated from Dunkirk, sodium amytal was given by the intravenous drip method to ensure prolonged sleep, sometimes lasting under controlled conditions for days. This form of treatment proved effective for the exhausted soldiers. Feedings were also given by vein. When small doses were dripped in slowly, a condition of narcosis was established, somewhat similar to the dreamy state of hypnotism. Patients, otherwise unable to report their terrifying experiences, frequently were able to do so when narcotized. At this time suggestion and persuasion, important methods of psychotherapy, were found to be more efficient than during the waking state. The same general method of treatment was used extensively by the U.S. Army air forces in the treatment of combat fliers. Sodium pentothal, a similar narcotizing agent, was given intravenously, both as a diagnostic tool and as a means of therapy. Under narcosis, psychiatrists obtained a clear view of the intensity of anxiety, the degree of re-

gression experienced, the strength of the dependent trend and the dynamic relation of these factors to each other. Simple exposure of the conflicts did not always achieve synthesis, for the material revealed was frequently lost when the soldier was aroused from the effect of the pentothal, and no change in his emotionally disturbed state had occurred. The effects were similar to the sodium amytal "interviews" (narcoanalysis), long used in civilian psychiatry. The benefits resulted almost entirely from the knowledge gained by the psychiatrist concerning the patient's concealed difficulties. The next step was the synthesis of the material revealed, the painful or traumatic events, the anxieties and hostilities connected with them, being accepted by the soldier's ego. When accomplished, this process, known as narcosynthesis, enabled the man to live with his conflicts in an economical and realistic fashion and give up the neurotic compromise which had resulted in his symptoms. Narcosynthesis, as developed in World War II, opened up a new and important method of treatment in psychiatry. Its use in civilian life had yet to be fully evaluated at the end of the decade.

Aviation Psychiatry.—Certain mental disturbances peculiar to aviation were noted during World War II. A chronic functional nervous and psychic disorder known as aeroneurosis was characterized by nervous irritability, insomnia, minor psychic trends and gastric distress. Occurring almost exclusively in experienced pilots, it was commonly known as "staleness." A similar condition had long been recognized by professional civilian pilots. On analysis it was seen that emotional stress was the principal exciting factor since, in order to fly, repression of many thoughts, mainly varieties of fear, is necessary. If such repression was not successful, conflicts arose, for the instinct of self-preservation, constantly in mind in aviators, was capable of causing profound emotional disorders. Even when fear was repressed subconsciously, pilots were affected by it every time they went into the air. Flight surgeons were able to detect signs of aeroneurosis quickly, often before the pilot himself was aware that anything was the matter.

"Flying fatigue" was a different syndrome, due to highly abnormal flying strain, as often occurred in combat conditions. The emotional factors noted in aeroneurosis did not appear, but the condition, slow of onset but rapid in development, led to deterioration and disintegration of mental and physical faculties.

Of particular importance in aviation was aeroembolism, a condition produced by rapid decrease of air pressure below one atmosphere. This occurred at altitudes above 12,000 ft. Symptoms came on rapidly, with a decrease in acuteness of hearing and vision, blunting of judgment, impaired critical perception, indolence of thought, forgetfulness and absentmindedness. Changes in mood, a diminution or loss of the will to perform certain duties (although the ability to perform them was essentially unimpaired) were also recorded. Pilots were usually unaware of these symptoms, and disasters were frequent when precautions were not taken. At heights above 18,000 ft., all symptoms were exacerbated. Aeroembolism was caused by bubbles of nitrogen escaping from the blood stream and lodging in various parts of the body, particularly the brain. When an uninterrupted supply of oxygen was given, high-altitude flying above 12,000 ft. was possible, and aeroembolism was abolished. Pilots showed considerable variation in their ability to withstand high altitudes, some requiring little oxygen even above 12,000 ft. The failure of the pilot to

recognize his own condition was the chief cause of accidents. In addition to aeroembolism, damage to the brain from lack of blood supply was caused by the execution of sudden and greatly accelerated dives and turns. Special suits of clothes were devised in an attempt to stabilize blood volumes and prevent loss to the vital brain centres from the effects of centrifugal force.

Civilian Reactions to Air Raids.—During World War II, the extensive bombing of cities gave rise to some mental reactions in the civilian population of a particular nature. In almost no instance was widespread panic observed. Even in the heavy night attacks on London and other large cities, many persons managed to sleep through raids. Inaction, particularly in shelters, during bombing caused considerable nervousness, but trained group leaders were a marked factor in overcoming fear in civilians. Even worse than the air raid itself was the general effect on living conditions, with fatigue, lack of sleep, improper diet, loss of homes and disruption of communications as the chief factors in social disorganization. No psychiatric syndrome developed that could be called an "air-raid neurosis." There was some increase in London hospitals of such disturbances as perforations of gastric ulcers, thought to be on a nervous basis, attended by anxiety, poor diet and increased smoking and drinking. In general, air raids tended to reduce, rather than cause irrational mental attitudes and even made good citizens better. An increase in the war effort was frequently noted in areas most severely raided.

Rehabilitation.—In spite of the large numbers of men rejected for military service or discharged on the basis of neuropsychiatric disability, reorientation into civilian life was not nearly so large a problem as had been anticipated. This was partly based on the fact that the term "psychoneurosis," as used in military centres, did not prove to be entirely justifiable in civilian medical diagnosis. Many patients with fears, anxieties and mild depressions were given a military diagnosis of psychoneurosis. In most cases, these symptoms were of a temporary nature, a maladjustment caused by the war which was readily righted, often without psychiatric help, by a return to normal surroundings.

When psychiatric help was needed, rehabilitation clinics were set up, the best being distinct community ventures in which the local physicians and employers were an integral part. Some farsighted industrialists kept in touch with their employees during the war. Thus, when these men and women returned there was an already established basis of understanding even for individuals who had been rejected or discharged on psychiatric grounds. It was found that the group with battle-incurred disability and those discharged as unfit for service because of slight mental disorders did not prove to be much of a problem in rehabilitation.

Preventive Psychiatry.—In active combat it was found that the danger of being killed or maimed imposed a strain sufficient to be the primary cause of nervous breakdowns. An analysis of battle casualties in the U.S. 5th army showed that 50% of the original strength were either killed, wounded, captured or missing after a combat period of 120 days. The infantry suffered the greatest loss of manpower from psychiatric disorders. Based on the assumption that military psychiatrists at the front were dealing with normal men in abnormal situations, and realizing that mental hygiene education and individual counselling required time and skilled personnel not available during the war, doctors recommended environmental modi-

fication as a method of prevention. When it was found that infantrymen either developed an incapacitating neurosis or else became hypersensitive to shell fire, or so overly cautious and "jittery" that they were ineffective and demoralizing to replacements, a time limit of 120 aggregate days was advised. The worst reactions usually occurred after about 200 combat days. Other recommendations dealt with the sending of replacements up to the front in groups rather than singly, preferably men who had been trained together. Such changes in environment, easily made in war, were less possible in civilian life. It was pointed out, however, that industry appeared to offer a particularly favourable field for this approach to preventive psychiatry. Wages, hours, working conditions, priority rights, promotion, selection and incentive systems were investigated in relation to the mental health of industrial workers. Psychiatrists suggested that environmental changes involving policy and procedure in industry, education, religion and government needed to be studied, with the mental health of the population in mind.

Alcoholism and Drug Addiction.—The subject of alcoholism, its causes and treatment, was extensively investigated by psychiatrists, both in the laboratories and in the clinics. Little evidence was produced to show that the alcoholic is essentially a psychoneurotic. Relatively few persons subjected to severe social and emotional difficulties, and who had a high incidence of other psychoneuroses or even psychoses, became alcoholics. There was a trend in psychiatric thought to consider alcoholism as a part of contemporary culture in that so many social habits develop in response to cultural sanctions. From this standpoint the teetotaler was considered as abnormal as the habitual drinker.

Alcoholism was looked upon as a conditioned reflex, of the type of other reflexes developed by Ivan Petrovich Pavlov and widely accepted as physiologically sound. Treatment based upon the conditioned reflex principle was successfully used in many cases. Drugs of a nauseating type were first given to set up an unconditional reflex of vomiting. The sight, smell or taste of alcoholic beverages served as the conditioned stimulus. When fully developed, a strong and definite aversion to the sight, smell or taste of alcohol in any form was produced. The treatment depended upon co-operation of the patient and prolonged care under controlled conditions in a special hospital.

The subject of alcoholic addiction was greatly advanced by the establishment in 1939 of the *Quarterly Journal of Studies on Alcohol*, and the development of a Research Council on Problems of Alcohol, affiliated with the American Association for the Advancement of Science.

Concerning drug addiction, opinions were confirmed that the steady use of opiate drugs produces virtually no known significant pathological symptoms, aside from the addiction itself; few addicts become moral degenerates and not a few successful, professional and business men are addicted to drugs and take them without signs of mental deterioration for years, provided their supply is adequately controlled by a physician. Marijuana, an extract of the hemp plant, was found to weaken the will, but seldom, if ever, makes the user so weak, as popularly supposed, that he will commit rape, suicide or murder. The drug was found not to be strongly habit-forming. (See also INTOXICATION, ALCOHOLIC; MILITARY MEDICINE; PHYSIOLOGY; PSYCHOLOGY; REHABILITATION OF THE DISABLED.)

Psychological Warfare

Psychological warfare was not a new creation either of modern militarism or of the totalitarian state, any more than the control of men by persuasion, emotion or suggestion was unique to the period of World War II. Genghis Khan, in his great conquests, spread defeatism and divisionism among his enemies through his secret agents before launching his military attacks. What was new, however, was the systematic and thorough-going exploitation of techniques of propaganda and subversion. Psychological warfare in the hands of the nazis was more completely organized, more centrally directed, its techniques more elaborately developed and its functioning better geared to diplomatic and military policy than ever before.

The Nazi Technique.—The nazis came to power in Germany as exponents and practitioners of the art of propaganda. Their seizure of the state was relatively bloodless and could not be represented as the victory of an armed uprising. It was rather the triumph of power politics, the successful use of a show of force, the victory of techniques of mass suggestion. The nazi leaders made no fundamental distinction between the use of propaganda to consolidate political power internally and its use in international psychological warfare. As past masters in its use, they proceeded to pave the way for their armies long before the outbreak of hostilities in 1939.

The nazis distinguished two main strategic objectives of psychological warfare, (1) the winning of converts to the nazi cause and the subsequent sustaining of their faith and (2) the paralysis of organized opposition through the creation of doubt, uncertainty, confusion, suspicion and fear. Perhaps their greatest success outside of Germany was in weakening French national unity and spirit so that France was easily overrun by the wehrmacht.

The assumption fundamental to nazi propaganda-strategy was the belief that the masses of people everywhere were psychologically sick personalities, moved by emotion, irrational hopes, longings, desires and fears. But Goebbels and Hitler were astute enough to realize that man's emotional nature is cloaked by his reasoning process. Hence nazi propaganda, while appealing basically to feeling, was careful to affect a plausible and rational guise. To the non-German, the speeches of Hitler seemed like the rantings of a madman to his mentally deranged henchmen. Careful analysis, however, shows the care and attention the nazi propagandists gave to the appearance of rationality with the primary objective of appealing all the more powerfully to the emotions.

On the emotional side, the nazis assumed that the deep longings of the frustrated German of their generation for material well-being, security, power and prestige were typi-

cal of the masses the world over. The masses, moreover, were feminine in their psychology in that they wished to be led and dominated in attempting to satisfy their aspirations. Nazi propaganda thus had to exemplify the spirit of mastery. It had to be forceful in content and presentation; it should at times employ rough, coarse, harsh language, attack constantly, express the dynamic determination of the nazi leaders, employ the right doses of terrorism, and should occasionally utilize brutality and cruelty. The readiest means of arousing strong, common emotions among frustrated people was through a psychology of hatred. This the nazis sought to do with dramatic recitals of wrongs suffered by the people and the stimulation of aggressive impulses against the wicked and malignant evil-doers. On the positive side it was important to create a fanaticism of faith. Emotions of righteousness had to be attached to the word of the leader and to the simple principles of the nazi creed. Techniques of mass suggestion, constant repetition and slogan thinking were all employed to implement the evoking of deep-lying emotions.

On the rational side, the strategy was to aim for a superficial plausibility to prevent the arousal of true critical thought. An important device for this purpose was the manufacture and manipulation of objective events to accord with propaganda themes. To make the communist threat more real, the nazis had the reichstag building destroyed by fire. When they achieved power, they were able to manipulate foreign policy and domestic affairs to corroborate their verbal claims. Attempts were also made to establish authenticity by quoting from eyewitnesses or by dragging in statements from obscure sources; for example, some unknown Bulgarian newspaper or French journal already under nazi control. The Germans, moreover, sought to make their stories appear reasonable by creating an atmosphere of consistency. This was extremely difficult, because their divisive and dissolvent propaganda was aimed at different groups in the population and contained many self-contradictory messages. Nonetheless, by stretching and distorting, the nazis tried to give a rational framework and philosophy to their propaganda. The technique of the prototype, or *Vorbild*, was the device used. It involved the construction of an ideational model on such comprehensive and extreme terms that it gave a framework for many stereotyped conceptions. For example, a prototype of the plutocratic, evil British leader was built up by the German radio into which all the errors and weaknesses of British policy and history could be fitted and to which all accusations against Germany could be referred and refuted.

France the Main Target.—The greatest application of German psychological warfare came before the real war in the west and was aimed first at weakening the will of the European democracies to fight, and later during the "sitzkrieg" at creating false feelings of security. Just as the genius of Hitler on his rise to power in Germany lay in his perception of the rottenness of the German social structure, so he saw clearly the weakness of the European democracies, torn by class discord, divided by political and economic dissension, imbued with pacifism. France, as the most demoralized country of Europe and as the most powerful continental enemy in the west, was the chief target.

The principle of audience stratification was fundamental in nazi strategy. Much of their propaganda was not aimed at Frenchmen in general but was differentially pre-

pared for the various strata in French society. The logic of this approach was that it permitted the most complete exploitation of the beliefs, fears and attitudes of the many groups making up a nation. The upper-income groups who had the most to lose from any revolutionary change were quietly approached through nazi agents and nazi sympathizers who represented fascism as the best protection for their privileged positions. It must be remembered that for the upper classes in Europe the spectre of communism and revolution was not imaginary. Socialistic and communistic movements had strong mass support; soviet Russian precept and example were ever present, and the capitalistic system lacked the youth, vitality and margin of safety characteristic of U.S. economy. Not only were there native fascist movements openly operating as such in England and France, but there was unconscious sympathy with some aspects of fascism in high places. After all, Hitler had smashed communism in Germany, had liquidated the labour unions, had preserved law and order and property rights.

To the French workers, the nazis stressed the futility of the sacrifices and destruction of an imperialist and capitalist war. Why should the common man bleed and die in a plutocratic war which filled the pockets of the rich? The nazi appeals also capitalized upon the anti-militarism and pacifism of the French masses. What quarrel did the French workers have with the German workers? A strong military could be looked upon as the army of the people, but it could also be regarded as the repressive agent of the reactionary elements in the state, and the German propagandists did not overlook the latter theme.

While the French upper classes were reached more directly through agents and sympathizers, the middle classes were the target of the written and the spoken word. Their own small holdings made their security more precarious than that of the moneyed groups and so made them more apprehensive of any fundamental change, whether war or revolution. They were especially susceptible, moreover, to one of the most common nazi dissolvent techniques, anti-Semitism. The success of this weapon was due to the clever nazi exploitation of elementary psychological processes. The victims of the propaganda were people emotionally upset and insecure who lacked thorough knowledge and penetrating insight into the real causes of the national and international crises affecting their lives. Moreover, the correct localization of the real causes meant the facing of unpleasant and difficult truths, including the terrible catastrophe of another world war. Thus, if the pent-up emotions and anxieties could be released against a plausible scapegoat, people could apparently get rid of their troubles without the dangers and hardships of a war or revolution. The Jews were few enough in number to afford a safe release but conspicuous enough to be targets. Moreover, the nazis went to great pains to show that it was the Jewish international financiers who were plotting war, and it was the Jews in the nation who were the war mongers. And to the middle classes the Jews were presented as the big capitalists taking advantage of the smaller people, almost in the same breath as the Marxists, who were undermining the social order and agitating for revolution. Anti-Semitic propaganda was carried on first by supporting native anti-Semitic organs with encouragement, ideas, examples and funds. Then, as the war grew nearer, the streets of Paris and other cities were littered with violent leaflets printed in Germany.

Another form of dissolvent propaganda used by the

nazis internationally was also directed at France, namely racial and social separatism. German agents were at work in Alsace and Brittany fostering separatist movements. The Breton paper, *Breiz Alao*, reflected not only Breton aspirations but the main themes of German propaganda.

To achieve their purposes, the nazi masters of psychological warfare maintained a network of espionage and subversive agents in France. Their methods varied from infiltration into polite society to actual political crimes. They were adept in planting and developing rumours which would either support their propaganda themes or serve to confuse the French people. They were liberally supplied with funds and used them effectively. In the summer of 1939, Premier Édouard Daladier finally started a counteroffensive. The news editor of the semiofficial *Temps* and an advertising executive of the patriotic *Figaro* were arrested for accepting bribes from the German government to do espionage and propaganda work. The extent of the German infiltration was evidenced by the fact that Daladier's speech in the French chamber mentioning the existence of the network of "propaganda, espionage and worse things" was expurgated by the French appeasement press.

The objective of stimulating the selfish interests of segments of the population, encouraging class warfare and fomenting racial and social separatism was twofold: an immediate national indecision and paralysis in time of crisis, and a long-lasting social decomposition which would make difficult the rebuilding of national spirit even in war. To achieve this demoralization, the nazis not only set group against group but worked zealously to undermine confidence in government officials, in the printed word, and in other accepted channels of authority and social control. Lawlessness was encouraged, and events like the crash of the Mendelssohn bank were played up to destroy faith in national institutions. The contradictions between official French policy and French concessions to Germany were exploited. A false-news phobia developed in France as the Munich crisis ripened in which the people and the press refused to believe truth and fiction alike. Everything was regarded as propaganda no matter what its source or its content.

The dissolvent propaganda working from within was but one phase of German psychological warfare. German foreign policy and the actions of German officials were manipulated to produce a war of nerves. The strategy was the constant creation of crises in international events.

In their skilful conduct of the war of nerves, the Germans would often rely upon the press in the democracies to do their work for them. An official German speech or a semi-official statement in the German papers would be seized upon for its news value and reproduced and given headlines in France or England. Sometimes the technique was a calculated indiscretion revealing German military or diplomatic plans to the enemy intelligence services. Paris and London thus had knowledge of the plans for the occupation of the Rhineland, Austria, Czechoslovakia and Poland weeks in advance of the actual event.

During the first phase of World War II, when the German armies were occupied in the east, the object of psychological warfare was to hold the line in the west by creating false feelings of security among the western Allies. Fraternization, propaganda and tactful resistance to limited French advances were employed. In places where the German troops withdrew from their frontier posts, they left placards with such messages as, "French soldiers, we have no quarrel with you. We shall not fire unless you do."

Until they were ready to strike in the west, the Germans

Leaflet urging German soldiers to surrender with safe-conduct passes, dropped behind German lines by soviet planes in 1942. At the top are newspaper notices of German soldier deaths, and to the right, a caption tells of the mourning at home ending, "Do you really wish to see YOUR name in the papers within black borders one day?" Below these are photographs found on dead German soldiers

strove to maintain the appearance of a "phony" war, with many acts of concern and chivalry toward the French in the front lines. The pretense of wanting peace did not deter the German propaganda machine from its exploitation of terrorism in threats to wipe out Paris by air attack, and in hints of a secret deadly weapon.

Methods Used in the United States.—Similar techniques were employed against the United States before that nation's formal entry into the war. A definite effort was made to divide and confuse Americans by short wave programs aimed at different interest groups in the United States. In this attempt at stratifying appeals directed at the frames of references of the various U.S. publics, programs were instituted for housewives (Zeesen Women's Club), the intelligentsia (The College Hour), midwesterners (Dear Harry and the Folks Back Home in Iowa), business men (Economic Review), the upper classes (Constance Drexel), anti-Semites (The Jew in American History), white collar workers (Gertie Hahn), the unemployed (Jim and Johnny), New Yorkers (Mr. Okay),

scandalmongers (Political Cabaret). Studies by the Princeton Listening Centre established, however, that these programs never achieved any sizable listening audience in the United States. The U.S. public was too fixated upon domestic variety programs to bother about trying to get German short-wave broadcasts. The German short-wave had some effect, nonetheless, in reaching its sympathizers and feeding them psychological ammunition. German Bundists and native fascist groups followed the propaganda line of the broadcasts, and U.S. counterintelligence measures identified nazi fellow-travellers through the careful analysis of German propaganda themes by the monitoring service of the Federal Communications commission.

German attempts to preserve U.S. neutrality resembled its methods on the continent but were on a reduced scale. Its diplomatic and consular services in the United States contained agents whose main function it was to influence U.S. business men in Germany's favour and to get accounts from the German point of view into books, pamphlets, magazines and newspapers. The German Library of Information was set up in the United States in 1937 by the German propaganda ministry. Other nazi propaganda agencies in the United States appeared under the names of the German Railway Information service, the German-American Chamber of Commerce, etc. German inspired and financed propaganda had some slight measure of success. Its messages, for example, occasionally found their way into congressional speeches.

German short-wave broadcasts to the U.S. and the activities of the German Library of Information were negligible compared with the clever use of the U.S. press by the nazis. The main device of Goebbels for getting space in the U.S. press was to utilize the actions, anticipated actions, speeches or probable speeches of officials of the German nation. Thus, while a U.S. newspaper would quickly reject a direct handout from a nazi press agent, the actions and statements of German officials were regarded as news. U.S. correspondents in Germany felt compelled to file such stories or find themselves scooped by a representative of a rival paper.

The nazis were also adept at story planting. While U.S. correspondents were still in Germany they were occasionally permitted to observe activities about which they could cable their papers. But what they were permitted to see was so arranged as to plant an idea or an inference for their reports. Thus, in May 1940, the Germans allowed selected correspondents to travel with the armies and to see at headquarters what appeared to be important maps suggesting the plans of the high command. At the moment the Germans were really preparing to sweep south against Paris, they saw to it that U.S. reporters convinced themselves that the attack would be across the channel against Britain. Neutral capitals in Europe were the main source for planted stories, and both sides used the press in cities of neutral states to confuse and deceive their enemies. In fact, neutral countries remained until almost the end of the war the psychological battleground of the belligerents for espionage, counterespionage, subversion and propaganda.

German psychological warfare failed to achieve any success in the United States comparable to its victories in Europe. One important factor in this failure was not the superior acumen or wisdom of Americans but their better individual morale. The nazis had had for their victims in Europe both inside and outside of Germany, people easily confused and browbeaten because of their

privation, suffering and basic defeatism. Americans, because of their political and international naïveté, were also easy to confuse, but on the other hand they were difficult to terrorize because of their more fortunate political and economic heritage.

Japanese Use of Racial Propaganda.—The Japanese borrowed much from Hitler, including many pages from *Mein Kampf*. Their propaganda machine and fifth column tactics paid rich dividends. Outstanding in their propaganda was the favourite nazi theme of racism, modified slightly to make the yellow skin superior to the white and the Anglo-Americans rather than the Jews the scapegoat. The Japanese cry was "Asia for the Asiatics" and they held out promises to the Burmese, the Malaysians, the Hindus, the Filipinos for a place in the "Asiatic co-prosperity sphere." To many of the peoples of the east, Japanese appeals made all sorts of sense, for they had long been subject to the economic, social and in some cases political domination of the whites. The Japanese made much of the U.S. treatment of the Negro, and they eagerly seized upon the Detroit race clashes and exaggerated them into a major race war. Though many Burmese went over to the axis side, and Malayan soldiers deserted to the Japanese, and even Filipinos were affected, the Chinese continued to resist their "liberators" with all their power.

British Use of Psychological Warfare.—The democracies were at certain disadvantages compared to the dictatorships in the use of psychological warfare, and Great Britain was no exception. The Germans could co-ordinate their psychological with their military and economic weapons. The distrust of propaganda in government hands in the democracies, however, restricted it to a very minor role and a role often not integrated with military action. In Great Britain, the ministry of information was not represented in the cabinet and did not enjoy the full confidence of the military services. So poor was the rapport between the military and the ministry of information that official British broadcasters trying to rally a world audience to the Allied cause often did not have as much information on the course of military events as appeared in the private U.S. press. The difficult position of the minister of information in England led to a succession of ministers in the early war years and to the feeling that the ministry was the graveyard of political careers. In the United States, too, the Office of Facts and Figures was an orphan which after a short period of abuse was pushed out of the way for the step-child, the Office of War Information. None of the democratic states devoted a fraction of the resources to psychological warfare that Germany invested.

Before the United States' declaration of war against Germany the British were active in presenting their case to the American people. Their policy, however, was not to try to propagandize the U.S. directly by fabricated emotional appeals. They were content to present facts and interpretations without appeals for help. There was no rigid ideological line laid down to which British spokesmen had to adhere. The British Broadcasting company turned its microphone over to representatives of all segments of English society and allowed them to tell the U.S. their stories with little regimentation. Thus, British speakers would often show inconsistencies of interpretation; from Hugh Walpole's Christmas card picture of charming England to J. B. Priestley's class-conscious version of English society at war. Some English broadcasters condemned the German nation as a whole; others were careful to distinguish between the German people and the

nazi leaders. Though the lack of a central ideological theme contrasted strikingly with the crisp, definite goal of the nazis, the more democratic and intellectual British presentation had a freshness and convincing quality compared with the cut-and-dried mouthing of nazi stereotypes. U.S. sympathies were won most completely not by high-pressure sales methods but by the tales of the simple, unaffected heroism of the English people under the ordeal of bombing.

The British story to the rest of the world was similar in nature to her informational campaigns directed toward the United States. In reaching the people of the western world, the nazis were constantly on the offensive. They spoke as the representatives of a new revolutionary cause and they held out new symbols to crystallize discontent and aggression. The British answers were a tame defense in that they had no new slogans, no new formulae. They fell back upon the old concepts of political democracy and Christianity. But British tenacity and courage helped to hold the psychological as well as the military front in the dark years of the war.

The United States and Psychological Warfare.—In the United States, as in Britain, the distaste for propaganda and the feeling against government competition with private industry in news services meant a belated preparation of the "fourth fighting arm." It was not until five months before Pearl Harbor that President Roosevelt created the Office of Coordinator of Information to channel U.S. news to the outside world. And it was not until seven months after the United States was actually at war that the Office of War Information was established. OWI was given the task of public propaganda abroad. Its broadcasts and printed materials were openly addressed to enemies and neutrals. The undercover and subversive aspects of psychological warfare were reserved for the Office of Strategic Services, functioning under the joint chiefs of staff. The undercover work of OSS was often psychological warfare or closely related activity. It carried on espionage in axis and axis-controlled countries, fed the axis false intelligence, aided the underground movements by furnishing them with supplies and arms, by directing their sabotage and by giving them propaganda materials and plans.

The overseas task of OWI was twofold: (1) the broad strategic purpose of reaching the minds of the people in other countries with accurate and adequate information about the strength, vitality and determination of U.S. democracy to hearten the United Nations and to discourage the axis powers and (2) the specific tactical objective of demoralizing axis troops in designated areas and facilitating their surrender. In carrying out the first objective, radio programs in 40 different languages or dialects were beamed to all parts of the world. The "Voice of America" constantly presented hard factual news about the war to information-starved people in axis and axis-controlled countries, together with documented accounts of the U.S. way of life.

The second tactical objective was achieved through the Psychological Warfare Branch of the army. This was an administrative device for integrating psychological warfare activities in combat areas. It was made up in part of British operatives, of OSS and military personnel, but dominantly of skilled and trained OWI specialists, operating under the theatre commander. Combat teams from PWB worked in the front lines with mobile presses, with radio and with sound trucks. OWI also had a home-front function, not of general propaganda to the American people, but of combating nazi tricks in news distortion

A dangerous salt shortage in Burma during 1945 prompted the OWI branch of psychological warfare to drop two-ounce packets of salt on Burmese villages

and of publicizing specific governmental campaigns such as war bond drives, salvage campaigns and blood-donor drives.

In the first stages of the war, OWI propaganda was on the defensive. It sought to counteract the myth of invincibility of the German new order and the weakness of the "decadent democracies." Especially in Australia and China was U.S. propaganda a shot in the arm to peoples who had suffered a succession of defeats and seemingly faced annihilation.

U.S. propaganda activities took the offensive as its military campaigns got under way. In North Africa the Psychological Warfare Branch had two assignments: to break the morale of the axis troops and to protect the rear of the Allied forces by winning over the native populations. PWB in the Mediterranean theatre used radio, leaflets, photographs, publications, motion pictures, public address systems (or mobile units). Almost 10,000,000 pamphlets were dropped on axis troops in the last ten days of the African campaign and helped in the rapid collapse of the army under Juergen von Arnim. In Tunisia, a black-market developed for the safe-conduct PWB leaflets because of the readiness of the Italian soldiers to surrender. Not only were leaflets showered on axis troops from the air to prepare their psychological demoralization, but combat teams in the front lines produced their own tactical leaflets on their mobile presses which could be disseminated by base-ejection shells to the specified areas designated by army commanders. An OWI radio engineer was instrumental in effecting the surrender of the Italian fleet by switching a PWB radio transmitter in Algiers to the international distress frequency listened to by ships at sea and directing the Italian warships to designated Allied ports.

In the Pacific area, propaganda was directed not only at the Japanese people and soldiers but also at the Japanese leaders. PWB carried out a constant campaign of ridicule against the Japanese admirals who would not come out and fight. Some military authorities credited this campaign as an important factor in forcing the Japanese navy into its disastrous battle of Leyte gulf. The importance of U.S. propaganda for the Japanese leaders was indicated by the fact that as the war progressed the Japanese printed every important U.S. broadcast in a

daily digest for 500 top political, industrial and military leaders. The careful attention of both countries to the propaganda lines of its opponent made for an indirect form of communication which furnished a new type of machinery for preliminary unofficial peace feelers.

Psychological warfare in the hands of the Allies had no spectacular success comparable to the Nazi weakening of France before the blitzkrieg. Allied propaganda did not so much undermine axis morale before military attack as it facilitated victory and made possible the full exploitation of military success. Moreover, it proved of great usefulness in reviving and maintaining the spirit of the people in axis-controlled countries during the critical period between the U.S. entry into the war and the arrival of U.S. might on the front lines.

Though the emphasis in this account has been upon propaganda and diplomatic techniques which were clear-cut examples of psychological warfare, it is true that no sharp line can be drawn between psychological and military warfare. The German conduct of military campaigns was compounded of both military and psychological concepts. This was clearly apparent at the simple level of specific stratagems, as for example the use of screeching dive bombers to break the morale of unseasoned troops, or the device of exaggerating the strength of artillery and mechanized forces by wooden guns or other faked weapons. But the very conception of the use of military power was psychological in nature. The propaganda effect of blitzkrieg depended upon some objective basis in fact of sudden, devastating and irresistible force.

Psychology

Although World War II cut heavily into traditional research of the pure-science type and reduced the number of professional psychologists in graduate training, it nevertheless stimulated the growth of psychology and acted as catalyst to vitalizing trends within the youngest of the natural sciences. In numbers alone the record was of interest. In 1935 the American Psychological Association, professional organization of psychologists in the United States, had approximately 1,800 members and associates. In 1945, still a war year, the number had jumped to about 4,300. The trend toward psychology was apparent in the heavy registration for psychology courses in U.S. colleges and universities both by returning servicemen and by civilian students. A fairly typical study at the University of Illinois traced the percentage of students electing various fields for their major concentration over a period of years. In 1934 psychology majors comprised only 3% of all majors in the college. In 1944 the number had grown more than fourfold to 13% of all majors, and 1947 figures would undoubtedly show a further increase.

War agencies and the armed services utilized psychology to a much greater extent than in World War I. In Jan. 1944, 64% of the male psychologists between the ages of 18 and 38 in the United States were in military service as compared with about 50% of the general civilian population in the same age group. And the great majority of this number were employed in a professional capacity. Moreover, of the psychologists not in uniform, 12% had been working on a full-time basis for government war agencies and 9% on a part-time basis. In addition, many

of the psychologists in the universities were working on research for the armed services through contractual arrangement with the Office of Scientific Research and Development.

General Trends

Two basic trends in psychology, accelerated by the war, were: (1) the extension of its subject-matter to give focal attention to behaviour at the integrated level of human action (motivation, personality and social relations), and (2) an increasing shift away from an elementaristic Newtonian approach to a dynamic, field-theoretical point of view. The older psychology was elementaristic in subject-matter in that it tended to concentrate on elementary physiological functions, on reaction time, on the sensory processes. Even the larger problems of learning, memory and judgment were approached in their simplest dimensions: the time it took to learn a list of nonsense syllables, the counting of errors in running a blind-alley maze, or the minimal differences that could be accurately estimated in lifting weights. This elementarism of the subject matter studied was paralleled by an atomistic methodology. Facts were studied in isolation, and the complex of forces affecting the processes under investigation were frequently ignored. Thus even the early radicals interested in the larger problems of personality and social relationships studied personality traits in isolation from the pattern of personality, or described the mechanism of social facilitation in crowd behaviour as if it were an independent and all-important determinant regardless of the context of the situation.

This early elementaristic emphasis was in good part an attempt to make psychology scientific. Just as Newtonian physics had been the early scientific approach in an older discipline, so a rigid atomism became the tradition of the younger science. Moreover, it held on because of the greater danger in the psychological field of a pseudo science in the too-ready embracing of complex problems, for the solution of which there was so much practical pressure. Nor was the danger imaginary, for popular psychologizing often supplied answers lacking in documentation. This served all the more to drive scientific psychology into an ivory tower and a search for experiments which would be rigorously exact but of little theoretical or practical significance.

The development of a psychology which could cope with problems at its own level without the sacrifice of scientific rigour was in part a gradual maturing within the field and in part the result of the depression years and World War II. Historical events gave psychology a changed perspective. Psychologists called upon to meet complex problems in times of crisis found that complexity was amenable to the scientific approach, and they returned to their laboratories with a new orientation. But the main vehicle of change was furnished by two great intellectual movements in the western world, Gestalt psychology and Freudianism. The early contact between these movements and U.S. psychology had created a few zealous converts, considerable active hostility and much indifference. Renewed contact led to increased controversy, and a great deal of effort was expended by both sides in a war of words. Traditional U.S. experimental psychology was highly critical, and not without justification, of the cult-like nature of these new schools of thought, of their lack of quantitative controls, and of their failure at rigorous definition of terms and concepts. But originally it failed

to grasp the essentially new way of scientific thinking in these movements, obscured as it was by unclear concepts, evangelical enthusiasm and other imperfections. Basically both Freudian and Gestalt psychology were part of the scientific revolt against static Newtonian principles, a revolt already a successful revolution in the older fields of science. The new conception sought not simple point-to-point correlations between isolated factors but the dynamic relations within a complex field of forces. This approach demanded that the relevant system of events be studied in its totality and that the predictive test be not one of finding the absolute weighting of single factors but of predicting the trends within a given event-system.

Effect of Gestalt Psychology.—In spite of continuing opposition at theoretical levels, the 1930s and 1940s saw the success of a process of infiltration in many specific lines of experimental investigation. The exodus of German psychologists from Nazi Germany helped, since they carried on their research in U.S. universities with U.S. co-workers (Wolfgang Köhler at Swarthmore, Kurt Koffka at Smith, M. Wertheimer at the New School for Social Research, Kurt Lewin at Iowa).

Typical examples of changes in the classical topics of psychology follow: (a) *Learning*, formerly dominated by mechanistic association, now recognized the role of meaning and insight—the sudden solution of problems through grasping the meaningful relationships. Köhler's old experiments on the modification of behaviour in the anthropoid apes through insight were confirmed by studies of humans and other animal forms. The superiority of insightful learning to rote memory was demonstrated by G. Katona. Subjects who understood the principles of various puzzles had perfect retention of the solution after the lapse of a month, whereas those who memorized only the solutions showed marked forgetting within the same period. (b) In *memory* the purely quantitative treatment of retention was modified to take account of qualitative changes which occur because the individual assimilates material to his particular patterns of meaning. The memories which an individual takes away from a situation are not a mere summation of the stimuli and temporal exposure but a function of his creative moulding of incoming impressions to his own framework of thought. (c) The greatest acceptance of Gestalt findings and concepts occurred in the field of *perception*. The modern textbook discussed the importance of the organization of the perceptual field, the determining effect of context, the nature of figure-ground relationships. Discriminative responses to the larger, greater or brighter of two stimuli came to be regarded as response to perceived relationships rather than to fixed stimulus-values. Experiments on figural aftereffects showed that the perception of shape and form is dependent upon the total experience of the present and immediately preceding visual fields. (d) Basic *biological drives* must take account of the relativity of appetite. The apparently physically satiated animal resumes eating when other animals are introduced into the situation; and the apparently satiated animal with part of its unconsumed meal before it will begin eating again if the food is taken away and immediately replaced.

While laboratory psychology in its absorption of Gestalt findings was undergoing gradual change, the more palpable transformation was in social psychology and the study of personality. The complex functions of social motivation, of personality integration and of group behaviour could not be adequately studied by mechanistic elementarism. Hence when Lewin in his field theory extended Gestalt conceptions into this area, they met with

ready acceptance and led to immediate research growth. Group effects were investigated not in terms of the mere increase in social stimulation in the group but in terms of group atmosphere and organization. Democratic group-structure produces less interpersonal hostility and scapegoating than authoritarian group-structure and, moreover, is much superior in motivation and resulting performance. In the authoritarian group, reward can only be attained competitively by praise from the leader, whereas in the democratic group reward can be enjoyed by all since it comes from accomplishment in the task. Aspiration levels proved a fruitful concept to measure the purposive, integrated strivings of personality. Discrepancy between aspiration and achievement levels became a valuable index of personal frustration. Leadership when used as a relational term to describe the relations between leader and follower does away with the search for some mystic personality quality of leadership. In this contextual meaning the leader must possess membership character in the group he is leading, in terms of similar traits or similar values to those of his followers, as well as definite superiority to the group in other characteristics. Research studies showed that the relationship could be dominative between leader or follower or integrative, with the integrative type having better natural chances for surviving.

Effect of Freudian Theories.—Freudian and Adlerian doctrines, although older than Gestalt conceptions, took an even longer period to affect U.S. academic psychology. Since Freudian theory developed outside the laboratory and since its ideological aspects were sometimes difficult to separate from its scientific features, its fundamental methodological contributions did not have a thoroughgoing influence on traditional psychology until the 1930s. This came about in two ways: one indirect, the other direct. Psychiatrists, clinicians, and practitioners of all sorts found its ideas and techniques extremely useful. Abnormal texts, personality treatises and even general texts, though written by academic psychologists, often hostile to anything labelled Freudian, unwittingly employed many of the mechanisms of human behaviour described in the clinical literature and derived from Sigmund Freud. Thus, even while Freud was rejected in name, standard writings mentioned identification, projection, displacement, fixation, regression, sublimation, compensation, rationalization and defense mechanism. The second way in which Freudianism made itself felt was at a more direct and deliberate level of acceptance. Clinical and social psychologists evaluated Freudian doctrines systematically, revised them and applied them to their problems. The result was a neo-Freudianism which retained Freud's dynamic point of view and his emphasis upon developmental processes, sought the validation of hypotheses in research, and rejected any unverifiable assumptions about sex in the older Freudian system. The emphasis was not upon rigid stages in personality development but upon the importance of the socialization process as an interaction between the child and the institutional demands of the culture implemented through human agents. Leaders in this movement were A. Kardiner and K. Horney.

The right wing of this movement appeared in attempts, centring at Yale University, to find simple experimental analogues of Freudian mechanisms, or to formulate simple hypotheses suggested by Freudian psychology for research verification. The best-known attempt was the frustration-aggression formula, tracing latent and overt hostilities to the thwarting of either biological or ego drives. These

Self-analysis was advanced as one of the methods of experimental depth psychology by Dr. Werner Wolff, expatriate German psychologist in the United States, in his book *The Expression of Personality* (Harpers, 1943). In one test, the subject was asked to comment upon two composite photographs of himself, taken without his knowledge. The portrait was split down the middle, reversing one half, and fitting it against the remaining half. The subject's reactions to his "left" and "right" faces, usually strongly negative or positive, provided definite clues to his personality, according to Dr. Wolff

efforts, though too atomistically conceived, were leading to more sophisticated research.

Related to the broad sweep of field systems such as Gestalt and Freudian psychology was the more native development of purposive behaviourism and event-system theory. E. C. Tolman and his students explored motivational problems on the molar, as opposed to the molecular level, and considered actions in the broad context of the purposes served. Thus Tolman demonstrated the fallacy of simple reward-punishment associationism by an experiment in which subjects shocked electrically for making the right responses learned as readily as subjects shocked for making the wrong responses. In the broad context of mastering the whole problem, punishment for specific actions served not as punishment but as an effective signpost for successful learning. F. H. Allport, independently of Gestalt workers, formulated an elaborate event-system theory to provide methodological concepts and tools for a more scientific approach in social psychology. This system, though a major contribution, was not as effective or as useful as Lewinian field theory, in good part, because

662 of the forbiddingly difficult nature of its language and formulation.

An important tool for the study of complex dynamics came from R. A. Fisher's factorial design, a method for the study of a number of independent variables in their simultaneous interaction. It was based upon computing the variances contributed by the component forces. The experiment was so designed that there was an experimental situation to represent every possible combination of factors being studied. The advantage of the method was in its economy, (several experimental factors could be studied simultaneously) and in its greater fidelity to real situations in which a number of factors exerted their influence in simultaneous interaction.
